THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING.

IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze; for the man, too, who honestly plumbs a jamb. . . . . .

EFFINGHAM HOUSE,
ARUNDEL STREET, STRAND,
LONDON.

CONTENTS.

ABATTOIR, Inverurie, 179.
Abbey : Basingwerk, 541 ; Battle, Cloisters of, 44 ; Field, St. Augustine's, Canterbury, Excavations at, 552 ; Church Malmesbury, 465 ; Paisley, Restoration, 281 ; Welbeck, 458 ; St. Mary's, York, 163.

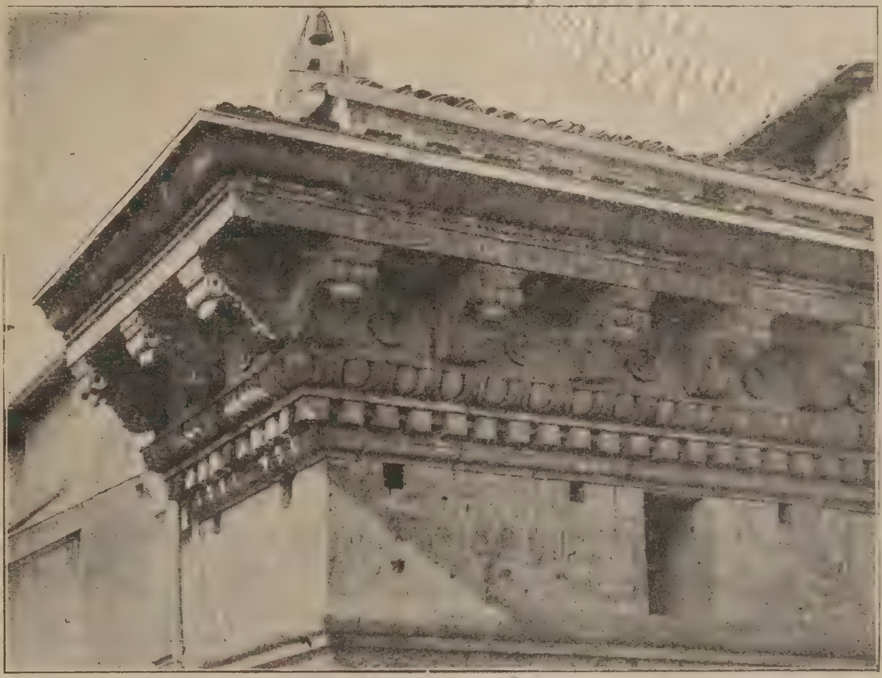
Effingham House,
Arundel Street,
Strand, W.C.

An Architectural Causerie.

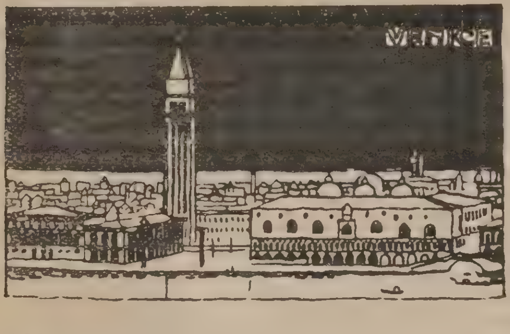
"The Gates of Paradise." The birth of Renaissance architecture dates roughly from the competition for the Baptistry gates in Florence. Long before this time there had been signs indicative of a change. Giotto and Taddeo Gaddi his pupil, with others, had broken away from the traditions and conventions that had been the rules for painters, sculptors and architects, but it was for the few enthusiastic goldsmiths who entered this competition to thrust on one side, almost violently, the ideas of their immediate forerunners. The competition, promoted by the Priors of the Art, was open to all the goldsmiths and sculptors in Florence. They were to model in relief a single panel of the "Offering up of Isaac," and a whole year was allowed them for the task, which was to a great extent simplified by the fact that they were to follow an earlier gate executed by Andrea Pisano. Nearly a dozen of the young goldsmiths entered the competition, and most of them became famous in after years. It is interesting to note here how many architects and sculptors of the Renaissance emerged from the goldsmith's shop; its influence is most marked in much of the early work. (In Spain early Renaissance was called Plateresco, or gold and silver plate work.) When the time came for examination and award, the judges found themselves at a loss to decide between the merits of two young men and a mere stripling—Ghiberti, Brunelleschi and Donato, afterwards called more familiarly Donatello. Brunelleschi and Donato decided the matter; when they saw the work of their rival they both stepped aside, declaring that the prize must be adjudged to Ghiberti for the honour of Florence. Ghiberti was very greatly influenced by the wave of naturalism which had transformed painting into a living art. With great daring he seems to set aside every rule and convention, to make splendid revolt against the canons of ecclesiastical tradition, which the earlier men had put more gently aside. It is doubtful whether he chose the most effective method for the decoration of the gates, which seemed to some of his contemporaries worthy to be the portals of Paradise. There was undoubtedly something in his art which dazzled and subdued them by its absolute newness. The very joy of life carries him out of bounds, even to the forgetfulness of his material. He seems to wish to transfer the effects of painting to bronze, and in the larger pictorial panels manages to introduce upon almost flat surfaces scenes and groups on different planes of perspective—landscape effects, with all the accessories and details, except the colours. His literalism and want of simplicity is annoying, yet there is such exuberant delight in the work, such a mastery of detail, and such a love for birds, squirrels and flowers that we almost too readily forgive him; standing at a distance, nearly all the delicate modelling is lost, and the arrangement in the architrave of the groups of birds and beasts among flowers and foliage is confusing. The suggestion of growth so often found in mediæval work has no place here, and the change from one mass of foliage and beasts to another variety is almost clumsily achieved by tying them together with ribbons, a favourite but stupid method copied by less able men who came after him. He was the first sculptor to introduce perspective into his art. He treated everything he touched with the skill and delicacy of the goldsmith, and made some famous jewellery—a single precious button for a Pope, or such a ring as that of Giovanni de Medici, a cornelia from Nero's treasury, set as a winged dragon emerging from a cluster of ivy leaves. Ghiberti's work, and his gates particularly, show perhaps more than any other great craftsman of the Renaissance the influence of his training in the goldsmith's shop. It is full of charm and refinement in detail, and is really the work of a Greek, revelling in nature, forgetting his serenity in the joy of re-creating in material the wonders of bird, foliage and animal life.



CORNICE, PALAZZO DEL GOVERNO, SIENA. DATE 1469. ROSSELLINO, ARCHITECT.

Brunelleschi and his Dome. There was a great work to do in Florence. The problem of covering the vast octagonal opening and the three apses of Santa Mari di Fiore was still unsolved, and the great church was doomed to remain unfinished till someone should come with greater daring than the feeble theorists who proposed to fill the space by first building up a mound of earth and then placing a dome on top of it. Filippo Brunelleschi was the man to do it; he saw the task awaiting him, and in order to prepare for it went with Donatello to Rome, where they worked together in the same goldsmith's shop, studying hard and working in gold and silver. Donato eventually went back to Florence, and Filippo was left alone in Rome, where he laboured continually among the ruins and studied more industriously than ever. He drew the details of every kind of building—round, square and octagon, basilicas, aqueducts, baths, arches, and the Coliseum and Amphitheatre—in which he especially examined the methods of building and clamping. He also pondered over the difficulties involved in the vaulting of the Pantheon, and whenever he found fragments of capitals, columns, cornices or basements of buildings buried in the earth he employed labourers to dig them up so that he might examine them. When Brunelleschi came back from Rome the Board of Works, hearing of his studies, sought his advice. Now was Brunelleschi's chance, and he seems to have gone to work very warily, for the chronicler tells us that if the master-builders had seen difficulties Filippo showed them far more. And someone asking, "Is there then no mode of erecting it?" Filippo, who was ingenious also in discourse, replied that if the thing were really impossible it could not be done. On hearing this, we can imagine that the Board of Works came very near despair. The wise Filippo, however, went on to surmise that "there ought to be someone in the world who could do the work, and seeing that it was a religious edifice the Lord God, to whom nothing was impossible, surely would not abandon it." The Board of Works pondered these sayings, and on May 7th, 1417, voted to give to Filippo di S. Brunelleschi for his labour in concerning himself about the cupola ten golden florins. In the following year the matter was thrown open to public competition, and fifteen models were presented. Brunelleschi's was of brick, and in its construction he showed how, by an invention of his own, a dome might be built without centering. He wrote a paper describing his plan. His method was to build two octagonal domes or cupolas, separated by a space so as to allow a passage or stairway, united by eight strong ribs of masonry at each angle and by sixteen smaller concealed ribs on the face of the vault. The paper finishes with this straightforward and workmanlike suggestion: "Above the height of 30 braccia (about 57ft.) let it be built in the way that shall be advised and resolved upon by the master who shall then be in charge of it, for in building practice teaches what is to be done." The old chronicler says that "he showed himself as sure of what he said as though he had already built ten cupolas." For months the Board of Works could not trust themselves to come to a decision, and when they finally engaged him stipulated that he was only to build it up to 20ft., so that they might be able to reconsider the experiment. Finally the consuls and the four officers of the cupola chose Brunelleschi, Ghiberti (who had just finished his gates) and Battista d'Antonio, the head master-builder, to oversee and direct the work.

G. Ll. M.



AN ARCHITECTURAL CRAFTSMAN'S VISIT TO ITALY.*

BY PROF. CHAS. GOURLAY, B.SC., A.R.I.B.A.

BY architectural craftsmen we mean all those who devote their energies to the perfecting of building work either as regards beauty of form or stability. By all such at least one visit should be paid to the Continent, even though it be for a few days only. Such a visit enables us to realise our insular position better than any amount of reading, and, further, is a powerful incentive to reading and study.

Before visiting a building which is worthy of study, either at home or abroad, we read about it, and thereby form our ideas of its nature and characteristics. On actually viewing the building our thoughts run in most cases in one of three channels: (1) that of destructive criticism impelled by disappointment—in other words, dissatisfaction; (2) that of satisfaction—by which I mean that you find the building to be just what you were led by your reading to expect it would be like; (3) that of exaltation, because not only has the building all those characteristics which you expected it to possess, but, including its situation and surroundings, it so strikes you that you are quite delighted with it, and you feel that all the discomforts of travelling and other troubles incidental to circumstances were well worth surmounting for even a short time of such joy.

Then we come home and we *think* about the building we have seen. For the true craftsman cannot forget a building which by study on the spot he has made his own. We then begin to realise that, whether we were disappointed or satisfied or exalted when we studied the building on the spot, we have received from our actual contact with it an inspiration which is part of ourselves, and which acts continually on our minds, impelling us onward in the work of our lives.

The architecture of Northern and Central Italy, which I visited last year, seems to me to be readily divided into three main groups, named after the former capitals of the provinces. If we begin at the north, we have first Venice with the architecture known as Venetian; then Florence with what is called Florentine architecture; and then Rome, with Roman architecture, which statement however applies to both ancient and modern work. Let us begin with Venetian, which, besides being the most northern, is the style from which I think the younger student can learn most that will be of value to him in his everyday work in this country. One reason for this is that Venice is, like Great Britain, protected by her position, being that of a group of islands. When Venice was attacked in the former days, the fighting was done on the sea, and when the buildings of which you are now to see views were erected Venice was "Mistress of the Sea," and so her inhabitants could and did build "homes" not "castles." Therefore we find in her architecture large open windows and doorways, balconies, &c.—no buildings exhibiting a fortified appearance.

In this lecture the first slide was a bird's-eye view of Venice to show the relative position of the various parts and buildings of Venice. Then Byzantine architecture in Venice and Ravenna illustrated by views of S. Mark's, Venice, and S. Appolinare in Classe and S. Appolinare Nuovo, Ravenna. Gothic architecture in Venice and North Italy was shown by views of the Doges' Palace and the Ca d'Oro, Venice, also by S. Zeno, Verona, S. Ambrogio and the Cathedral, Milan; Renaissance architecture in Venice and North Italy by views of the churches of S. Michele, S. Giorgio Maggiore, the Redentore, and S. M. Salute, Venice, and S. M. Grazie, Milan; and the civil architecture by views of the interior courtyard of the Doges' Palace, the Palaces of Grimani-San-Polo, Vendramin-Calergi, Grimani and the Rezzonico-Browning, Venice, and by the Palaces del Consiglio and Bevilacqua, Verona, and the Palace Municipio Vicenza.

The Romanesque in Tuscany was shown by views of the Pisa Cathedral, Baptistery and Leaning Tower, also by the Baptistery Pulpit, Pisa, and that in the church of S. Andrea, Pistoia. The Gothic in Tuscany was shown by views of Siena and Florence Cathedrals. The Renaissance in Tuscany by the Renaissance stalls and Piccolomini Tomb in Siena Cathedral, by the external pulpit of Prato Cathedral, the exterior of the Baptistery, Florence, the interior of S. Spirito and the cloisters of S. Lorenzo, Florence; then the courtyard of the Palace Vecchia and the Uffizi, Florence, the Palace del Governo, Siena, and the Palace Uguccioni, Florence, the Loggia dei Lanzi, Florence, and the Hospital del Ceppo, Pistoia.

Ancient architecture in Rome was illustrated by views of the exterior and interior of the Pantheon, the theatre of Marcellus, the Colosseum, and the triumphal arches of Titus, Septimius Severus and Constantine. Early Christian architecture in Rome by San Lorenzo without-the-walls, the arch of triumph in St. Paul's without-the-walls, and the cloisters of St. John Lateran. Renaissance architecture in Rome by views of St. Peter's, the Sistine Chapel in the Vatican, the west end, east and interior of S. M. Maggiore, S. Pietro in Montorio, the courtyard of the Vatican and the Cancellaria Palace, the façade and courtyard of the Farnese Palace, the courtyard of the Borghese Palace, and lastly, the Trevi Fountain.

---

* Summary of a lecture delivered before the Architectural Craftsmen's Society of the Glasgow and West of Scotland Technical College on January 11th, 1901.

BUILDING CONTRACTS FROM A BUILDER'S POINT OF VIEW.*

BY FRANK N. COWLIN.

IN the olden days it was, as you know, the custom for the architect to personally superintend the erection of his own work, and so to-day, if perfect work is to be produced, it is essential for the architect and builder to be in sympathy with one another, in order that the true spirit of the design may be carried out. To ensure absolute perfection in workmanship, only approximate prices should be given and the work executed upon a percentage on cost basis, or at day-work prices; either of these courses, from a builder's standpoint, may be considered ideal, though, as such, would not commend themselves to the ordinary commercial proprietor, who has generally far more consideration for his pocket than for architectural effect. There can however, I think, be no doubt that in the majority of cases bad workmanship is the result of low prices and strained relations between architect and builder; and when this fact is fully realised, and architects make up their minds to minimise competition to fair and reasonable proportions, and also to make the conditions under which the builder has to work as easy and comfortable as possible, then I think they will find very little cause to complain either as to the quality of the workmanship or the manner in which it is executed. To a builder the two most important factors in connection with building contracts are the conditions or form of contract and the bill of quantities. If the former is fair and reasonable and the latter correct and explicit, he may (should he know his business), with ordinary luck, rely upon getting through his work without losing any money, and if the conditions under which the contract is taken happen to be favourable and the competition not too keen he may make a profit. Losses on contracts, outside those occasioned by sheer misfortune, can, in nearly all instances, be traced to certain causes, and in the majority of cases these are (1) misconception of the conditions of contract, whereby you contract to carry out considerably more than you bargained for, or (2) inexplicitness on the part of the quantity surveyor. Speaking in this connection, cases have come to my own knowledge where surveyors have been instructed to make their quantities as inexplicit as possible, with a view to deceiving the competitors, and so keeping down the amount of the tender. I am pleased however to say that in the instances referred to the surveyors did not follow their instructions.

With regard to the form of contract, for my own part I much prefer a sheet of notepaper saying that I am prepared to do certain work for a certain sum to an architect's satisfaction, and specifying the terms of payment. It is obvious, however, that in a large number of cases, and with most persons, this course would be unwise, and that a properly drawn form of contract is preferable, setting forth in precise terms what is agreed upon. Originally these contracts were drawn on behalf of the building owner by his solicitor, who was paid, I presume, so much per folio; the innocent builder of the days of our youth, confiding as a child, would not employ a solicitor to look after his interests, and, being anxious to secure the work, would sign anything he was asked. As a consequence we have handed down to us forms of contract which I think I am safe in saying many of us have signed without reading, and even if read, not understood, contracts to which if we had been legally held would have resulted in our seeking fresh fields and pastures new. But in recent years things have changed, and although we are continually being asked to sign many different forms of contract there is rarely little trouble in getting architects to see that there are two sides to every question, and that the builder is every bit as much in need of protection as the building owner. It is extremely rare for any contract now to be put before a builder which does not contain an arbitration clause, and yet fifteen or twenty years ago any man that asked for such a thing was regarded as a dangerous individual. It is strange that builders should have for such a long time existed without such a clause, and this may well be regarded as an example of their easy and tractable nature. All other contracts between business men invariably contain it, and to my mind, in the building trade, with its many complications, it is all the more necessary, as much from the employer's point of view as the builder's. The general impression seems to have been that unless the builder was entirely in the power of the architect disputes would be constantly arising. Time however has proved differently, and as the insertion of the clause protects builders from unprincipled architects or so-called architects it has also the effect of causing employers and architects to exercise more care in the conduct of their works.

Different Forms of Contract.

There are many different forms of contract, but those in most general use are that agreed upon by the Royal Institute of British Architects and the National Association of Master Builders, and that issued by the R.I.B.A. Both of these are a most distinct improvement on those in use before they were issued, and are very similar to one another. The former has since been objected to by the R.I.B.A., and has resulted in the issue by them of the latter. The difficulty arose over, I believe, the arbitration clause. In the original contract, in the event of any dispute arising, either party might immediately proceed to arbitration whilst the works were in progress. This was objected to, and in the form issued by the R.I.B.A. the following clause is inserted: "Such reference, except on the question of certificate, shall not be opened until after the completion or alleged completion of the works, unless with the written consent of the employer or architect and the contractor." From my point of view the clause in the original contract is much preferable; to a builder upon a large contract, dealing with men with whom he is practically unacquainted, it appears to me to be most vital. In the event of a dispute occurring in connection with extra depths or other works to foundations, involving the expenditure by the builder of some thousands of pounds, if he is unable to get the matter settled as he proceeds, he may have it hanging over his head for three or four years until all the circumstances are forgotten, during which time he is also being kept out of his money. On the other hand, the argument may be raised that a contentious builder might start arbitrating at the commencement of a contract and go on arbitrating until the finish. This is a case which I do not think would ever occur, and in this my opinion is confirmed by my experience of the working of the arbitration clause. With this exception I would be prepared to agree to either form, both of which can only have been compiled after much careful thought and expenditure of time.

---

* A paper read before the Bristol Society of Architects on January 14th, 1901.

Much difficulty is, as a rule, experienced in dealing with urban and municipal councils in connection with forms of contract, as they often require conditions much more drastic and arbitrary than any other body. They are however gradually learning wisdom, and when they find, as they often do, that respectable firms will not agree to these conditions they are prepared to modify them. Doubtless the course they adopt is taken in self-defence, and if such a course is necessary, and is founded on experience, they have my sincerest sympathy. The forms of contract issued by the War Department, Admiralty and Board of Works are also fair and reasonable, and in many cases their terms of payment are more favourable. Many architects adopt forms of their own. Of these experience has taught me to be careful, and always, if possible to avoid signing. With two such forms as those already referred to, there is no necessity to go any further.

Speaking of forms of contract generally, the principal points the builder has to consider are (1) time clause, (2) terms of payment, (3) inability of proprietor to pay, (4) liability for acts of other persons or things, (5) maintenance clause, and (6) arbitration clause. As to

The Time Clause.

In the majority of cases this is more honoured in the breach than the observance, and for the reason that the time is named without thought, and in most instances is altogether inadequate. Considerable dissatisfaction is caused to the proprietor, who cannot understand reasons for delay, and is therefore most anxious to obtain from the contractor damages to which he is not entitled. It is most decidedly to a contractor's interest to get his work done as quickly as possible, and for the benefit of all concerned a reasonable time should be appointed in which the work can fairly be executed; to this both the contractor and the architect should be held, delays in many instances arising as much from dilatoriness on the part of the architect as on the part of the contractor. In reference to the

Terms of Payment.

From time immemorial it has been usual to pay 80 per cent. on the value of the work executed and fixed in its place. Since this arrangement was instituted the times have considerably altered, and it is impossible for a builder now to obtain the same terms from merchants and manufacturers which he got eight or ten years ago. Then it was usual to be allowed four or six months' credit on most goods, and on timber six months, whilst in several cases twelve months' accounts were allowed. Now all timber, iron, stone, bricks, cement, and, in fact, by far the largest portion of the materials used in a building, have to be paid for in a month following delivery, whilst in a few favoured cases a three months' account is allowed. This, you see, means practically a cash business, so that it is impossible to carry on anything like a large establishment on the old conditions. According to the terms of all contracts, all materials delivered on the ground become the property of the proprietor, and therefore they should be taken into consideration when the certificate is granted, and payment should be made on account of them. This you may say is liable to abuse in the case of a shaky builder, but, by the exercise of some care and tact on the part of the clerk of works and architect in granting the certificate, I fail to see how any difficulty can arise, and in any case the proprietor is protected because he has the goods and also the margin of the reserve. With regard to the percentage to be paid, this should I think be increased to 90 per cent. If 80 per cent. was the standard twenty years ago, the manifest change in the conditions of trade since and the increase in competition and decrease in profits fully justify one in asking for the 90 per cent. Wages have to be paid weekly and form, roughly speaking, 50 per cent. of a builder's turnover, and this, with the shortened terms of credit makes it most difficult to finance a builder's business; so much so, that no matter how profitable a business you may be transacting you find it impossible to get on without borrowing from your bankers, for which luxury you have to pay pretty dearly.

As to the amount of the reserve. This, of course, varies with the amount of the contract, but for contracts up to £10,000, 10 per cent. is I think now a generally accepted amount. Beyond that sum it is a matter of arrangement. Personally, I fail to see the necessity for a large reserve or the need of retaining it for any length of time. Much of course depends upon the character of the builder, but in ordinary cases I think it is fair

PALAZZO GRIMANI S. POLO, VENICE. ERECTED BY ONE OF THE LOMBARDI, SHOWING THE SIMPLICITY OF THE EARLY RENAISSANCE.

S. MICHELE, VENICE. MORO LOMBARDO, ARCHITECT. DATE 1466. AT THE ANGLE, THE CAPPELLA EMILIANA, BY BERGAMASCO. DATE 1530.

to pay half the reserve at the completion and the remainder at the settlement of the accounts, retaining some nominal sum for a further period of three months, sufficient to make good any defects that might occur during that time. Such an arrangement as this would be an incentive to builders to get their accounts settled quickly, and much inconvenience and trouble to architects would be saved.

Inability of Proprietor to Pay.

The next clause of importance is one which should make the proprietor liable to pay within a reasonable time after the deposit of the certificate. This is a point which is a very sore one with builders. They are expected to perform their part of the contract, but it is not at all unusual to find that after having obtained (maybe after considerable trouble) a certificate for a payment on account it takes a further four or five weeks to obtain payment. A clause to protect builders in such cases should be introduced in all contracts, as I am glad to say it is in the forms issued by the Builders' Association and the R.I.B.A. Much trouble and annoyance would be saved also if a clause were inserted by which payments would be made at stated intervals, no matter how small or great; then the proprietor would be prepared to meet the certificates as they were presented.

The Contractor's Liabilities.

The next clause I wish to touch upon is one making the contractor liable for any loss or damage whatsoever to the premises from whatever cause arising and until the expiration of the term of maintenance; it is often introduced into contracts other than those I have mentioned. The contractor's liability should cease as far as loss or damage is concerned when the buildings are completed and handed over.

The maintenance clause I have already touched upon. It is one in which a great deal is left to an architect to decide, and when he happens to be weak and the proprietor is strong the position of the builder becomes uncomfortable.

There are two clauses in the contract of Messrs. —— which are I think worthy of consideration. The first is the reference clause, which is as follows:—"The architects shall during the progress of the works have the powers above described, and shall be the sole judges in all matters relating thereto as to the interpretation of the drawings and specification, as to the execution, condition and extent of the work from time to time actually executed, as to the quality of the materials used or to be used in and about the several works, and as to the degree of despatch with which the works should be conducted and carried on and in all matters of account connected therewith, and as to any question which may arise as to the progress and conduct of the works or deviation from the specification and drawings, and in respect thereof their decision shall be final. But in case after the building shall be completed any dispute or difference shall arise between the employer or the architects on his behalf and the contractor in respect of the contract or of anything connected therewith or relating thereto or to any additional works or variations thereon, or as to what addition (if any) ought in fairness to be made to the amount payable to the contractor by reason of the works having been delayed through no default of the contractor or by reason or on account of any directions or requisitions of the architects involving increased cost to the contractor beyond the cost properly attending the works according to the true intent and meaning of the signed drawings and specification, or as to the construction of these presents, such difference shall be referred to the arbitration of ——."

The point I particularly wish to refer to is that portion which says, "or as to what addition (if any) ought in fairness to be made to the amount payable to the contractor by reason of the works having been delayed through no default of the contractor or by reason or on account of any directions or requisitions of the architects involving increased cost to the contractor beyond the cost properly attending the works executed according to the true intent of the signed drawings and specification." Contractors are continually being put to considerable expense by the causes enumerated above, and although it must be patent to both architect and clerk of works that they are fairly entitled to it, I have only once in my own experience heard of an architect granting such a sum, except under pressure. It should be distinctly understood in such cases that a builder is to be paid what is fair and reasonable, and this should be left to the architect, or failing him, to arbitration. The second clause is as follows:—"Notwithstanding anything hereinbefore contained, the contractor shall not be responsible for the act, default or omission of any other contractor employed by the employer in or about the execution of any of the works comprised on the specification or in or about the execution of any other works upon the site." It speaks for itself, and I, speaking from very bitter experience, can testify to its importance.

This, gentlemen, in brief is all I have to say as to the conditions of contract, and I now come to what is just as important from a builder's point of view, and that is the question of

Quantities.

In this connection it is very pleasing to note that during the last few years there has been a most distinct improvement in the quality of the quantities supplied, and that the custom of allowing the surveyor to measure up for and settle all accounts is becoming more general. The advantages of this, from both sides of view, must I think be obvious, and whilst perhaps it may be more advantageous to a certain class of builder to settle accounts with an architect who is not so well up in prices and variations as a fully-qualified surveyor, it is to the benefit of the trade generally to leave the accounts in the hands of the latter; any profits made have then to be made on the basis of the prices quoted, and not on the basis of one's powers as a debater, to put it as mildly as possible.

A most important point in connection with bills of quantities, and one upon which in this district there are many diversities of opinion, is the question as to whether they shall be the basis of the contract or not. Many builders I have spoken to upon the subject prefer that they should not, and that the custom generally prevailing here of checking the quantities and then taking them as correct is preferable. Personally I cannot agree with them. It is not part of a builder's business to check quantities, and in a large contract it means a very great cost. In my opinion it is not fair that a man should be paid for work he does not do, and in this system this most invariably occurs.

It is usual for a builder in checking quantities to discover only items that are short or entirely omitted and to get these allowed, whilst nothing is said about items that are full, and if a builder is of a particularly suave and persuasive nature he is enabled to get more allowed to him than he is fairly entitled to. A surveyor, if he knows his business, should be able, and is able, to take off quantities that are correct, and upon these the contract should be based. This is the system that obtains generally in London and the north of England, and it is found to work satisfactorily. In many instances, notably in Government work, the quantities are guaranteed. This is practically the same thing as making them the basis of the contract, and it speaks volumes for the character of their work that surveyors are prepared to do this even when the contract amounts run into several hundred of thousands of pounds.

The main results of this system are, (1) a vast improvement in the quality of the quantities, a surveyor's reputation entirely depending upon their exactitude, whilst under the old system any mistakes might easily be covered up; (2) it has shown builders that a complete knowledge of the cost of their work is absolutely necessary, and this must tend to improve prices and the status of the trade generally. If a builder is only paid for exactly the amount of work carried out, it follows that his prices must be correct if he is to make a profit. He cannot assume, as one does at present, that the quantities will be full with one man and short with another. It reduces the speculative character of the business and enables a firm to more fully trade upon their merits. It is the custom in Scotland to remeasure the work on completion, and to pay at the original schedule rates. This, assuming the original schedule to be correct, is practically the same as making the quantities the basis of the contract, and this system is found to work satisfactorily, and is the outcome of previous experience. The only argument as far as I can see that can be used against it is, that possibly in the event of the quantities being incorrect the building owner cannot tell exactly what he will have to pay for his work when he starts. This argument speaks little for the ability of the surveyors, and the contingency named is, I think, one which would very rarely occur.

The next question I would like to deal with refers to

Prime Cost Sums and Provisional Amounts.

Different surveyors have different ways of considering the term p.c. It is usual to mention that it means nett cost; and then the question naturally arises, what is nett cost? Does it mean nett cost to the contractor or nett cost to the ordinary consumer; and this opens up the question of trade discounts, and then the trouble begins. It would I think be well if trade discounts could be altogether abolished. In tendering you are told to add your profit, and this I usually make a point of doing. If there are a large number of p.c. amounts I usually lose the contract, which is obtained, perhaps, by a contractor of a more speculative nature, who does not add any profit at all, but who, in the settlement of accounts, does not divulge the nett cost of the articles in question, and perhaps by pre-arrangement with the merchants supplying the goods, or by argument, or to use a slang expression "bluff," is enabled to obtain the trade discount and in all probability obtains a larger percentage of profit than I should have added, and that at the cost of the proprietor.

Many firms, especially when they quote the architect direct, refuse to allow any discount, or if they do allow it, it is distinctly stated in their quotation, so that no misconception can arise.

It is fair to assume that a builder must make a profit on these amounts, and if it could be generally understood that all architects and surveyors would allow 10 or 15 per. cent., or any stated percentage, upon the actual nett cost to the builder of the goods in question, and that this sum would be added by the surveyor in preparing the quantities, much discussion, misconception and bad feeling would be avoided. We have lately tendered for a contract under Messrs. ——, and in their conditions in reference to the p.c. amounts they have the following clause:—"The whole of the provisional sums and prices throughout are understood to bear a 10 per cent. discount to the contractor, and he is, it is understood, entitled to no further profit on these provisional amounts." This to my mind is a very satisfactory way of dealing with the difficulty, and as they also have a condition that the receipts for the various goods are to be produced, if necessary, they are well protected against any unscrupulous contractor.

In a contract we are carrying out the question of p.c. sums is dealt with in the specification by special note as follows: "that wherever the word 'provide' or 'prime cost' is used the amounts thus mentioned are to be expended at the discretion of the architects, and the architects may require the amounts thus mentioned to be paid by the contractor nett to any tradesman selected by them on their certificate, or such amounts may be certified on the proprietor direct and deducted at the settlement of the accounts."

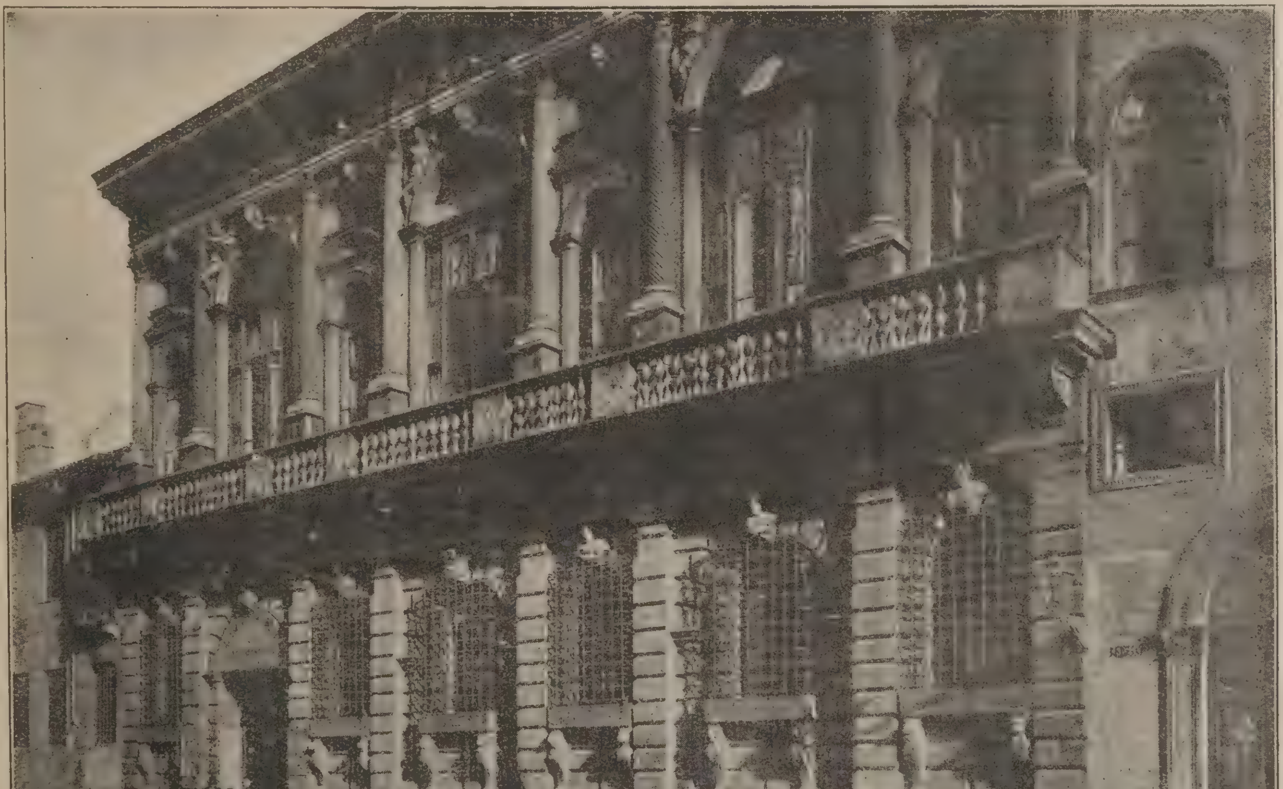
In the quantities there is a special bill for provisional sums and works in connection with them. As each sum is mentioned so the discount upon same, if any, is given. At the end of the bill a clause is inserted which summarises the amounts in the following terms:—"The total sum of the above provisional amounts is (say) £4,000, of which part will be expended at contract rates or deducted at the settlement of accounts, and part is subject to discounts as stated, but as regards the sum of (say) £3 500, allow for all builder's profit and establishment charges, &c, &c." This, perhaps, in a large contract which contains a large number of provisional sums, is the best way of dealing with them. There can be no misconception, and if the contractor does not add his profit he does not get it.

A very general fault I find in quantities in this district is, that there are not enough provisional sums included. Oftentimes, more particularly in alteration works, one has to price items the cost of which it is impossible to accurately estimate until the work is being done. In all such cases a provisional sum should be inserted at the discretion of the surveyor, and the matter adjusted at schedule rates.

Again, with regard to spot items, the descriptions are often most inadequate. From a builder's standpoint, all items should be so described as to render it unnecessary for him to be continually referring to the drawings when preparing his estimate. It is not at all unusual to find the thickness of walls omitted in items for drawing openings for doors and windows, and the sizes of the same are also left to the imagination of the builder. On enquiry you are of course referred to the drawings.

The preparation of estimates is a most serious matter in a builder's business. Unless he is in a very large way he has to do most of the pricing himself, and when one considers the time this occupies and the number of estimates he has to send in for every one he is fortunate enough to get the necessity for the quantities to be as explanatory and explicit as possible is apparent. In quantities, as with everything else, it is the best that is the cheapest, and I am confident from my own experience that the interests of the proprietor, and also of the builder, are best safeguarded if a first-class surveyor prepares the quantities and adjusts the accounts. Much more might be written upon this interesting subject of quantities, but time does not permit.

Another important factor in considering building contracts is the clerk of works so important a factor that I am of opinion that he deserves a paper to himself. Too much consideration cannot be given by an architect in selecting his clerk of works. One man, if he is not thoroughly conversant with his work, both practically and theoretically, may make the work cost 5 or 10 per cent. more than another man, whilst both attain the same result. In many instances they have absolutely no conception as to the duties of their position, but imagine that all they have to do is to see that proper materials are used. My own idea is that the clerk of works should be



PALAZZO BEVILACQUA, VERONA. MICHELE SAMMICHELE, ARCHITECT. DATE, CIRCA 1527.

the architect's representative upon the works, and as such he should be prepared to obtain and give all information necessary to the proper carrying-out of the contract; he should be responsible, with the builder's foreman, for the proper setting-out of the various parts of the building, and should also in a measure be responsible for the time taken to complete the contract. It would be a very good thing if they could be engaged at so much per contract. I think architects would then find their works executed with much more promptitude and despatch. There are many excellent clerks of works I have had to do with, and I have to acknowledge many kindnesses at their hands, but I really do not think that architects generally appreciate the harm and annoyance which an incompetent or unprincipled man causes a contractor, who in the majority of cases is powerless to complain, for reasons which must be obvious.

In conclusion, there are three points in building contracts that I would strongly impress upon architects:—(1) The necessity of keeping up all approximate quotations: 90 per cent. of the troubles between architect and builder, and also the proprietor, arise from the fact that in the majority of cases the cost is considerably more than was expected. (2) To remember that it is essential for the good of the community that the builder makes a profit. If he is not allowed to do it fairly, he is, I fear in many cases, apt to do it unfairly. (3) Always be prepared to grant certificates if the money is due. The financial question is a most important one with builders, and whilst there is no difficulty in obtaining the first payment, one has often to write two or three times without getting a reply in one's efforts to get further certificates. Speaking as a contractor who has sufficient capital for the amount of business done, I can honestly state that more worry and anxiety is caused the builder over this question than by any other detail in his business.

GLASGOW ROYAL INFIRMARY.

Dr. Duncan's Objections.

AT the annual general meeting of qualified contributors to the funds of the Glasgow Royal Infirmary held last week, Dr. Ebenezer Duncan said that the present building was very antiquated according to the modern standard, and it could not by any extension on the part of the directors be made a modern hospital. He was of opinion that, in the first place, the site was not one which was by any means suitable for the treatment of a large part of the inmates. He asked the meeting to bear in mind what was the result of modern investigations in regard to tuberculosis, one of the main sources of disease treated in their hospitals. In the treatment of tuberculosis what was wanted was an absolutely pure atmosphere and abundance of fresh air. Recent investigations had shown that in the Glasgow hospitals, taking the surgical side of the hospitals, they had 25 per cent. of the patients suffering from various forms of tuberculosis in the various organs, and a surgeon told him that in his opinion general hospitals in Glasgow were not the places for the treatment of such cases; they ought to be in the fresh air of the country. He asked any man if the air of that neighbourhood where the Royal Infirmary was situated was a proper place to treat consumption of the lungs, or asthma, or bronchitis, or pneumonia? Not only that, but as far as he could judge from the plans, it was proposed to have this hospital ventilated by the "plenum" system. He had had twelve years' experience of the "plenum" system, and while he believed that it was a great improvement on many of the systems of ventilation, and that it would be of very great benefit in the new Royal Infirmary, as a matter of experience he had found it impossible to prevent the air getting from one ward into the corridors and into the whole hospital. In a hospital where there were 700 patients they would in those circumstances get a condition of matters which would not by any means be sanitary, and which would be a great danger to the patients when any kind of epidemic disease broke out. For that reason, apart altogether from reasons connected with the site, he held that it was a great blunder to go on with this institution. He called their attention to the fact that the Institute of Architects in Glasgow protested against the plans. He asked the contributors to put a stop to a scheme which he believed would not be in the interests of the sick poor of Glasgow, but very much against their interests. He recommended that a small committee should be appointed by the Court of Contributors to meet the directors and discuss the matter. He moved an amendment to delete the part of the report approving the reconstruction plans. Ten voted for the amendment and twenty-three for the adoption of the report as submitted.

Builders' Notes.

An Auction Sale, on February 13th, of builders' materials and goods will be held by Mr. Harold Carpmael in the grounds of "Surrey Mount," London Road, Forest Hill, in consequence of the completion of the new permanent building for Horniman's Museum.

Alderman William Gankroger, J.P., of Halifax, who died recently, had been on the directorate of the Charlestown Brick and Tile Company, Limited, for over 20 years, being chairman for a considerable part of that time, and he was also chairman for the first four years of the six-years'-old syndicate of the United Brick Companies.

Sale of Building Land at Wimbledon.—A portion of the Wimbledon House Estate (better known, perhaps, as the property of the late Sir Henry Peek) is to be publicly sold on February 16th, as advertised in one of our columns. The auctioneers are Messrs. Hampton and Sons, and the land included in the present sale is divided into about 35 lots of almost every variety of size and position suitable for purchasers wishing to spend from £250 to £2,500. Houses will doubtless be erected shortly along the Common front and in the newly-made thoroughfares of the estate. Since the opening of the sub-electric railway from Waterloo to the City the demand for houses at Wimbledon has far outrun the supply.

Partnerships Dissolved.—The partnership heretofore subsisting between Messrs. John Hughes and Edwin Ramm, carrying on business as painters and decorators at Westbourne Road, West Kirby, under the style or firm of "J. Hughes and Company," has been dissolved by mutual consent as and from January 23rd, 1901.—The partnership lately subsisting between Messrs. Samuel Pattinson and William Pattinson, carrying on business as builders' merchants and coal merchants at Sleaford, in the county of Lincoln, and elsewhere, under the style or firm of "Pattinson and Co.," has been dissolved by mutual consent as from December 22nd, 1900. All debts due to and owing by the said late firm will be received and paid by Mr. William Pattinson, who will continue to carry on the said business under the style or firm of Pattinson and Co.

The Report of the East End Dwellings Company for the past year states that good progress is being made with the new buildings in the first portion of the Victoria Park Square Estate. They have been named "Gretton Houses," and it is hoped that they will be ready for occupation early in the summer. These buildings will contain 352 rooms, arranged in tenements of one, two and three rooms. When the whole of the new buildings have been erected on this estate accommodation will be provided for nearly 2,000 persons. The total population of the company's buildings was 6,079 at the end of 1900. This population gives an average of 878 persons housed per acre on the land actually in possession of the company. If one-half of the public thoroughfares on which the buildings abut is brought into the calculation the average is reduced to 647 persons per acre. The births for the year were 177, being an average of 29 11 per 1,000 of the population, and the deaths (including those in hospital) were 85, being 13 98 per 1,000. Mendip and Shepton Houses were opened in July, 1900, and, with the exception of the larger and more expensive tenements, are rapidly filled up. On all the other properties the letting was most satisfactory throughout the year, and on December 31st only one tenement and five workshops were unlet. The collection of the rents at Ravenscroft (£3,389 14s.) has again been effected without incurring a single bad debt, and with no arrears at the end of the year.

London County Council.—At last week's meeting of the Council the Housing of the Working Classes Committee recommended that the architect be authorised to expend a sum of £60 on overtime for the preparation of the working drawings of the Mill Lane, Deptford, lodging-house. The committee also recommended that the estimate of £16,500 be approved for acquiring, under Part III. of the Housing of the Working Classes Act, the Caledonian Asylum and the site. The buildings to be erected will provide accommodation for about 1,400 persons in 10 one-room tenements, 196 two-room, 93 three-room, and 4 four-room tenements. The recommendations were adopted. The estimate of £1,315,000 (in substitution for the capital vote of £51,443 which was approved by the Council on November 6th last) in respect of the Thames Embankment extension and Westminster improvements at Millbank was approved; and as the Council of the City of Westminster has undertaken to make the necessary contribution of £100,000, the Improvements Committee were authorised to incur expenditure on capital account up to £1,315,000 for the purpose of the improvements in question. Mr. Mayhew asked if the attention of the Theatres Committee had been drawn to the recent overcrowding of several theatres, and to the obstruction of the gangways, and if, in case of fire, there was the slightest chance of the audience escaping with their lives. Sir Algernon West informed the Council that the committee had done their utmost to point out to managers the dangers of the practices referred to, and to enforce the regulations.

Fire Tests with Doors.—We have received publications Nos. 54 and 59 of the British Fire Prevention Committee, both dealing with doors. The first test was with a 2⅓in. oak door constructed in three thicknesses and a similar door of teak. The door openings were 7ft. by 3ft. The following is a summary of the effect:—In 17 minutes flame appeared at one of the top corners of the teak door; in 36 minutes the flame had extended across two-thirds of the top; in 57 minutes a glow appeared at the bottom of the door; in 60 minutes flame came through one corner of the oak door and a glow appeared at the bottom; in 67 minutes the boards at each side of the centre joint of this door bulged outwards 1½in. and the joint opened; in 75 minutes the opening in the centre widened and flames came through freely, extending across the whole width of the door at the top; in 75 minutes also the flames extended across the whole of the top of the teak door and through holes along the bottom. By this time two of the thicknesses of the oak door had disappeared, though the outer thickness remained in position; while the inner thickness of the teak door was gone, the centre thickness charred through (but in position), and the outer thickness burnt away for about 4in. at the top. The doors were constructed with the aid of wood pins and the boards were simply butt-jointed, not grooved or tongued. The second test was with a deal ledged door with 1in. boarding and a 2in. deal four-panel door moulded both sides. The door openings were 3ft. 3in. by 6ft. 9in. The following is a summary of the effect:—In 4 minutes flame appeared over the top of the deal ledged door; in 8 minutes the flame had extended all along the top; in 15 minutes flame appeared over the top rail of the four-panel door; in 16 minutes the flame came through the top panel; in 21 minutes the flame came through the lower panels; in 21 minutes also the upper half of the ledged door was fully alight; and in 25 minutes the test was closed, both doors being then practically destroyed.

Law Cases.

"Extraordinary Traffic": a Successful Claim. At the Bakewell County Court recently the Bakewell Rural District Council sued Messrs. Roper and Roper, builders, for damages in respect of extraordinary traffic on a road known as the Sir William Road, situated in the parish of Eyam Woodlands. The amount of the claim was £48 16s. 5d. Mr. Cockerton (for the plaintiffs) said the damage was done to the road by the defendants' traction engine with two trucks conveying stone from a quarry which adjoined Sir William Road. The road was very much cut up, there being ruts in it to the depth of 18in., caused by the wheels and the heavy traffic. In October the road became so bad that defendants had to discontinue leading stone by the traction engine. It was an ordinary country road suitable for the traffic of the district, and in an ordinary way would have little traffic upon it. Defendants' counsel contended that the road was an old country road, and was previously in a bad state of repair, which lent itself to further damage, and this damage would not have occurred had the road been in a proper condition of repair. The Judge said he believed that the traffic caused by the traction engine was extraordinary and excessive in weight. With reference to the question of damages, it was shown that the average cost in past years had been something like £5 or £6 per mile, taking all the roads in the parish. During the first six months of 1900 £3 16s. had been spent on the road, whereas during the last six months £58 13s. had been spent on only a portion of it. Even doubling or trebling the cost during the first six months, there still remained as much as the plaintiffs claim, and he thought therefore that the amount claimed was by no means excessive. After some further remarks his Honour gave judgment for the plaintiffs, £18 16s. 5d.

Damage to Buildings by Railway Vibration.—Mr. J. W. Penfold, F.S.I., sat at the Surveyors' Institution last week as arbitrator in respect to a claim against the Central London Railway Company for injury done to No. 2 Lancaster Gate, W. The claimants were Lord Herschell and Mr. A. W. M. Baillie, acting as executors under the will of the late Mrs. Mary Cunliffe. Mr. C. A. Cripps, K.C., who appeared for the claimants, said that in consequence, it was believed, of the construction of the Central London Railway serious cracks began to appear at 2 Lancaster Gate, and there were indications that a serious sudsidence was taking place. Owing to these disturbances the tenant, Mrs. Hawkins, left, and the house now remained unoccupied. The owners claimed damages to the amount of £1,600. Mr. E. R. Robson, F.R.I.B.A., said he had inspected the house on May 17th, 1899, and found a number of cracks in the walls and ceilings. They seemed to him to be caused by a general disturbance of the foundations, due, he should think, to the construction of the railway. Mr. J. Bott, house-agent, described the damage as seen by him on several recent visits. The first house, No. 1, which was nearer the line of the railway, showed even greater damage, and steel girders had had to be introduced into the hall. The cracks he imagined to have been caused by the construction of the railway, and now that the trains were working the damaged houses were less able to stand the vibration. Mr. Mark Judge, A.R.I.B.A., stated that he had inspected the house in June last year, and was of opinion that the damage was caused by the railway. Mr. Freeman, for the defence, said this was the first practical claim for damage brought against the company, and they were prepared to submit a large body of evidence to back up the defence. It was impossible from an engineering point of view that the damage could have been caused by the construction of the railway, which was 64ft. below the surface of the road. The house, which was 40 years old, had been built on the remains of a water-brook, and there still remained a large deposit of mud, with an unstable substratum. Moreover, the bursting of a water-main in 1897 had undermined the foundations, and it was quite possible that this was the cause of the damage. The hearing was adjourned provisionally until February 8th.

Carrying Out Drainage Work Without Authority.—At the Clerkenwell County Court recently William Thomas Ballard, a builder, claimed from W. Parker the sum of £22 19s. 9d., work and labour done and goods supplied. The defendant had filed an affidavit in which he denied being indebted to the plaintiff in the sum of £46 6s. 9d., alleged to be due for certain drainage and other work done at Nos. 1 and 2 Albert Villas, Archway Road, of which premises he was the owner. He did not authorise the work at the premises, as no drainage work was required there, and any work of that kind which might have been done was done on the plaintiff's own responsibility. Counsel for the plaintiff explained that the defendant was served last August with a notice by the sanitary authority requiring certain work to be done. The plaintiff was instructed to carry out the necessary work and did everything that was necessary. Defendant said that, up to the time he returned home on August 27th, he had heard no complaint about the drains to house No. 1. The drains had been set in concrete, cemented, and everything done to make them sound and secure about six years before. On his return he went to house No. 2, and was astonished to find that the main drain was up, as he had no intimation of what had taken place. Plaintiff took him to No. 1 and said the drains were all affected, but that witness denied, as he had them set in concrete, with new closets and the drains properly trapped by eminent sanitary engineers. Whatever had been done there by the plaintiff was without witness's knowledge or consent, and he told him he was astonished he had turned the drains up. The Judge said the case illustrated that if a person received an order to do specific work he ought to have it in writing, or supported by the strongest and cleverest evidence, or landlords and occupiers of houses would incur very heavy expenses. He was glad in this case that the representative of the sanitary authority had not been a party to anything of the kind, and had not lent himself in any degree to it, but had communicated what was said by the plaintiff in his presence. He could not help saying that the evidence given by the plaintiff was discreditable to him as a tradesman. He told them in the most precise manner that in the presence of that gentleman (the inspector) and another gentleman that the drains of house No 1 were exposed, and that they condemned them because the water test having been applied it was found they were defective. They found that the officer of the authority had never tested the drains nor expressed an opinion that they required to be re-laid. He gave a verdict for the defendant, with costs.

Water-Closets for Cottages.—At Newton Abbot last week Henry Hamlyn, of Chudleigh Knighton, was charged with two breaches of the building by-laws. The first charge was that he varied the plans of cottages after they had been approved by the Council; and the other was that he permitted the houses to be occupied without first obtaining the usual occupation certificate. Mr. Horner (for the Council) stated that early last year a Mr. Segar submitted plans for the erection of four cottages at Chudleigh Knighton. These plans were approved on March 21st. They provided for the construction of earth-closets, but the plans were not adhered to, and water-closets were constructed. Owing to this the Council declined to grant the occupation certificate, but the houses had been occupied. There was no water nearer than 54ft. for flushing purposes, and separate flushing cisterns had not been provided. H. B. Mapleton, medical officer of health, stated that for flushing purposes there should be five gallons of water for each person per day. The closets were hand-flushed. All hand-flushed closets were suspicious, and probably dangerous. For these houses, under all the circumstances, water-closets were eminently unsuitable.—Cross-examined: He did not know that water-closets were enforced in another part of the same village. He had never known a case of disease from a properly constructed earth-closet. He thought hand-flushed closets a greater evil than earth-closets. "If we disconnect with the sewer, take out the pan, and put in a bucket, you think that will be a sanitary improvement?" "Certainly." Defendant's solicitor said he was not there to find fault with the district councillors, who were guided by the judgment of their officials. But he complained that defendant had never had any notice that there was any fault to be found with the water-supply of the house. If a better water-supply was necessary the time to order it was when the plans were before the Council for approval. But then nothing was said about it. As to the variation of plans, defendant had acted for the best. If he had wanted to save his own pocket, all he had to do was to put in the earth-closets as shown in the plans, but he wished to make the houses as healthy as possible and so went to the expense of providing trapped cottage water-closets. Mr. S. Segar, architect, thought the alterations in the plans a great improvement. While he was sanitary inspector, old earth-closets were abolished at the chapelry in the same village, and hand-flushed closets were provided for four houses at Bickington several years ago. He did not call the closets in dispute water-closets. They were hand-flushed water-closets. Mr. Horner: What is the difference? Witness: Hand-flushed closets are better as the flush is greater. The Bench convicted in both cases, fining defendant £1 and costs in each, and also imposing a penalty of 1s. a day until the by-laws were complied with.

Correspondence.

Cockington Church, Devon.

To the Editor of The Builders' Journal.

Fair Park, Exeter.

Sir,—Referring to Mr. Josias C. Beare's admirable sketches of Cockington Church, published in your issue for last week, and his accompanying description, the latter, as referring to this church, is unwittingly a little misleading in one particular.

I remember, a great many years ago—certainly twenty-five—seeing an apparent young architect, in genuine artistic tourist get-up, busily engaged in sketching a certain cresting in the choir of Exeter Cathedral. As I passed him I said quietly, "I should not draw that if I were you: there's much better here; that is hardly worth the trouble." "And pray what do *you* know about it?" was his retort, in a tone of professional contempt that could only have been attained by a four years' articleship to some architect with a prominent name. "Well," I replied modestly, "only that I carved it *myself* three years ago!"

Much the same may be said of the font cover in Cockington Church. Only the lower portions are actually old. There was nothing existing four years ago to show what the top was like, so, taking as my *motif* some of the few stationary font covers of about the same date to be seen in the eastern counties, I made the upper part, as is now shown in Mr. Beare's careful drawing.

A story went the round of some professional and other papers a while ago to the effect that the old oak used in Cockington Church was so hard that no ordinary carpenter's chisel or saw would touch it, and the only way to cut it at all was by using the local blacksmith's drill. Having been personally more or less connected with the church in question for fully thirty years, I of course knew the statement to be utterly without foundation. Meeting my old friend, the Rev. James Henning, the present genial vicar, soon afterwards, I asked him however he could have allowed such a ridiculous story to get about. Silently he winked one eye, and then replied apologetically: "Well, I only repeated what the workmen themselves told me!" Cockington Church is dedicated to the respective honour of SS. George and Mary: there is only one other in England of similar dedication.

At this period of national sorrow the following may be of interest. When the two royal brothers the Dukes of Clarence and York were studying on board the *Britannia* at Dartmouth, about nine miles distant, one day, out on a walking trip, they visited Cockington Church, and on leaving, boy-like, cut their names upon the stone jambs on the east side of the south-west porch. The then vicar was quite indignant, and had the lettering erased. I thought then, and still think, his judgment was as regrettable as it was rash.

In my copy of "Rough Notes" on the Deanery of Ipplepen (published in 1848) the following particulars relative to Cockington Church occur, and may be interesting:—"Chancel 15ft. 7.n. by 12ft.; poor screen, complete with parclose and doors; three-light east window; three-light south window containing figure in glass with sword, the monogram of the Virgin over it; mutilated piscina; decalogue supported by figures of Moses and Aaron; nave 42ft. long; five Perpendicular piers and arches; stove in the midst; carved oak pulpit with niches gilt. North aisle and transept 33ft. by 14ft. 6in.; south aisle 33ft. by 11ft. 5in.; five arches, capitals foliated. At east end a pew with fire-place. West tower of two stages with diagonal buttresses, embattled parapet and low pinnacles. West arch open to receive singers' gallery. The entrance is from the west by six steps of descent. Font of freestone, Perpendicular, with shields and arms, situated at the north-west end of nave: it has the remains of a brass inscription around the upper moulding, with the name of Carey, whose arms also occur."

It will be seen by this that no mention is made of any font cover. Indeed, when I first found the panels they were lying about the church, and no one apparently had any idea what had been their original use. Curiously they are not in oak but of deal. There is very little old work of the latter material existing in Devon.

But to continue the "Rough Notes":—"South-west porch converted into vestry; donation tables placed within, also an old chest. The south door is locally known as 'the confessional.' This very interesting little Perpendicular church is of somewhat early date; indeed, some of the features of the tower appear to be a century older. The position of the porch, too, in the West Country is an early feature. The site, in the midst of the manorial domain, is extremely beautiful."

I have only to add that Cockington, as Cockington, no longer exists. The borough boundary of the neighbouring fashionable watering-place has recently been extended, and Cockington to-day is simply a suburb of Torquay.

Yours truly,

HARRY HEMS.

Payment for Overtime.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The query answered on p. 478 of your issue for January 23rd raises a much-debated point, and one which provides the *raison d'être* for much diversity of opinion, if not a little dissatisfaction. Upon a broad basis it may generally be set down—in the absence of any specific agreement to the contrary—that a man who works by the hour is entitled to payment for overtime, whilst he who works "by the week" at a settled wage has no claim for extra payment for work done after the usual working hours.

This, on the face of it, may seem somewhat unreasonable; yet I do not think it will be found so upon investigation. The employment of the man who works by the hour is uncertain and erratic; he is engaged at a moment's notice; an hour's warning terminates his engagement. On the other hand, the man who works by the week has a certain continuity of employment, and being entitled to greater consideration in the matter and mode of its termination should be prepared to yield some consideration to his employer in return. Again, a weekly servant (and the term "weekly" may be taken to include those who receive their salary monthly) has the advantage of the "hour man" in that holidays—public or annual—entail no loss of salary, and no deduction is made for lost time by late arrival owing to railway disorganisation, or by reason of temporary absence through indisposition; and it is generally not a troublesome matter to get a few hours—or even an occasional day—"off." For these advantages to the employee the employer naturally expects that his convenience shall be studied in return, and although in some offices it is the custom (rare though) to pay for overtime, or, in some others, to grant an allowance of 6d. or 1s. per head as "tea money," in the majority of cases it is expected that, if the exigencies of work require it, such overtime as may be necessary in order to cope with sudden pressure of work, or emergencies of any description, shall be worked without any extra remuneration being forthcoming. It is, of course, very annoying to be kept late at the office unexpectedly, especially when such detention may mean the upsetting of some carefully-planned arrangement; but "what can't be cured must be endured," so one has to make the best of the disappointment.

The foregoing presupposes the necessity for only occasional overtime. When the necessity becomes chronic it indicates understaffing, and the disease being readily diagnosed the application of the remedy is easy. But if for any reason an increase of staff is inexpedient, an increased remuneration may reasonably be expected, and is generally recognised as a valid claim. Yet, it is very very doubtful if an assistant could *enforce* payment for overtime. In the absence of any specific agreement it is necessary, for legal purposes, to prove "custom"; and if asked what is the custom I should say most decidedly that it is *not* to pay for overtime. True, an assistant cannot be made to stay beyond the usual office hours, that is to say, there is no legal machinery to compel him to remain; but if such a refusal was met by an application of the closure, an action for damages for wrongful dismissal would have little chance of success.

Before leaving the subject, however, it must be freely admitted that the overtime question is a burning one in many offices where staying beyond hours is the general rule for at least half the evenings of the week. Such cases prove understaffing, or bad management, or a blend of both; and if a courteously worded request for extra payment is met with a blank refusal, the remedy is either a little trade unionism among the assistants, or a perusal of "situations vacant" and as speedy a change as possible. But there is such a thing as "getting out of the frying-pan into the fire."—Yours truly,

H. E.

Quarry Notes.

A Jail as Quarry.—For some time prisoners at the county jail at Doylestone, Pa., U.S.A., have been compelled to break stone, but now that the stone at the jail has given out the prisoners will be compelled to quarry a new supply. They are shackled and guarded while at work.

An American Quarry Incline.—The contracting firm of Drake and Stratton state that the incline they have just built for the Conemaugh Stone Company, near Johnston, U.S.A., is one of the most remarkable in the world. It is 1,475ft. in length, and the grade is 52ft. to the hundred, so that the plane is almost vertical. By means of this incline stone will be lowered from the high levels of the hills to the Pennsylvania railroad. Five cubic yards of stone in huge blocks can be lowered at a time.

Foundations at Amsterdam.—Amsterdam was originally a salt marsh, and in order to make a foundation for houses it was necessary to drive large piles of wood, or rather masts, through a layer of peat, which in some places is said to be 40 or 50ft. thick. The nature of the soil may differ somewhat in different parts. The following facts will show still better its character. In 1605 a well was dug in one of the hospitals of Amsterdam (Oude Mannen-en vrouwen Gasthuis) to the depth of 232 Dutch feet. After 7ft. of earth there were found 9ft. of peat, and then soft clay, sand, earth, clay rather hard, and earth, altogether making 51ft. of depth. Then came 10ft. of sand, in which stratum the piles of Amsterdam chiefly rest. At the depth of 70ft there was found 1 ft. of pieces of peat. Sand, through which they did not make their way, was found at the depth of 232ft.

Polished Granite.—The question of polishing carved work in granite is one on which there seems to be a considerable divergence of opinion. The French sculptors and archite seem to have but one opinion in the matt and that is, that if the ground of an archite tural detail or monument is finely dressed a left unpolished, the enrichment should treated in a like manner; but if the monume is polished at all, it should be entirely Many workers in granite consider that a co bination of plain and polished work is by the most effective from a decorative point view. A spray of foliage or other orname carved in relief, certainly, has its conto emphasised by a polished background, t darker surface throwing the carved enrichme into prominent relief. The light and shade delicate carving is almost killed if the work polished; but a feeling prevails in France tl although this is so it is better to have monument of one uniform tint than to hav combination of the polished and unpolish stone.

Durability of Slates.—Mr. Larivière ma a communication on the determination of t porosity and durability of slates when expos to the influences of weather to the Commissi of Testing Methods for Building Materia established at the French Ministry of Pub Works recently. It is difficult, he says, to d termine the porosity, because as a rule schi are but slightly porous, and because care mu be taken not to confound the water between t layers of cleavage with the water really co tained by the pores of which these layers a composed. As a rule we may say that t duration of a slate seems to depend upon t proportion of carbonate of lime and pyrite contains. Crystallised pyrite is less i jurious than that disseminated througho the substance, the existence of which often only revealed by the general d composition which finally takes place. Pr fessor Brunner, of Lausanne, recommends t following method, taken from Fresenius, easily and rapidly estimate the quality slates:—Take a sample of slate 7 by 3 cen metres and hang it by a cotton thread in glass vessel containing 100 cubic centimetr of water saturated with sulphurous acid in su a manner that the slate will not dip into t liquid, then shut the glass and keep it in ordinary temperature. Bad slate decompos in a few days or even hours, becomi exfoliated; if it remain compact, it will gr very friable and spongy. Good slate w preserve its primitive state for four to s weeks. A superior quality of slate has sign of decomposition after several month This rapid decomposition of bad slate is d to the presence of pyrite, carbonate of lim and magnesia. The pyrite is transformed in sulphuric acid, which decomposes the oth minerals. The carbonate of lime is tran formed under the influence of humid air a carbonic acid into soluble bicarbonate.

Masters and Men

The Building Trade Dispute at Coventry sti continues. The proposed reductions in wag are: for bricklayers and carpenters, from 8¾ to 8d. an hour; plumbers, from 9d. to 8½d painters, from 8d. to 7½d.; and labourers, fro 6d. to 5½d.

Stone Quarrymen's Strike.—The men em ployed at Shire Hill and Lees Hall Sto Quarries, Glossop, are on strike owing to refusal by the quarry master to grant an a vance of about 20 per cent. in wages to skille workmen and ½d. an hour to labourers.

Aberdeen Plasterers' Wages.—A speci meeting of the Aberdeen Branch of the Scottis National Operative Plasterers' Federal Unio last week considered the employers' notice of reduction of wages to the extent of 1d. pe hour, which comes into force on February 24t On a vote being taken, it was unanimousl agreed to adhere to the present rate of wages.

A Memorial to the Late Bishop of London proposed to be erected.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Time's glory is. . . .
To ruinate proud buildings with thy hours,
And smear with dust their glittering golden
towers.—SHAKESPEARE.

Our Plates. PARTICULARS of the Italian buildings illustrated will be found in the article on "An Architectural Craftsman's Visit to Italy," which is printed on p. 2 of this issue.—The Soane Medallion and £100 was not awarded this year by the Institute, but three competitors were awarded thirty guineas each for their designs. Mr. H. Munro Cautley, of Westerfield, Ipswich (whose design we reproduce), was one of the three.

Smoke. SIR WILLIAM RICHMOND has addressed a letter to the secretary of the London School Board on behalf of the Coal Smoke Abatement Society in which he remarks that many forms of grates and stoves are already on the market which are designed to materially reduce the evil of imperfect combustion, and he suggests that wherever occasion arises the Board should specify for some form of these apparatus to be used in its buildings. "Such an example set by so influential a body could not fail to have a most salutary effect, and be of the utmost assistance to the Society in its work." A similar suggestion has been made to her late Majesty's Government, and has been received by them with a promise to put it in operation without delay and whenever possible, and even to furnish facilities for trials in order to ascertain the best form of grate for the purpose. The committee therefore trust that the Board may be induced to take their suggestion into the same favourable consideration, and so materially help forward the work of checking a great and crying public evil.

English and German Monuments. BISHOP WILKINSON writes to the "Daily News" from St. Malo on the subject of national monuments, many of which will doubtless be erected when the war in South Africa is at last concluded. He suggests that we should not be content, as hitherto, "with inartistic square stones, and uninteresting obelisks bearing the names of the gallant men who have died fighting for their country. Let the national instinct be recognised by all means, even in death, but utilised and lifted up into a great national beacon, as in Germany, by the overshadowing of some such works of art and beauty as are sown so widely and wisely over the German Empire. For instance, the Germania National Monument which looks across the Rhine to the hills of Lorraine, and full upon the earlier battlefields of the Franco German war, delivers its message and lesson to every young German lad and boy who is, or hopes one day to be, a soldier. Upon the front of the basement stands a colossal bronze relief of German crowned heads and generals who fought the battles recorded thereon in 1870; the Emperor William on horseback being, of course, the central figure in the brillant group. Beneath are five stanzas, opening 'Es braust ein Ruf wie Donnerhall,' which no one can read without owning it to be a war-cry, the Donnerschlag, of a great people terribly in earnest. On the sides of the stone plinth are two very telling bronze groups, carrying life-sized figures. . . . The German mother giving her boy his sword, and buckling it round his waist, is not very easy to look at with clear eyes if there be any heart beneath them. It is the good, sound, loving home-life of these Germans that makes them such fine soldiers, such a great, united, strong people. . . . The memorial at Coblenz is alone worth a journey from England. The next in magnitude and power, perhaps, after the Germania. It stands at the confluence of the Rhine and Mosel. The Emperor on horseback. It is war-horse led by the Angel of Peace. The victorious Kaiser returning to Berlin inclines his head to Ehrenbreitstein, and seems to salute the fortress. . . . The position is unique, the work grand, costly, massive and charged with life and teaching beyond all power of description. I have been thus diffuse over these two superb monuments to show how much Germany makes of these things, and what enormous sums she freely lavishes to teach her sons what war means . . . That we are so miserably poor in such monuments—indeed, absolutely without them—is nothing less than a great national loss. What an opportunity now, above all other points in our national history, to create such, and so commemorate British and Colonial brothers falling side by side on the far South African veldt in a cause common to the Empire. The art, poetry, teaching of such monuments have a tremendous influence upon national life and character, and we cannot afford in these days, when we must of necessity become a military as well as a naval power, to undervalue or neglect such influence."

Another aspect. THE Bishop's remarks have not passed unnoticed. One correspondent points out that the monuments erected in Germany described by him are not "war" monuments, but monuments commemorating the birth of the Empire and the nation. "Many Germans regret that this, the grand poetic idea, has not been made dominant, and that the prominence has so often been given to the warlike aspect. We in England should be very sorry to see huge monuments erected in memory of wars fought in China, the Soudan, and in South Africa." Another correspondent, who writes under the *nom-de-plume* of "A Brother of Mankind," and says he is not a bishop, remarks: "Is there not pandemonium enough in South Africa at the present moment but that we must prostitute the sculptor's divine art to the 'creation' of such hideous satires on the Sermon on the Mount?"

The Land Registry Office. IN a recent issue we drew attention to the proposal to bring forward the new offices of the Land Registry in Lincoln's Inn Fields (60ft. high with two storeys in the roof) to such an extent that it would project into the forecourt 28ft. At last week's meeting of the Council of the City of Westminster the Improvement Committee reported that they had received replies from His Majesty's Office of Works and from the London County Council in reply to the Council's protest against the suggested encroachment. The former replied that there was no intention of building over the existing forecourts. The London County Council stated that after considerable negotiation the First Commissioner would be prepared to keep back the proposed building line so as to align with the portico in front of the Royal College of Surgeons, and to surrender the building site of the existing one-storey building and convert it into an uncovered forecourt. A recommendation was adopted accepting this proposal.

Clergy and Artists' Association. The annual meeting of this association was held last Thursday, the Rev. Canon Lonsdale Ragg presiding. Amongst those present were the Dowager Countess of Darnley, Mr. E. S. Prior, the Rev. J. Eymes and the Rev. J. Bloxam. Before the business was proceeded with a resolution was adopted expressing sorrow at the death of her Majesty the Queen, and expressing sympathy with and loyalty to King Edward VII The object of the association is to enable the clergy and others to approach artists more directly, to form a centre where examples of artists' work executed in churches and buildings may be seen, and information given generally concerning their work. A further object is to undertake through its members decorative work in churches, to restore individual character to art in churches, and to counteract the evils of delegated work and of commercial and mechanical production. To use the words of Mr. W. Holman Hunt, the association is opposed to the "vulgar stained glass, and stereotyped and feebly-executed Gothicisms in churches of decorative pretensions," which "scandalise the nature of our faith." Decorations in the nature of "dead symbolism" are objected to, and the desire generally is to create a healthier and a living interest in the art-work of the day in the churches. No commercial object enters into the conduct of the association. The report, which was read by Mr. Reginald Hallward, hon. secretary, recorded the withdrawal of some of the members during the year, and, while this was regretted, the association was now all the stronger by the fact that the members were undivided in their aim, and took a deeper interest in the work to be accomplished. The exhibition held in connection with the Church Congress at Newcastle compared favourably with those previously held. These art exhibitions would now be a permanent feature in future congresses. Twenty-six new members had joined during the year. The income of the association for the year was £104 12s., and its expenditure £106 14s., and there remained a deficit of £33 16s. In moving the adoption of the report the chairman said the association did not seek for popularity, but rather to exert a very real influence in the matter of art in our churches. The report having been adopted and the officers re-elected, Mr. W. Bainbridge Reynolds read a paper on "Metal Work in Church Art."

Remarkable Babylonian Discoveries. MR. W. ST. CHAD BOSCAWEN gives a description in the "Times" of one of the most remarkable Babylonian inscriptions ever discovered, which has been recovered by the French expedition working at Susa under M. de Morgan. During his expedition of exploration to Susa in 1897–98 M. de Morgan discovered in the citadel mound at Susa the remains of several successive settlements and at least two ancient cities upon the site. The lower settlements, with extensive deposits of flint tools, maces and sickles, belong to the prehistoric age, although the finely-worked and decorated pottery and brickwork indicate some considerable progress in civilisation. In the last of the cities, which was evidently the Anzanian-Elamite capital destroyed by the Assyrians in B.C. 640 by the campaign of Assur-banipal, the explorers found the remains of Elamite palaces and temples which had been burned and destroyed; but more important still was the record chamber, in which were many inscribed monuments, bricks, cones, etc. Among the most important was the fine stela of victory set up at Sipar, in Elam, by Naram-Sin, the son of Sorrgon I., B.C. 3750, which had been removed defaced, and reinscribed by the Elamite Conqueror Sutruk-Nakhunte in B.C. 1400. The discovery of bricks inscribed with his name prove his occupation of the city. Here, also, were found inscriptions of Khammurabi B.C. 2200, who also claims to have conquered Elam. The largest and most important monument discovered is a granite obelisk 1·40 mètres in height, covered with an inscription of no less than 76 columns of extremely archaic writing, of the type of the earliest monuments from Tello and Nippur, and amounting to nearly 2,000 lines or packets of writing. On the ground of the writing alone this inscription may be assigned to an age as remote as B.C. 4500, and an examination of the contents of this inscription proves this estimate to be accurate. The monument is really a terminus or boundary stone. In the body of the inscription mention is made of "Mesalim, the son of the King." This is the same person who, "as King of Kish," took part in the frontier demarcation with Eannadu, King of Sirpurra, recorded on a clay cone in the Louvre, whose reign is about B.C. 4500, and the presence of the name of Urkagina patesi of Sirpurra among the official names mentioned is another confirmation. The importance of the inscription however consists in the astonishing evidence it affords of the advanced stage of Chaldean civilisation even at the remote age of B.C. 4500.

ARCHITECTURAL ACOUSTICS,

SYMPHONY HALL, BOSTON, U.S.A.

THE new Symphony Hall which is to be the home of the Boston Symphony Orchestra, is, perhaps, the first building ever erected whose acoustic properties were not, during the planning and construction, very largely a matter of mere guess-work, says the "New York Sun." Long before the walls were up it was known with great accuracy what the acoustic qualities of the auditorium were to be, and the architects proceeded with their work in entire confidence that the acoustic principles to which they were adapting their plans were scientifically sure.

This certainty on a point so long considered almost hopelessly uncertain was due to the investigations of Wallace C. Sabine, assistant professor of physics at Harvard University, who has been engaged in studying the subject of architectural acoustics since 1895, when he was asked by the Harvard Corporation to remedy the acoustic defects of a college lecture-room. Preliminary study of the problems involved led to a complete examination of the whole subject, culminating in the notable work done on the new Symphony Hall.

It has been a popular impression for a long time that acoustics practically applied was nearly, if not quite, a hopeless problem. People have seen a hall which was acoustically good, copied, as they imagined, exactly, with a result which was a total failure, and, very naturally perhaps, they have come to believe that the whole subject was beyond control. Books on acoustics abound in inconsistencies. One writer says that the dimensions of a perfect music hall should be as 2 to 3 to 5; a second, as 1 to 1 to 2; and another, as 2 to 3 to 4. The whole matter, popularly and scientifically alike, has been in a state of confusion.

But as a matter of fact, the difficulty has been a lack of study and therefore of understanding of the various details that influence the acoustic properties of a public hall, and this lack the Harvard investigations have gone far to supply. It is now known that the acoustic quality of one hall will be exactly duplicated by that of another, if the second is built exactly like the first, only the model must be followed in every way—in material, proportion and arrangement. Nothing can be varied, not even the slightest detail, without varying the acoustics also.

Of course, it is almost impossible to make one hall a mere facsimile of another. New methods of construction or ventilation, a thousand details, in a word, will cause a greater or less variation. But it is now possible to calculate the effect of all these changes, and by making still other compensating changes to retain the special values of any auditorium that one may have chosen to take as a model for good hearing.

Symphony Hall is a case in point. The architects, McKim, Mead and White, of New York, at first prepared plans for a building along Classical lines, and Mr. McKim visited Europe for the purpose of consulting with scientific authorities in France and Germany. It was finally decided that a Greek theatre as a music hall would be too dangerous an experiment in acoustics; and it was first decided by the committee to follow the general proportions and arrangement of a well-known auditorium, the Gewandhaus, in Leipsic. But the seating capacity of this hall, only about 1,500, was too small, and the plan had to be abandoned. The new hall, with its two galleries, its stage recess, its sloping floor, and, above all, its increased seating capacity, is a copy of the old hall only in certain acoustical results, and not in the architectural means by which these results were attained. The Boston hall contains about 175,000 cubic feet more than the one in Germany; yet, owing to skilful calculation and careful balancing, the reverberation of the former, as expressed in the formulas prepared at Harvard, is 2·31, against 2·30 for Leipsic.

The investigations at Harvard have embraced practically every detail of architectural acoustics, and have been carried on with a minuteness and a patience astonishing to the layman. Not only have the more obvious problems been studied, but calculations have been made to establish the acoustic differences between a room containing a small audience and the same room when completely filled; and something has even been done toward establishing the effect of plants when placed in an auditorium. The three essentials of a good music hall are, of course, fairly obvious: the sound from the stage should be sufficiently loud; the component parts of a complex sound must keep the proper balance of intensity; and a succession of sounds must come out distinctly, without confusion among themselves or from without. The problems arising on all these points have been carefully worked out, although the results of this study have not yet, in all cases, been fully tabulated.

In the important matter of reverberation, however, a most interesting statement has been made, with particular reference, aside from the purely mathematical treatment of the subject, to the qualities which various objects have of absorbing sound. Sound is one form of energy, and can be changed into any other form. Usually it passes into heat. This process of decay, as it is called, is known as absorption; and sound is absorbed, more or less, by any substance with which it comes in contact.

Reverberation is sufficiently well understood. An echo is a special example of it, but the more general sort of reverberation is a confused mass of sounds, as it were, which, unlike an echo, is incapable of being analysed into its various parts. Reverberation has spoiled many a public hall, but on the other hand a certain amount of it is not only not too objectionable but actually desirable in a good music hall. In the ordinary theatre, where reverberation is reduced to the lowest practical limit, an orchestra like the Boston Symphony would sound muffled and dead, as compared with a performance in a hall like its present one, where the conductor, Mr. Gericke, demanded, in order to obtain the best results, that the architects should not eliminate the reverberation below a definite limit.

The use of various materials as absorbents of reverberation, therefore, and the calculation of the effect of each, is one of the most interesting problems of acoustics. The lecture-room in Cambridge (U.S.A.), where the present experiments were begun, was so exceedingly slow in absorbing sound that a word spoken in an ordinary tone of voice was audible five and a half seconds after it had been uttered. During this time even a very deliberate speaker would have uttered a dozen or more succeeding syllables. These successive enunciations were blended into a loud noise, through and above which it was necessary to distinguish the orderly progression of the speech. This could not be done across the room, and even near the platform the effort to listen for any length of time was wearisome. By bringing into this room about 1,500 cushions from the seats of Sanders' Theatre, in Memorial Hall, and arranging them so as to expose the largest possible surface, the length of reverberation was reduced to 1·14 seconds—or about a fifth of what it had been before. The cushions had absorbed the rest of the reverberation.

In calculating absorption an open window is taken as the unit, since it makes no difference whether sound escapes into the open air or is transformed to heat in some substance, and an equal area of any other material is compared with this unit as a standard. The absorption of glass, for example, is thus expressed by the fraction of 0·025, and of pine sheathing by 0·061. More curious are the figures of persons, or for an audience *en masse*. A woman absorbs more than a man for the reason that her dress offers a greater surface. For the same reason a person sitting in a scattered audience absorbs more than he would if he were one of a crowded audience. An audience is reckoned as a bounding surface, like a floor, in these calculations, and its area is measured in metres. Here is a table of comparative values:

Audience per metre	0·96
Audience per person	0·44
Isolated woman	0·54
Isolated man	0·43

To give still another example, a settee upholstered in hair and leather has a value of 1·10, while a plain settee of ash is only 0·039.

Without attempting to go into the other branches of this novel enquiry, it will be easy enough to see how the Harvard investigations have raised architectural acoustics to a position it never before held, and made it, as in the new Symphony Hall, a trustworthy science.

New Patents.

These patents are open to opposition until March 14th.

1900.—Glazed Bricks.—225. M. F. Solon, Rushton Road, Cobridge, Staffs. Finely-powdered marl is pressed in a die, removed, dusted over with finely-ground earthenware or stone clay, pressed again and fired. After firing it is dipped into a solution of glaze and fired again. It is claimed that glazed bricks can be produced in this manner at considerably reduced cost.

Air-Moistening Apparatus.—4,721. J. V. Musgrave, 33 Legram's Terrace, Listerhills, Bradford. This invention relates to an apparatus for moistening the air in workshops and factories. It consists of a combined air and water jet. The air jet is fed under considerable pressure, and opens close to the water jet at such an angle that the water is reduced to a fine spray, widely diffused by the force of the current.

Skylights.—16,166. E. Reiss, Kaiser-Wilhelmstrasse 35, Düsseldorf, Germany. Instead of opening at one end, the skylight consists of three hooded frames connected by levers, so that the whole can be lifted bodily. The frames are fixed one above the other, and the top one is glazed.

The following specifications were published on Saturday last, and are open to opposition until March 16th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—338, Czerny and Schlimp, kilns for firing ceramic ware. 569, Vaughan, manufacture of lock and latch cases. 791, Schürholz, production of artificial stones. 1,535, Edwards, machines for cutting glass. 1,659, Meather and Bolton, automatic arrangements for safeguarding the wells of lifts. 2,209, Hine, sash fastener. 2,585, Fitton, stone-sawing machinery. 2,855, Forbes, acetylene gas generators. 3,023, Fielding, jib cranes. 3,036, Springborn, precipitation of sewage. 3,537, Hoskin, apparatus for chimneys for prevention of smoke. 4,632, Willetts, hydraulic jacks. 4,857, Baker, granding or pulverising apparatus. 5,607, Green, apparatus for filtering and purifying water. 13,212, Van Kannel Revolving Door Company, Ltd. (*Van Kannel*), revolving doors. 13,673, Cummings, double sash windows. 14,553, Dymond (firm of *Samuel Zielenziger*), incandescent gas lamp. 15,880. Nienstædt, die stocks and wrenches. 16,798, Zappe, underground conduits for electric conductors. 17,908, Diggs, tool sharpeners. 20,105, Munk, device for cooling, purifying and moistening air. 20,245, Hessel and Sippel, beams, joists, &c. 20,770, Heimpel, air-cooling device. 20,947, Gustafsson, apparatus for generating acetylene gas. 21,596, Bollé (*Bruck*), roofs and tiles. 21,791, Blake, hydraulic rams. 22,177, Sutherland, wall and ceiling decorations in hollow relief. 22,302, Bell, floors. 22,303, Bell, manufacture of plates, sheets, or tiles for making partitions, walls, &c. 22,314, Meyer, adjustable support for use on a ladder. 22,497, Wattmann, drainage gulleys. 22,569, Boult (*Fuchs*), building slabs or blocks.

Northern Architectural Association and the Queen.—On January 25th the Council of the Northern Architectural Association agreed to send a resolution to Sir Arthur Bigge, K.C.B., C.M.G., conveying to his Majesty the King and the Royal Family the deep sympathy of the Association in their great sorrow, and at the same time to express their sincere loyalty to the Throne of these realms.

Current Periodicals.

The Antiquary for February presents nothing of special interest. Among the articles is one on "The Passing of Old London," by J. H. Slater.

The Sanitary Inspectors' Journal.—Some notes are given in the January issue on the proposal to establish a branch of the Association in South Africa.

Feilden's Magazine for January is a double number, recording the developments in engineering during the nineteenth century. It is a most interesting number.

The Architects' Magazine for January contains an article on "Earthquake Architecture: How they Build in Manila," and one (from "The Sphere") dealing with the Forum excavations; the illustrations which accompany the latter are not pleasing.

The Church Builder.—The January issue of this quarterly record of the work of the Incorporated Church Building Society contains some observations on the revised "Architectural Requirements and Suggestions" which are sent to all who make application for help towards building or altering churches.

Architectural Association Notes—The February issue contains "New Century Greetings" from the past presidents of the Association. Many of them are very good, and we hope to print some extracts in our next issue (space does not permit this now, the "Notes" having arrived when going to press). The February issue also gives portraits of some A. A. volunteers for South Africa.

The Genealogical Magazine.—In the February issue is an article on the heraldry of "Henry V." at the Lyceum Theatre. The writer cites some curious lapses of heraldry, but states that the play shows a distinct and decided advance in accuracy on any of its predecessors which have come within his notice. "The one bare fact that neither of the two heralds represented in this play either blows or carries a trumpet is portentous, and augurs, if we may so dare hope, that the hardy race of trumpet-blowing heralds will soon, like the white rhinoceros of South Africa, become altogether extinct in 'Stageland,' where they have so often been found."

The Quarry.—As a writer remarks in the January issue, one of the crying defects in our present system of stone selection lies in the difficulty often found by architects in making use of the accumulated experience of the past by a study of the buildings which surround us. "The Quarry" hopes to effect some good by publishing with the March number an illustrated supplement on "The Building Stones of London." In future numbers it is also proposed to devote more attention to slate quarrying. The February issue includes an article on "The Petrography of Building Stone."

The Journal of the Clerks of Works Association.—"Much of our Portland cement stucco-work has failed through insufficient wetting of the underlying brickwork; it was used as a cloak to the rubbish and refuse of the brickfield. Portland cement is essentially a hydraulic cement; it attains in water a hardness of 30deg. greater than in air. The use of hot water or of soda as expedients to accelerate the setting deteriorates the cement; overworking the cement kills it; the first set is always the best. Portland cement is now obtainable as slow setting or quick setting, so that the above-named expedients are uncalled for as a means of reducing labour, or rather loss of time. Terra-cotta that is 'dipped' does not resist the action of the atmosphere on its exposed surfaces. . . . 'Dipping' is the immersion of the dried terra-cotta blocks in liquid clay prior to placing the material in kiln, and has for its object the obtaining of good faces. Manufacturers who are in possession of really good clay would conduce to their own interest by the avoidance of this practice." (Extracts from an article in the January issue of this journal)

The Artist for January reproduces some of Mr. James Baird's modelled friezes. Mr. Baird has done good work in London and Edinburgh: he is a native of the latter city and has studios at Putney. The design for a ceiling shown lacks homogenity: the parts seem to be disjointed instead of forming one complete whole. The number under review also contains reproductions of Mr. A. Hugh Fisher's work and some good book-bindings by Otto Zahn. Botticelli finds a zealous expositor in Miss Edith Harwood.

The British Clayworker.—The "Lancet' recently discovered that mud in streets is more' healthy than dry dust, because "the ultimate fate of mud is the drain-pipe, whereas dust often finds its way to the wind-pipe." This, of course, raises the question of street pavings, and our contemporary, in the issue for January, is of opinion that "there is no better form of sanitary roadway than that paved with suitable bricks. These do not occasion such a noise when traffic goes over them as does granite, and the roadway is easily mended. When properly set, and washed in certain seasons, in the same way as our main thoroughfares are at night time, the brick roadway is infinitely better, more sanitary, and less obnoxious than either wood, granite or asphalt. The bricks must, of course, be non-porous." In the issue mentioned there is also a most interesting review of "A Century of Brickmaking." It is pointed out that brickmaking has always been considered an inferior industry, carried on by uneducated men, and the bricks made by the ancients were no better, and little worse, than those made fifty years ago. Other articles deal with chimney construction, brick drying, marl blasting, and the manufacture of architectural terra-cotta.

The R.I.B.A. Journal.—In the issue for January 12th Mr. Francis Bond reviews Mr. Hope's book on Rochester Cathedral, a building which does indeed swarm with anomalies and aberrations. Says Mr. Bond: "At the very outset, in its pre-Conquest work, it presents us with an insoluble problem. Peterborough has underground one Saxon church; what is Rochester doing with two? . . . One can come to no other conclusion than that, though Roman prelates found the money, English builders furnished the plan. . . It is probable, then, that we have at Rochester, and here only, the plan of an Anglo-Saxon church of the first rank." In the issue for January 26th Mr. Raffles Davison champions the perspective. Here are some of his remarks: "The objection to perspective drawings seem to me to be indicative of a growing feeling against ornamental drawing . . . I would not contend for any adventitious prettiness, but only for truth . . . The truth of the matter is, it is the elevation which is the dangerous and misleading item in the illustration of a design. Things which look well enough in elevation have a trick of turning up very queerly in perspective . . . The most lightly touched-in perspective, if accurate, is better as a realisation than any number of highly-finished elevations . . . I would point to Messrs. Leonard Stokes, Ernest George, Beresford Pite, Aston Webb, T. G. Jackson, H. J. Austin and Reginald Blomfield as men who can, and do, think in perspective, who can draw perspective as well as build perspective . . . For my own part I would urge the architectural student to think incessantly of the perspective result of his creation."

The Building, Engineering and Mining Journal (Sydney, N.S.W.)—The December issues are largely taken up with the competition for the proposed bridge to connect Sydney with the North Shore. As already announced in our columns, the premium of £1,000 was secured by Mr. E. Cruttwell, of London, but none of the designs were recommended for acceptance. Of Mr. Cruttwell's design our contemporary remarks that, "on account of the high price of the accompanying tender, it is practically useless, besides presenting certain novel features of construction which might possibly be attended with failure. . . . The Government intends to forward the plans to some of the most eminent bridge builders in England and the United States, and ask for a full report to be furnished as to the feasibility of carrying out one of the designs. If the report is satisfactory, the Premier proposes either to accept a tender subject to the approval of Parliament, or to get everything in readiness so that the work can be proceeded with as soon as Parliamentary sanction is obtained." Mr. Cruttwell's design shows a cantilever bridge, with a central span of 1,266ft. and side spans of 61ft. each. There are two pairs of main cantilevers, each having a shore arm of 618ft. and a harbour arm of 489ft., while the central span is 288ft. in length. The main trusses are of different strengths, owing to the arrangement of the cross section, whereby the whole of the deck is brought inside the main girders, and the railway tracks are placed adjacent to one of these, instead of being situated at the centre of the bridge. The piers and abutments are of masonry, and full approaches are included in the design.

Scientific American (Building Edition).—There is nothing to note in the January issue: the designs shown preserve their multiplicity of roofs and columns, mixed up unrestrainedly. Special space is devoted to "an Old-English half-timbered house at Greenwich, Conn." "Field stone, laid up in a rustic and rough manner," is used up to the first floor, then tiles (or bricks) to the level of the eaves, and half-timber in the gables.

Stone (New York).—Forty years ago King Ludwig II., of Bavaria, had the desire to build a new castle, and though there was no money in the exchequer and his last castle was still unfinished, designs were prepared by the Court theatre-artist Jank and given into the hands of Von Riedel, the Court architect. To-day Neuschwanstein rises from the summit of a great crag surrounded by snow-capped mountains and the sparkling waters of the Schwan and Alpsee. On such a site a mediocre building would look fine, and this is exactly the case with the King's castle. The style has been termed Romantic-Romanesque! Two illustrations of it are given in the December issue of this publication.

Harper's Magazine.—With Victor Hugo the author everyone is familiar, but with Victor Hugo the artist few are acquainted: yet of his ability to draw we have some surprising examples in the February issue of this magazine. Hugo taught himself, and when voyaging up the Rhine he sketched almost all the old castles and palaces which he saw; and more, when he returned to France, he rediscovered them, changed them, and produced on paper numberless castles of his own imagination, castles which, by the way, were astonishingly unmindful of architectural style. Then he carved and made furniture, and finally attempted etching under the tuition of Maxime Lalanne. He certainly carried into his drawings that strong imaginative power which made his writings so remarkable, but the efforts are of little artistic value in themselves, though most interesting as exemplifying another side to Hugo's character.

The American Architect.—Referring to the paper on "Colour in Architecture" read recently by Mr. A. Wallace Rimington before the Architectural Association, our contemporary remarks in the issue for January 5th that it was, unlike most essays on this subject, full of practical suggestions. "It is hardly necessary to say that the day of alternate voussoirs of black and red brick, and of blue tiles between the consoles of cornices, is over; but the architect has still to deal with many problems of colour, in which a little of the painter's learning can be used to advantage." The plates in this issue are largely devoted to British furniture at the Paris Exhibition. It is satisfactory to hear that our cabinet-makers and decorators, "amidst all the mad rush for novelty, seem to have kept their mental balance better than their Continental competitors. Some indications there were that the inspiration of the 'Elizabethan,' 'Chippendale,' 'Sheraton' and 'Heppelwhite' is still sought, but, on the other hand, many of the exhibits made it perfectly clear that the old styles have met with a powerful rival in that the inception of which is unquestionably due to the arts and crafts. Fortunately, specimens of that abomination the British Louis style—a bastard caricature of the Louis Quinze—were not in evidence. and in its place were productions marked by a refinement—sometimes extreme severity—of line calling for not a little commendation. . . . We have said that this modern style of British cabinet-work owes its origin largely to the arts and crafts, and some of the pieces shown are just such as the strict disciples of Morris—in fact, the Society—revel in. But designers of broader views, while working on similar lines, do not believe that all cabinet-work should be strongly reminiscent of the carpenter's shop, and of these none displayed better work than did the Bath Cabinetmakers Company, Limited. . . . Considered as a whole, the British display in the groups devoted to furnishing and decoration appeared extremely meagre as compared with those of many other countries, but the exhibits, when studied individually, were by no means devoid of interest." The issue for January 12th contains a paper by Mr. C. Howard Walker on "The Grouping of Public Buildings in a Great City," read before the annual convention of the American Institute of Architects. We hope to print this paper shortly. Among the plates are two of the extensions to the Granville Hotel, Ramsgate (Horace Field, architect), and the Convalescent Home at Littlehampton, Sussex (Frederick Wheeler, F.R.I.B.A., architect). These are not worthy specimens of current British architecture. The issue for January 19th contains an article on "The Traceries of the Great Pointed Windows of the Ducal Palace at Venice."

Carpentry and Building (New York).—We learn from the February issue that New York is to have a large new hotel—the Astor—possessing several unique features. It will be sixeen storeys high, thus making it the tallest building of its class in the city. Among the unique features of the building will be "movable pantries" in the shape of two high-speed electric lifts, fitted with electric heated tables, which will convey food from the kitchen to the top floor in a minute and a half; also an artesian well to supply all water, a refrigerating plant, as well as a complete electric lighting and telephone service. All of the large apartments will have servants' rooms, a servants' bathroom and sitting room. The contract for the structural ironwork of the hotel calls for 4,000 tons. Some particulars are also given in this issue of a thirty-storey office building which it is proposed to build. A site having a frontage of 118½ft. on Broadway and about 98ft. on Thirty-third Street has been secured by a company. The building will overtop the one on Park Row, heretofore the tallest by considerably more than 50ft. Measured from the level of the curb to the tip of the iron ornament of the roof the height will be 455ft.

Blanco y Negro (Madrid).—This paper is of little architectural interest, but those interested in wash work will find some excellent specimens in it. Colour work—often most effective—is another feature.

Berliner Architekturwelt.—In the current number are reproduced the winning designs in the competitions for a church at Zehlendorf and a monument to Frederick the Great at Charlottenburg. In the former the first premium was awarded to Hubert Stier, Hanover, the second to Kickton, Potsdam, and the third to F. Lorenzen, Hamburg. In our opinion the second is the best, though none exhibit special ability. The competition for the monument to Frederick the Great has been more successful, and the winning design (by J. Welz and Otto Richter) is most effective. Some examples of modern German furniture are included in this number, as is also a second plate of "Old Berlin" equally as uninteresting and inferior as that published with the previous issue. It may, perhaps, be mentioned that this publication is restricted to Berlin and the work of Berlin architects and artists.

Die Kunst for January contains a number of excellent studies of heads by various artists and several reproductions of the work of Eduard Beyrer, jun., who is in the front rank of the younger sculptors of Munich; his work is most admirable, as is evidenced by the fountain, illustrated in the issue under review, consisting of a female figure holding a vase under each arm, out of which the water pours. Some architectural designs by Schilling and Gräbner, of Dresden, are also reproduced: one or two of them are atrocious, but several have much merit. Novelty at any time is better than dead commonplaceness. The February issue is a most interesting number. Many illustrations are given of furniture by Mr. Charles R. Mackintosh, of Glasgow, Mr. Ashbee, and other similar exhibitors at the eighth exhibition of the Vienna "Secessionists." Some of the designs are strange and wonderful.

Engineering Notes.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied some more of their patent Manchester stoves to the Union Infirmary, Guildford.

New Post Office, St. Annes-on-Sea.—This building has just been fitted with the latest improved hot-water heating apparatus by John King, Ltd., engineers, of Liverpool.

Tramways in the City.—The Court of Common Council decided last Thursday to oppose the scheme of the London County Council to construct a line of tramway within the City. This was agreed to on the ground that the Bill did not contain provisions for the protection of the public at Ludgate Hill and Snow Hill stations.

An Electricity "Combine."—At Montreal a large trust, called the Lighting and Power Company of Montreal, is being formed to include all the companies now supplying the city with illumination and power. There is much opposition to the combination on the part of consumers, and a powerful lobby will be sent to the Provincial Legislature to try to block the scheme. The directors, however, profess to have no fear of a failure in their enterprise.

Hampstead Underground Railway. — The General Purposes Committee of the Hampstead Borough Council have reported that they are of opinion that a clause should be inserted in the Hampstead Railway Bill prohibiting the company from generating or supplying electricity within the borough; that no station should be situated within the boundaries of Hampstead Heath; and that the elevation of the stations should be first submitted to the Council for their approval.

Easton and Company, Ltd.—This company, whose address is at Broad Sanctuary Chambers, Westminster, S.W., has acquired the business of Easton, Anderson and Goolden, Ltd., together with the works, machinery, patents and patterns. The firm has also—after a full and satisfactory investigation made by Professor Ewing, F.R.S.—secured the sole license for Great Britain and her Colonies for the manufacture and sale of stationary engines of over 10 h.p. superheaters, economisers, and other apparatus under the Schmidt patents, for the utilisation of highly superheated steam.

"The Universal Electrical Directory (J. A. Berly's), 1901."—This book, of which we have received a copy, comprises the names and addresses of 28,586 members of the electrical and kindred industries throughout the world, approximately 2,189 names more than were contained in the book for 1900. For simplicity and facility of reference it is divided into four groups, namely, British, Continental, American and Colonial, which are again sub-divided into alphabetical and classified sections; in the case of the British a Geographical Section is given, making in all nine sub-divisions. Altogether there are about 1,250 pages entirely of directory matter. The price is 7s. 6d.; abroad, 8s. 6d.

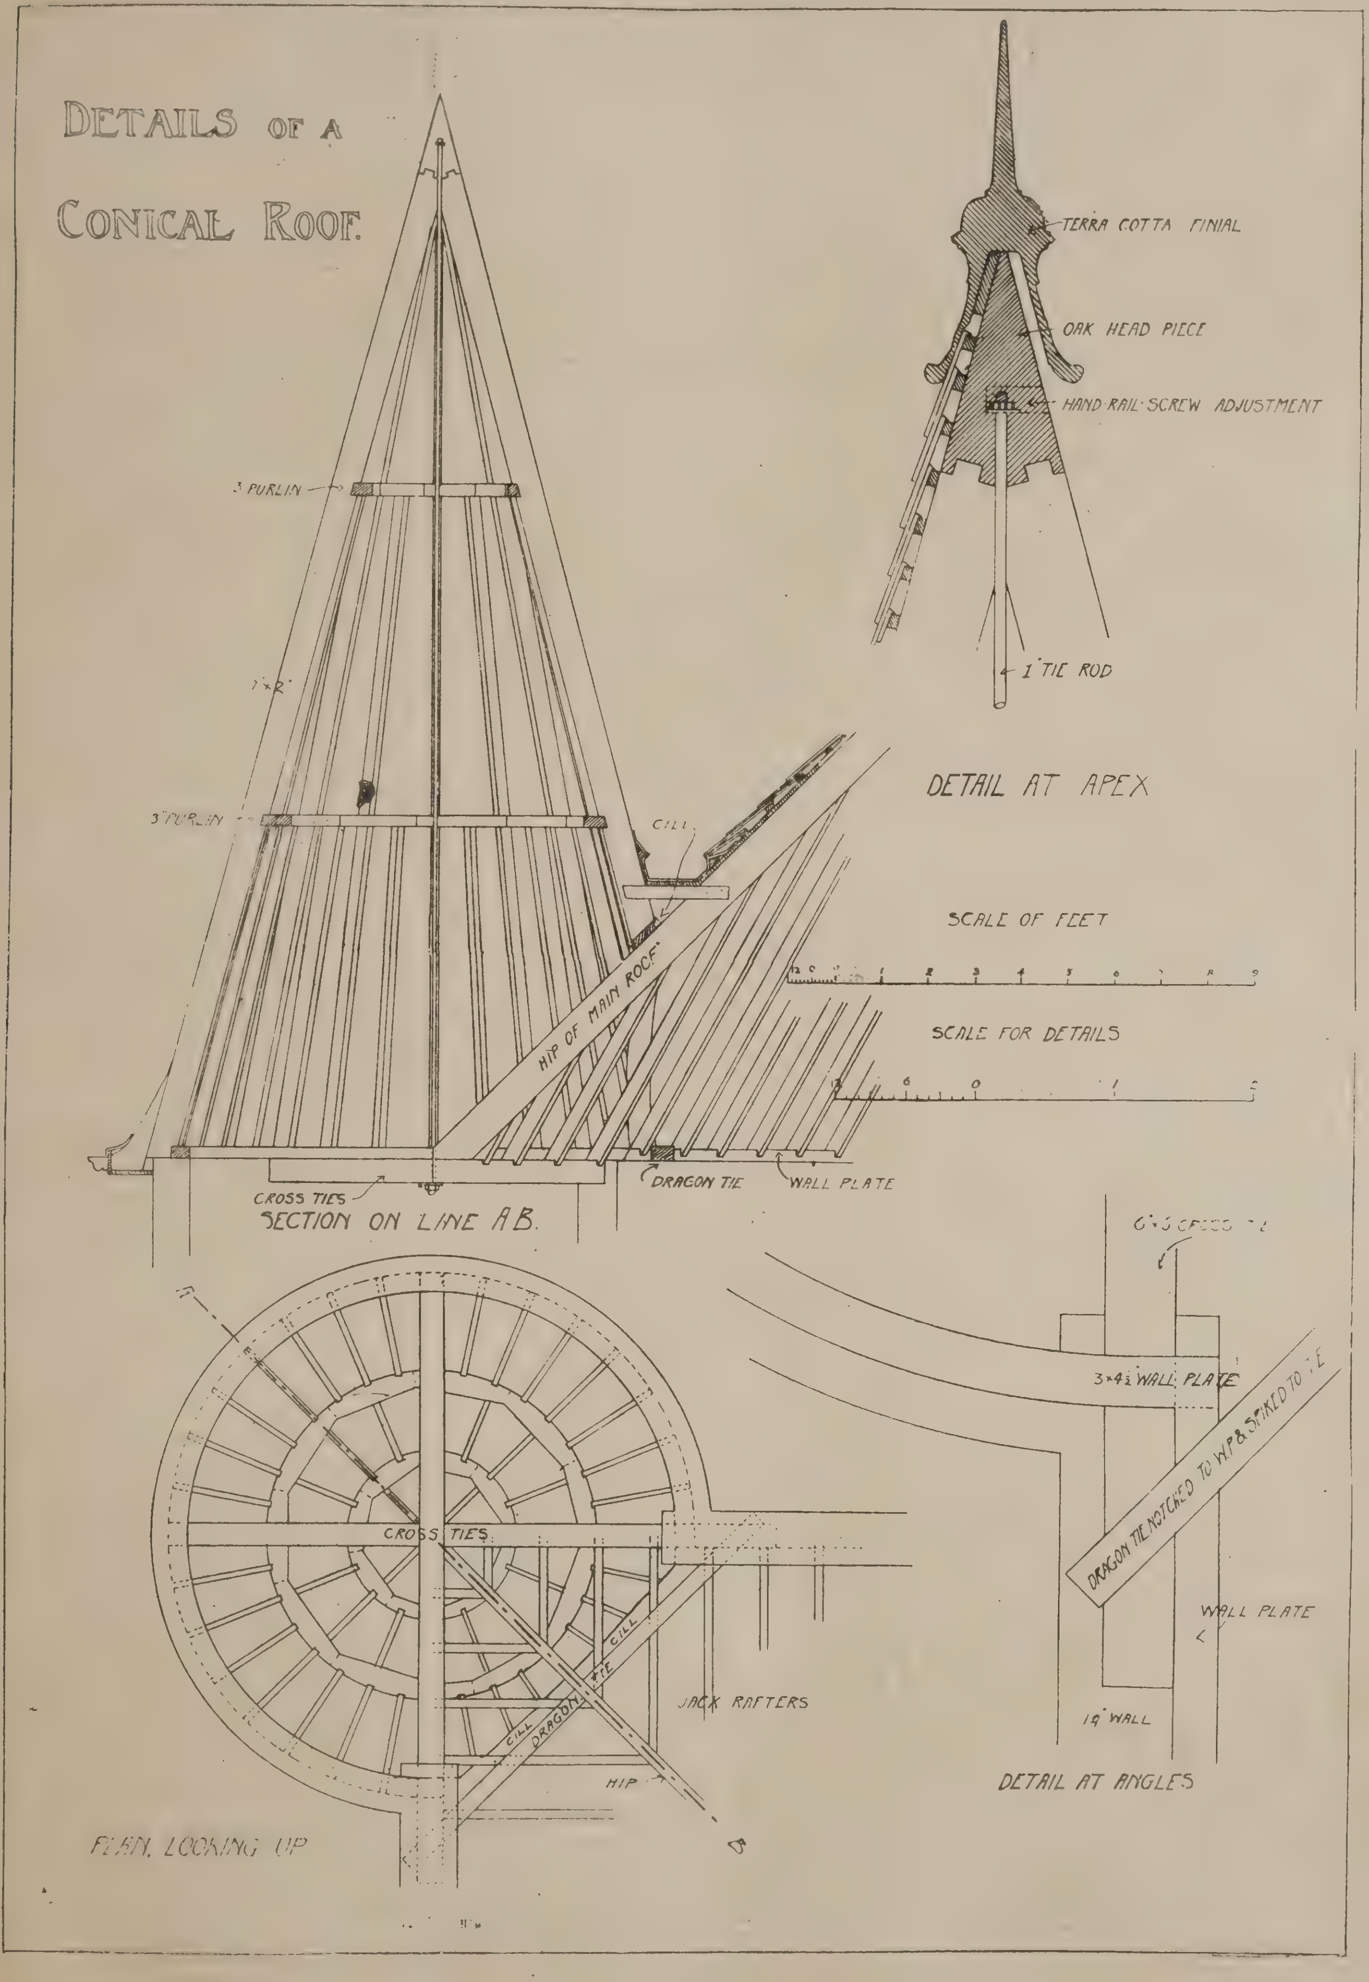
Tramway Expansion.—At the recent general meeting of the members of the Tramways and Light Railways Association, the Chairman said that the Association was formed about eighteen months ago to develop means of transit throughout this country, chiefly by means of electricity. The development of tramways here had not been commensurate with that which had taken place in other countries. Thus, in the United States in 1890 there were not more than 150 miles of tramways; now there were 20,000 car miles. In this country only about 175 miles had been added since the date mentioned; and altogether there were not more than 1,200 miles. One advantage would be the reduction in cost from 5d. to 8d. per car mile, in place of 9d. to 1s. by horse power. The great hindrance to tramway expansion here was the restriction put by law and regulation upon it. There were two Acts of Parliament which did this, the Tramways Act and the Light Railways Act; these the Association hoped to amend.

A Remarkable Bridge Collapse.—On Thursday last Buckie Burn Bridge, Banffshire, which two days before had been formally christened the "Queen Victoria Bridge," collapsed suddenly and completely. Fortunately no one was killed. Steadily for a week a fierce storm had played upon the structure, which was just on the point of leaving the hands of the contractors, Messrs. Stuart and Sons, of Peterhead; on Wednesday night the gale was felt in full force up the valley of the Burn. The two central piers, built of masonry, hearted with concrete, 6ft. 6in. wide at the base, tapering to 4ft. 6in., collapsed under the strain, there being, it is computed, fully a thousand tons of superstructure resting on them. The three arches, two of 25ft. and one of 34ft., went bodily into the valley 40ft. below, snapping off like a pipe stem at the granite pilasters, and leaving a yawning gulf 100ft. wide. The debris, consisting of bricks, scaffolding, granite blocks, concrete, stones and sand, completely choked up the valley and dammed back the burn, which is in flood, forming a lake 20ft. deep and extending far up the valley. The constructors began the bridge on August 4th last. A month ago the Town Council decided to add 3ft. of extra height to the superstructure, and this, after having been approved by the consulting engineer, had just been done when the disaster happened. The roadway was 45ft. wide. Each of the smaller arches was circled with three rings of brick, a coating of 6in. of cement being laid over all, the central span having four rings. Peterhead granite was largely used in the erection.

DETAILS OF A CONICAL ROOF.

By R. W. CARDEN, A.R.I.B.A.

THIS turret is taken as occurring at the angle of a large hip-roofed building in such a way that the foot of the hip has to be carried independently of the walls. Two 6in. by 6in. cross-ties are placed diagonally across the turret and the hip is carried by these, the cross-ties resting upon stone templates. The wall-plate (dotted on plan) is carried round above the cross-ties, properly halved at the two angles, and the outward thrust is counteracted by the dragon-tie, which is notched to both wall-plates and spiked securely to the cross-ties in order to keep them in position as well. An angle piece to the hip has not been shown, but it could easily, and perhaps with advantage, be added. The main difficulty is reached when dealing with the rafters, as the framing at the apex is complex, and when done, if there are many rafters, most unstable. In this example they are carefully reduced in number until only eight run up the whole height, half the total number being stopped at the first purlin and half those remaining being stopped at the second one. The head-piece is of oak, mortised to receive the heads of the rafters, drilled for the head of tie-rod, and mortised again for the insertion of the nut. This tie-rod (of 1in. diameter) is carried down through the intersection of the cross-ties and can be easily tightened up from the underside so as to keep the whole of the roof rigid. It will be noticed that the shorter jack rafters of the main roof where they do not butt down to the wall-plate are notched on to the cross-ties. At the intersection of the two roofs a 2in. sill-piece has been fixed to the jack rafters of the main roof and the rafters of the turret brought down upon and notched into it. The covering may be of tile, slate or metal, but in the last case boarding would of course be indispensable.



DETAILS OF A CONICAL ROOF

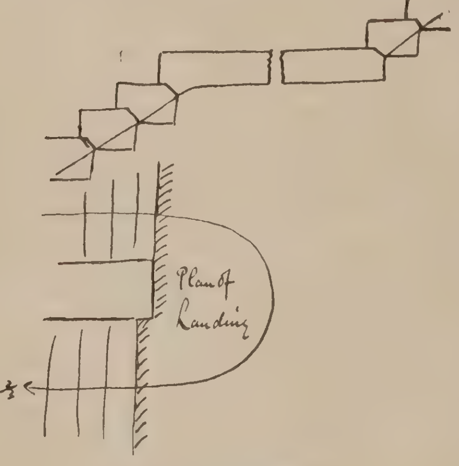
Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stone Staircases.

GALLATOWN.—KIRKCALDY writes: "What rule is there for determining the thickness of stone or brick staircase walls having stone feather-edged steps pinned into the wall at one end only and hanging 5ft. into staircase with a well-hole between the open ends 2ft. wide? The stair in the instance referred to is composed of a series of straight flights with level landings of stone or concrete. The total height from ground to top floor is 52ft., each storey being 13ft. high. Should any special precautions be taken in regard to the fixing of the stone or concrete landings or the joint of top step of each flight with same?"

The brick walls in question should be for the three lower storeys 18in., and the top storey 14in. The steps should go into wall 9in. and should have a solid end to ensure a horizontal bed (see accompanying sketch, which also shows the joint of landing with top step and the step starting from landing). The precautions to be taken in fixing steps and landings if the same are not built in as the walls are raised are—(*a*) sand courses should be left for steps; (*b*) wherever landings go into a wall a course of stout Yorkshire paving or of thin landings should be laid; over that, three courses of bricks with sand, 9in. only; and over that another course of landings to go through the whole thickness of the wall. When the staircase is ready for fixing, the bricks are taken out with little trouble, and without injuring the wall in the least. The landings in all public buildings should be arranged in this manner. Great care should be taken when pinning the wall to see that it is made quite solid with grout.



STONE STAIRCASES.

I. W.

Classes in Building Construction.

LONDON, W.—F. H. writes: "I should be glad to know of any technical school where evening classes in building construction are held during the summer months."

All classes in this subject begin about the last week in September and end some time in May, generally with the South Kensington Examination. At the City of London College the classes meet on the afternoon of the examination for a final coaching and the week after the examination to enable the teacher to confer with the students as to their difficulties and to show them how the questions should have been answered. It would hardly be possible to get enough students together in all London to form a class during the summer months for this subject; it is quite enough for them to work hard all through the winter.

HENRY ADAMS.

Moment of Inertia.

ILKLEY.—R. F. writes: "Can you explain exactly in everyday words the meaning of 'moment of inertia'? Is it equal to the area of the section multiplied by the radius of gyration or the square of the radius of gyration? 'The Builder' (December 1st, 1900, p. 488) and 'Rivington' (Vol. IV., p. 332) seem to differ on this point. What is meant by radius of gyration, and how is it found for any general section? Does Gordon's formula for struts depend on it?"

In order to attempt the solution of the problem set we must first define what is meant by "inertia." Newton's first law of motion is as follows:—Every body continues in its state of rest or of uniform motion in a straight line except in so far as it is compelled by force to change that state. Now every body, according to the law, preserves its "state" of rest or of motion in a straight line when not acted upon by other forces, and it is this property (this "state") which is designated the inertia of matter, in virtue of which it is incapable of varying in any way its state of rest or motion. It may be the spot of forces for any length of time, but so soon as they cease to act it remains in the state in which it was left until they recommence their action upon it. The centre of inertia or mass of a body is a point whose distance from any plane is equal to the sum of the products of each mass into its distance from the same plane divided by the sum of the masses. This point coincides with the centre of gravity, but it must be borne in mind that the centre of gravity differs radically from the centre of inertia; for while every agglomeration of particles into a body has a centre of inertia, we can only approximately say of it that it has a centre of gravity. We do not see that such a definition as that of "moment of inertia" can possibly be put into everyday words, for it deals with subjects which are out of the pale of ordinary commonplace. In a rotating body it is the sum of the products formed by multiplying the mass of each particle (forming a part of that rotating body) by the square of the distance (of that particle) from an axis, or "the moment of inertia of a body about any axis is the sum of the products of the mass of each particle of the body into the square of the particle's (least) distance from the axis."

Another, and possibly more generally comprehensible, definition is that it is the sum of the products made by multiplying the number of units in each mass by the number of units in the square of its distance from the axis. If "Rivington" (Vol. iv., p. 111) be referred to, it will be seen that

$$(\text{radius of gyration})^2 = \frac{\text{moment of inertia of the cross section}}{\text{area of cross section}}$$

This is correct, and gives as easily understood a definition of "radius of gyration" as it is easy to find. "Rivington" continues: "The value of the M.I. of the cross-section varies according to the axis about which it is taken, but when taken about an axis through the C.G. of the cross-section, perpendicular to the direction in which the column tends to bend, it is a minimum, and the radius of gyration found from this M.I. is the one to insert in the formula." The formula referred to is given on the previous page, and is that of Rouleaux; but consideration of what follows will show how and in what way Gordon's formula also depends on the radius of gyration.

G. A. T. M.

Workmen's Compensation Act, 1897: Insuring of Architects' Assistants.

DUNDEE.—FORFAR writes: "It has been represented to us that under this Act we, as architects, should insure our assistants and apprentices against accident or damage incurred on any building which we are erecting or otherwise in our employment. It seems to us that our men must be classed as professional men not as workmen, and that we are not contractors in any sense of the word."

You would not be liable under the Act, as you do not undertake the construction, repair or demolition of buildings; therefore you need not insure.

A. O. H.

Lightning Conductors.

LOUGHTON, ESSEX.—S. H. J. M. writes: "Why do some experts recommend non-insulation of lightning conductors; is not the electricity in such cases liable to go from the tape into the copper clips and so enter the wall?"

"S. H. J. M." is scarcely correct in the wording of his question. I do not think *any* expert recommends the use of insulators. Insulation for a small current such as would be used for an electric-bell circuit may be very thin; for the more powerful current in electric-light leads it must be thicker, and so on till we get to a conductor carrying a discharge of lightning, for which insulation would require to be about 5ft. thick (or, say, 10ft. diameter) to be effective, because sparking from an improperly applied lightning conductor might take place to nearly that length. Therefore insulation by means of glass insulators is impracticable. They do harm, because the conductor is intended to reduce the likelihood of the building being struck by the lowering of potential through brush discharge at the points, and insulating the conductor, though it would still permit reduction of the potential of the earth, would leave the building charged, and therefore liable to be struck.

When a conductor is struck the potential is momentarily raised to an enormous extent, and this extends to the fastenings or other metals in contact with it, and sparks will pass to adjacent metals to which it is not connected, especially to gas and water pipes; but if this occurred it would show want of knowledge in the planning of the conductor. Sparking does not occur merely into brickwork: it is a local effect between two planes at different potentials—in one case between cloud and earth, in the other between the conductor and any metal dangerously near to it, say an iron safe on the inside of a 14in. wall, and just behind the conductor. The question of what metals will lead to sparking and what will not is one of the most difficult branches of the subject, and cannot be explained here. Sparking from a properly and scientifically applied conductor fixed in contact with the building will not occur.

ALFRED HANDS.

Book on Heating and Ventilation.

NEWCASTLE-ON-TYNE.—A. J. R. writes: "Kindly inform me of a good and inexpensive book on heating and ventilation."

"Hood on Warming and Ventilating," rewritten by Frederick Dye, price 15s. E. & F. N. Spon, 125 Strand, W.C., are the publishers. "Ventilation and Warming of Houses, Churches, Schools and other Buildings," by Prof. E. H. Jacob, price 1s. 2d. post free, is useful. It can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C.

Books on Architectural History.

WOLVERHAMPTON.—W. V. V. writes: "Which are the best books for the study of architecture, dealing with both the Classic and Gothic periods? Is there such a book as a history dealing with architecture from the earliest time down to the present, fully illustrated, with proportional diagrams of mouldings, caps, vaulting, &c.? Is Professor Banister Fletcher's 'History of Architecture' a concise and explicit work on the subject?"

"Fergusson's History of Architecture": Ancient and Mediæval, two vols., £2 9s.; Indian and Eastern, £1 5s.; The Modern Styles, two vols., £1 5s., is the most complete history we can recommend. Complete sets (5 vols.) can be obtained from Mr. B. T. Batsford for £3 18s. Professor Banister Fletcher's "History" is a very concise and useful work; it can be recommended.

Sound-proof Walls.

NORTH SHIELDS.—P. J. S. writes: "What would be the best and cleanest method of deafening a floor without removing the floor boards if possible? What would be the best material to use, and the easiest way of fixing it?"

An illustrated article is in hand on the protection of houses from damp, cold, heat and noise. This will doubtless supply our correspondent with the information he desires.

Contract Signed by Builder's Foreman.

HALIFAX.—TOMAS A DOUBTFUL writes: "Two tenders by a contractor for mason's and carpenter's work were accepted, but instead of calling to sign them himself his foreman did so, signing the contractor's name (per pro) with his own below. Is the foreman's signature binding on the contractor? Some dispute has arisen. Can the contractor refuse to go on with the work, or is the fact of having allowed the work to proceed in his name sufficient to bind him to complete the whole?"

If the foreman was authorised either expressly or impliedly to make the contract, the contractor is bound, no matter what position the foreman occupied, and if the contractor were not bound in the first instance his allowing the work to go forward would render him liable.

A. O. H.

Removing Rainwater Pipes.

SCARBOROUGH.—ENQUIRER writes: "My clients have bought four houses which face a private passage belonging to them. They intend to pull them down and to build a workshop over the whole site. There is a rainwater pipe at the end of their passage which goes into the ground (no gully being there) and taking the rainwater of adjoining property. The drain to the four houses may go to the end of the passage, and this pipe may go direct into it, but this is not thought so. It is all very old property. Can we take down this rainwater pipe, or what course should we adopt?"

As it would appear that the rainwater pipe has been in its present position for considerably more than nineteen years, your clients have now no legal right to remove it or to compel its removal. Your best course would be to approach the owner of the adjoining property and endeavour to arrive at some arrangement which would be satisfactory to both parties. If the owner is a reasonable man, he will probably have no objection to some suitable readjustment being made, provided that your clients bear all the expenses in connection therewith.

T. E. C.

Book on Trigonometry.

BARKING, ESSEX.—J. C. B. writes: "Kindly name a book on elementary trigonometry. Please give me plan of village school, accommodation for 200, showing boys' schoolroom and girls' and infants' room combined. Site is quite open and situated at corner formed by two roads meeting at right angles.

Lock's "Elementary Trigonometry" (Macmillan and Company), 4s. 6d. We desire to inform our correspondent that it is not our business to supply plans in the manner he suggests. He had better consult an architect.

"Scotia" or "Scocia."

SOUTHPORT.—SOUTHPORT writes: "Which is proper, *scotia* or *scocia*?"

The correct spelling is "scotia." The word comes from the Greek *skotia*, which means, literally, darkness: the surface of the moulding is in shadow.

Window Tracery.

NEWPORT, MON.—PROBATIONER writes: "Is there any rule for finding the centres of the various curves in the tracery of a Decorated window (assuming that of the arch is known)? What amount of architectural knowledge is required for Honours Building Construction (the syllabus is very indefinite)? Which are the cheapest books on architecture sufficient for the intermediate R.I.B A. examination?"

All window tracery is based upon a geometrical outline of the various parts, but no general rule can be laid down, as each window is more or less an original design, and the centres are taken accordingly. Some of the larger works on architecture show portions of the windows in geometrical outline with the centres, and the remainder finished completely. Some elementary examples are given in Davidson's "Gothic Stonework" (Cassell and Co.).

In Honours Building Construction a general historical knowledge of the leading buildings and architectural styles of the world is required, with ability to sketch from memory the more important Classic and Gothic details. For books on architecture, see the syllabus of the R I.B.A. examination.

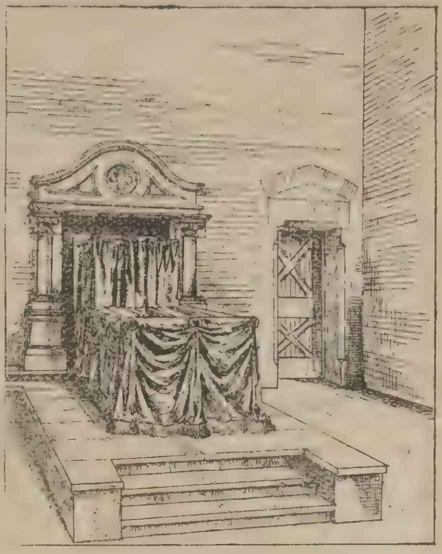
HENRY ADAMS.

HULL CREMATORIUM.

THE first definite step towards the erection of a crematorium in Hull was taken on October 3rd, 1892, when, at a meeting of the Burial Committee of the Corporation, it was decided that the Borough Engineer (Mr. A. E. White) should prepare plans of such a building so that the Corporation might be in a position to proceed with it on receiving the authority of the Local Government Board.

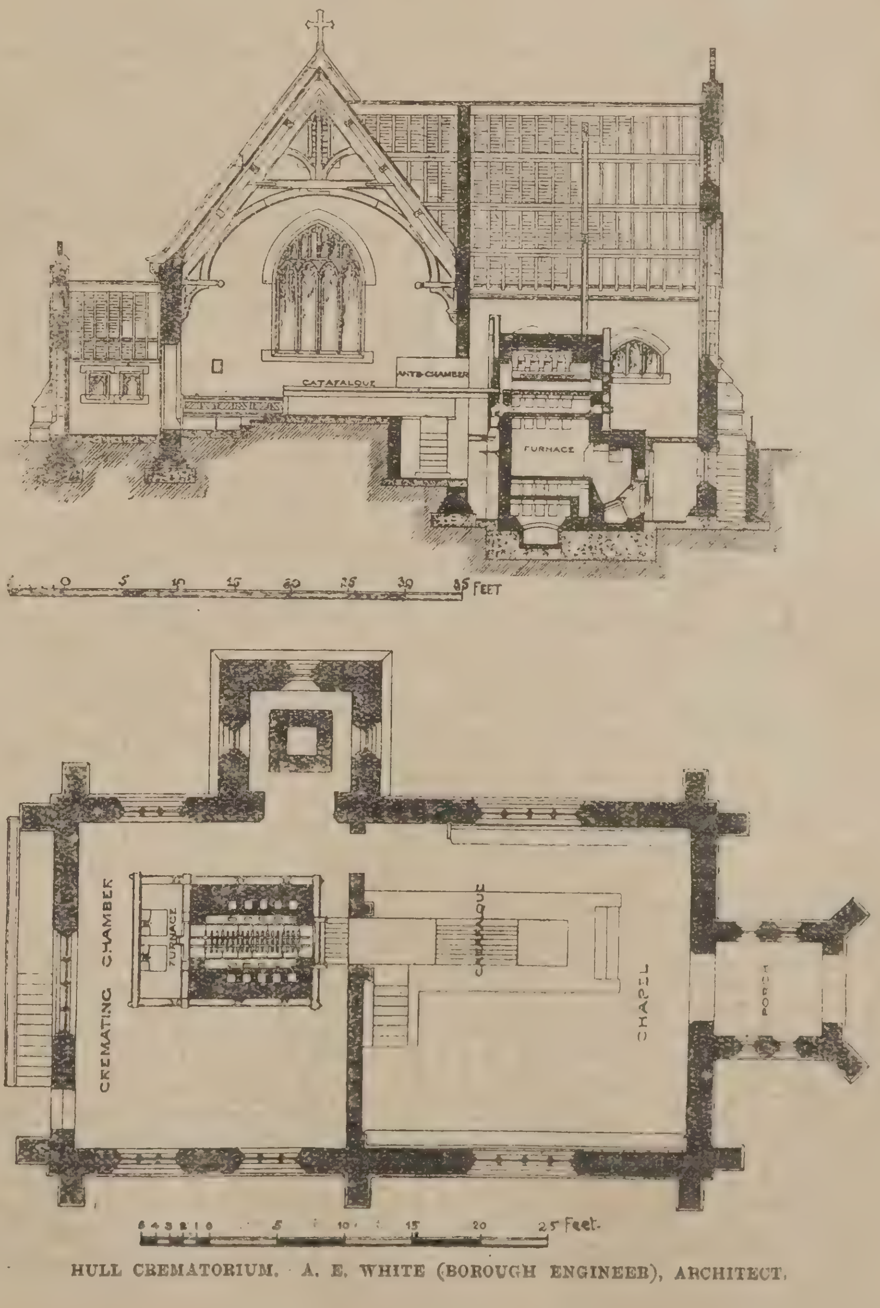
The Council at this time contemplated the erection of a chapel in the Western Cemetery. The Borough Engineer suggested the modification of the plans so as to include a crematorium. The suggestion was adopted, and when the chapel was erected in 1896-7 foundations were put in for a furnace chamber and chimney tower, so that these might readily be added at any future time.

Meanwhile, as it appeared doubtful whether municipal authorities could legally expend money on crematoria, it was decided to apply for Parliamentary powers, which in due course were obtained. Plans were then prepared by the Borough Engineer, and the building was opened on January 2nd last. It is the first municipal crematorium erected in this country.



THE CATAFALQUE.

The building is situated on a piece of land



HULL CREMATORIUM. A. E. WHITE (BOROUGH ENGINEER), ARCHITECT.

to the north-east of the Hedon Road Cemetery, and is of red brick externally, with artificial stone dressings; the style is early Perpendicular, freely treated. It comprises a hall or chapel 24ft. square, a second room containing the incinerating chamber, and a tower 70ft. high. The cremating apparatus is a furnace of the regenerative type, designed by the late Mr. Henry Simon, president of the Manchester Cremation Society. Described in the briefest possible manner, it consists of three interior chambers, the two lower of which are surrounded by air-passages. The lower chamber contains a coke fire, and the upper one is that in which cremation takes place. The fire is lighted some hours before the apparatus is to be used, and is supplied with air in the usual way. By the time the apparatus is ready for use the walls of the air-passages are thoroughly heated. Most of the direct air-supply is then cut off, and the partially-consumed gas (carbonic oxide) from the coke is allowed to mix in the second chamber with the air heated by passing through the side air-passages. The incinerating chamber is thus filled with gas of an intensely oxidising character in a state of incandescence. The degree of heat can be regulated in the most exact manner. There is no smoke and little visible flame before the body is introduced, and if the coffin is made in accordance with directions, there is equally no smoke and no noise during cremation. The process occupies about one hour, at the end of which there remain only the inorganic bases of the bones. These are in the form of silvery grey pumice-like fragments, which are removed by passing an asbestos brush through the chamber, which causes the remains to fall through an opening into the urn which is to receive them; they are not otherwise handled in any way.

It should be explained that the interior of the cremating chamber is at no time visible to mourners. The coffin, when brought into the chapel, is placed upon a catafalque. When the committal sentence in the religious service is reached, it passes noiselessly by means of an invisible mechanical arrangement through curtains into an intermediate chamber, and the curtains fall behind the coffin before it enters the cremating chamber.

Professional Practice.

Aberdeen.—The extension of the Fish Market has recently been completed, with the exception of the offices, which will not be ready for occupation just yet. The new building, which extends practically the whole length of the quay, along South Market Street, has a length of about 430ft., and has a width of 50ft., which is about 14ft. wider than the old portion. The outside of the wall to South Market Street has red Ruabon bricks, while the inside is laid with brown glazed Ruabon bricks. The erection is on the same lines as the old part, being open at the front. The roof, which is constructed of wood and slated—not of corrugated iron like the old building—is supported by steel girders laid on a double row of pillars, and from its construction it can be adapted for storage purposes if necessary. The building will be electrically lighted, twelve arc lamps having been fitted up—six being erected at the front of the market and the other six at the back. The building has also those accessories necessary at a fish market, such a water-taps, benches, &c. The floor is entirely laid with concrete. The offices will be a two-storey erection situated at the junction of the old and new portions of the market, and is 91ft. by 50ft. The base of the outside walls is constructed of brown glazed Ruabon bricks, while the upper portion is of red bricks, variety being lent by belts of pink bricks. The windows on the ground floor are arched, with pink facing and key blocks. The apex at one end of the roof bears the representation of a fish, while the other bears that of a ship. Telegraph and superintendent's offices will be on the ground floor, while the upper floor will be utilised as berthing master's office, collector's office, restaurant, &c. There will also be several spare rooms. The contractors were:—Mason, Charles Gordon; carpenter, George Jamieson; slater, Forbes Morrison; plumbers, J. Blaikie and Son; painter, John Williamson; plasterers, Sellar and Company. The architect was Mr. R. G. Wilson. The total cost of the new addition to the market is about £5,000.

Arbroath.—New shambles have recently been erected on the piece of ground formerly occupied by the Arbroath Sawmill Company, entrance being obtained from North Grimsby. The two-storey buildings adjoining are to be used as offices and dwelling-houses for the sub-inspector and caretaker, while on the right-hand side is a lofty and well-ventilated dead-meat house, in which accommodation can be had for about 200 carcasses. Separated by a causewayed road are the slaughtering booths, of which there are five—three single and one double. At the rear of the killing booths the byres, capable of accommodating sixty cattle, and a large sheep pen, with separate killing-house, are situated. The byres are well ventilated, and are fitted with automatic-watering troughs. A third range of buildings contains a hide and tallow shed, two loose boxes for cattle, a piggery, a boiler and engine-house, and a spare booth of considerable dimensions, A section of the upper part of this range is to be utilised as a hay and straw loft. For animals newly brought in and showing signs of restlessness a large open court, with concrete floor and enclosed with strong iron railings, is provided near the gateway. The buildings were designed by Mr. Hugh Gavin, architect, Arbroath, and the contractors were:—Mason and brick work, Messrs. Ramsay and Gordon; joiner work, Mr. James Robertson; slater work, Messrs. Mitchell and Son; plumber, Mr. Dyer; plasterer, Mr. A. Patterson; painter, Mr. Anderson; smith work, Messrs. Peter Herron and Son; engineer, Mr. Bruce, Dundee.

Huddersfield.—The Theatre Royal and Opera House has recently been extensively altered and repaired at a cost of £5,000. The plans and specifications for the whole of the improvements, alterations and decorations were prepared by Mr. Sydney Ingham, architect, of Southport. The principal entrance has been entirely reconstructed, with the result that new exits from the pit and upper circle have been made into Ramsden Street, whilst there is a new exit from the orchestra stalls into Bull and Mouth Street, and an additional emergency door made from the stage into Little Queen Street. The dressing-rooms, which are in the basement under the pit floor, have been rearranged, enlarged, and increased in number. The walls have been newly plastered and finished with Keen's cement, and the dressing-rooms supplied with hot and cold water. The dress circle entrance is by a new fireproof floor, on steel joists and concrete, finished with Terazzo marble flooring. The new box office fittings are of mahogany. The old wooden staircase to the dress circle has been superseded by a fireproof one consisting of moulded stone with brass handrail and mahogany dado. The front portion of the entrance hall is of moulded and panelled mahogany, with plate glass in the upper panels and the remainder of slightly-tinted glass. The dress circle has been increased in area by the removal of old storerooms in the two wings of what will now be the new promenade. New cloak-room accommodation has been obtained near the entrance to the dress circle by reducing what was formerly the refreshment bar, which is now considerably smaller than it was before. The dress circle is supplied with new chairs by Messrs. A. R. Dean and Co., upholstered in blue plush with gilded iron ornamentation. Chairs similar in design are in the upper circle and orchestra stalls. The boxes on each side of the dress and upper circles have been reconstructed with a view to securing a better sight-line to the stage. The walls of the dress circle have been covered with a blue paper; the ceiling and pillars have been decorated with Duresco ceiling. In the upper circle the floors have been reconstructed, and the cloak-room and lavatory arrangements increased on the same lines as those in the dress circle. The gallery has also had new seats provided, and new windows knocked into the walls facing into Ramsden Street. The ceiling of the whole building, which has been lowered, is now constructed of fibrous plaster of an elaborate design, and contains panels in which are inscribed the names of noted dramatists and composers. Under the new arrangements the stage will be entirely shut off from the auditorium by a fire-proof curtain, for which cast-iron grooves have been fixed on each side. The other openings in this wall are all of iron. In addition, an arrangement of automatic sprinklers, which come into operation in case of fire, has been fixed. There has also been a new installation of the electric light. The lighting arrangements throughout the house are controlled by a switchboard at the corner of the stage. A new system of heating and ventilating has also been carried out throughout the house.

Leicester.—The old Trinity Hospital, built over five and a half centuries ago, has now been partly demolished; some portion of the building will, however, form part of the new hospital which is to be erected. Some of the graceful arches, which in the earlier days of the hospital flanked the centre aisle and gave support to the heavy and substantial roof, are to be allowed to remain, while the quaint chapel at the eastern end of the hospital will stand untouched. In appearance the building will be entirely altered. It will be more than double the dimensions of the old hospital. The architect is Mr. J. Goodacre. As stated, eight of the old arches will remain at the front and back of the building, and those facing the street will be filled in as they were before, but with red brick, and will form the front elevation. The windows will be very much larger, adding to the light of the interior. The principal entrance will be in this portion of the building. The old portion of the building will not contain any living-rooms for the old people who are now housed, but will form a meeting-place for all who prefer not to remain in their own rooms. To the right of the entrance will be the men's day-room, an airy and comfortable apartment 36ft. by 20ft., and as high as the building itself. It will be properly furnished and the walls will be panelled. The entrance-hall itself—about 24ft. by 20ft.—merges into the ambulatory, about 10ft. wide and extending the length of the old portion of the hospital, and terminating in the chapel. The remaining space is divided into rooms for the doctor and the porter. The street frontage of this part of the building, exclusive of the chapel, will be 104ft. The new wing of the hospital follows the bend of the street, and stretches in the direction of the canal, with a street frontage of 168ft. Like the old portion it will be of red brick, with Derbyshire stone facings. This part of the hospital will be set back about 25ft. from the street, giving a strip of turf in front. On the ground-floor there will be twenty rooms, each 12ft. by 14ft., with a corridor 7ft. wide running the whole length of the wing, and two short corridors the depth of the building to give light and air, the absence of which was a fault in the old hospital. On the first floor there will be 17 women's rooms, each 14ft. by 12ft., with a matron's room, and a commodious dayroom with a bay window gives an extensive view of the street. Each little room contains its own oven and boiler for the convenience of the old ladies who like to do their own cooking, The kitchen and the other usual offices stand away from the building, and are reached by corridors. There are to be fireproof floors and stone staircases. The west-end of the corridor leads to the gardens, which, owing to the slope of the land, will be terraced. On the ground between the hospital and the canal it is proposed at some future date to erect a small infirmary. Each inmate will have a little coal cellar or bunker at the back of the hospital, and the consumption of coal in the room of each will depend on the individual liking for a large or small fire. The place throughout will be heated with hot water coils, so that the fires embody a concession to custom and appearances. There is attached to the hospital a large kitchen where the food of the inmates is prepared; but any old lady may cook her food in her own room in the manner she prefers. It is in such slight matters as these that the difference occurs between such a place as the Trinity Hospital and an ordinary asylum for the poor.

Perth.—A new consumptive hospital at Perth is being erected at Barnhill. It is situated on a site about 600ft. above the level of the sea. There are eight wards in the building, which has been designed to accommodate from 16 to 20 patients. The hospital is faced with pressed bricks, and the centre or administrative ward is two storeys in height, the nurses' bedrooms being situated above the administrative department. The wards are one storey in height, and extend to either side, the female ward being to the west, while the male ward is at the east of the hospital. At the back of the east wing there are bathrooms, lavatory accommodation, &c., and in front there is a verandah, where the patients can have the benefit of the open air if the weather precludes them going into the open. At the back of the administrative block are dining-rooms for the patients and also for the nurses and attendants. There is a two-storey block for the kitchen apartments, larders, &c., and servants' bedrooms above. The building has been designed by Mr. J. Murray Robertson, architect. F.R.I.B.A., Dundee. The following are the contractors who are carrying out the work:—Mason work, Mr. T. S. Dick, Broughty Ferry; bricklayer, Mr. Luke Linder, St. Andrews; joiner, Mr. W. M'Quibban, Perth; plasterer and tile layer, Mr. Alexander M'Ritchie, Dundee; slater, Mr. John Walker, Alyth; plumbers, Messrs. Frew, Watson and Co, Perth; steam heating and cooking, Mr. Henry Walker and Son, Newcastle-on-Tyne. The clerk of works is Mr. William S. Cownie.

Rochester.—Suffolk House, formerly the residence of Sir Richard Head, who was elected Mayor of Rochester in 1683, has been acquired by the Capital and Counties Bank, Limited, and last week the premises were opened as a branch of that bank. The house will be the private residence of the manager, the business of the bank being carried on in that portion of the old mansion that was recently used as a shop. The old shop front has been replaced by a front of Portland stone. One of the features of the old house is the wainscotting of several of the apartments. In the bank chamber the walls will still be lined with the old deal panelling which has been untouched (but for a coat of paint) in the other portions of the house. The doors, counter and fittings of the bank are all of oak. A brass grill protects the counter. The floor of the entrance and of the space apportioned to the public is paved with mosaic, wooden blocks being used behind the counter. The heating is by hot water. The manager's room is separated from the bank by a glazed oak screen, the bay window of which, looking out over the Common, is glazed with leaded glazings bearing the arms of the bank, the arms of the City of Rochester, the arms of Sir Richard Head and also his crest. The window also displays the arms of King James II., who was the guest of Sir Richard in December 1688. The strong room of the bank is situated in the basement, the safe and strong room door being supplied by the Ratner Safe Company. As was the case with the Chatham branch, the alterations are being carried out by Messrs. West Brothers, builders, of Rochester and Strood; while the furnishings are also supplied by a local tradesman, Mr. C. A. Cobb. The architect, Mr. E. F. Cobb, A.R.I.B.A., has sought to preserve as much of the old building as was consistent with making the premises suitable for business purposes.

South Shields.—At the corner of Chapter Row and Market Square, new buildings are being erected for the Water Company. The proposed building will have a frontage of 43ft. to the Market Place, and 92ft. to Chapter Row, and will cover double the area occupied by the present offices of the Company and workshops. It is planned in two departments, communicating, one for office and public use, and the other for workshops. The building which is designed in a free Renaissance treatment has elevations to both Chapter Row and the Market Place, the latter being built on the ground floor with polished red and grey granite. The upper storeys are finished in red brickwork, relieved with moulded and carved stone work, and the whole surmounted by an ornamental stone turret. The basement comprises cellars for pipe storage and heating apparatus. On the ground floor there will be a large general office approached through a tiled hall, where separate waiting accommodation will be provided for the use of the public. Communicating with the general office are a manager's room, strong room, telephone room, &c. The remainder of the ground floor is devoted to workshops, &c. The first floor is approached by a stone staircase, and contains a Board room, out-door inspector's and other offices, and additional workshops. On the top floor a suite of dwelling rooms have been provided, together with further offices and store room. Special attention has been given to the sanitary arrangements, and the building will be largely of fireproof construction. The work which is expected to cost between £7,000 and £8,000, is being carried out by Mr. R. Allison of Whitburn, from the designs and under the supervision of Mr. Henry Grieves, A.R.I.B.A., architect, of South Shields.

St. Helen's, Hastings.—New schools at St. Helen's, opposite the Hastings Borough Cemetery were recently opened. The building comprises two floors, with covered playgrounds and a heating chamber under a part of the ground floor. The site is about an acre in extent. At present the ground floor is used as an infants' school, to accommodate 190 infants. On the first floor is the mixed school to hold 260 children. There are teachers' rooms in both the infants' and mixed schools. These rooms are in each case on a level with a dais, and by throwing back the folding doors this can be converted into a platform, to be used in connection with the central halls, when they are required for public meetings. The building is constructed of red brick, with moulded red brick facings on the front and sides, the back being perfectly plain, and the roof is covered with red tiles. The buildings were erected by Mr. T. T. Denny of Walmer, Kent, and Mr. Arthur Wells, F.R.I.B.A., was the architect. The heating arrangement and boiler were supplied by Messrs. Upfield and Sons, of High Street, Hastings. The amount of the contract for the erection of the buildings was £9,755, the total cost being £11,888.

Surveying and Sanitary Notes.

Streets Up in London.—The City of London Corporation have passed a resolution that works which entail interference with the main streets of the City shall be in future carried on continuously day and night until completed. The Engineer has been instructed accordingly in regard to future paving works in the City.

The Scientific Roll is the title of a new magazine of systematised notes of scientific bibliography on bacteria (schizomycetes) conducted by Mr. Alexander Ramsay. The first issue affords a ready means by which persons interested in bacteria may learn what has been published on any bacteriological topic. Frequently passages of considerable length will be taken verbatim, although generally summarised, and the general drift of the ideas given. In all cases the notes represent the authors' statements in their own language. Mr. R. L. Shailand, 38 Churchfield Road, Acton, London, W., is the publisher; the price is one shilling.

A Valuable South London Site.—The sale of the site and buildings of the Indigent Blind Schools, situated in St. George's Circus, S.E., has been completed. The consideration money, arranged by Mr. Reginald Roumieu, who acted as surveyor to the schools, was £140,000. The purchasers were the Baker Street and Waterloo Railway Company, who were represented by their surveyor, Mr. Leslie R. Vigers, of Frederick's Place, Old Jewry. During the construction of the new buildings for the schools on a site near the old church at Leatherhead, Surrey, only a portion of the existing buildings in the Lambeth Road will be utilised by the company, arrangements to that effect having been come to by the two surveyors engaged.

Great Sanitary Scheme at Fulham.—Next week the Fulham Borough Council will have in full operation one of the most important combined schemes of refuse destruction, electric lighting and disinfection undertaken by a local body in London. Under the existing system the cost of refuse removal by barges is 1s. 11d. per load, which, on an average yearly collection of 40,000 loads, amounts of £3,833. By means of the new destructor the cost, it is believed, will amount to only £2,358, showing a nett profit on the destructor of £1,775. By using the destructor in connection with the new electric lighting works the burning of the refuse will be equal to the consumption of 2,000 tons of coal, which, taken at 16s. a ton, shows a still further profit to this municipal undertaking of £1,600 a year, and a still further saving of £500 a year is estimated to be made by combining the disinfector with the destructor and electric lighting schemes. Allowing 5¼ per cent. as interest on the sinking fund, the estimated net profit on the combined scheme is put down at £2,728 per annum.

Keystones.

Burton Parish Church is to be restored at a cost of £3,500.

Memorial to the Late Dr. Martineau.—A movement is on foot to erect a memorial tablet in Little Portland Street Chapel to the memory of the late Dr. James Martineau, who for fourteen years exercised his London ministry in its pulpit.

A new Roman Catholic Cathedral at Leeds is to take the place of St. Anne's, and will occupy a site between the Masonic Hall and Cookridge Street. It is estimated that the cost of the cathedral, together with that of the presbytery, will be £33,000.

A Discovery of Mural Paintings has been made in the church of St. Peter at Louvain. The frescoes were discovered during the restoration of the church. They are of extreme delicacy, and may be classed amongst the most beautiful in the whole of Belgium.

A Roman Villa Unearthed.—Excavations for road-making close to the railway cutting on Rothley Temple estate, Lord Macaulay's birthplace, near Leicester, have resulted in the discovery of a Roman villa. A whole room has already been laid bare. The foundations are in perfect condition, and from the concrete floor spring several small pillars.

A Memorial to the late Rev. J. Russell Jackson, for thirty-three years vicar of Moulton, near Spalding, and for twenty-two years chairman of the South Holland Quarter Sessions, has been dedicated: it has cost nearly £600, and is in the form of a stained-glass window in Moulton Church and a restored chancel screen.

The Fine Arts Exhibition at Munich.—We are informed that applications will be received until May 1st, but objects of art for exhibition at Munich only between April 10th and May 1st. The architectural changes and adaptations of part of the Glass Palace are being pushed vigorously forward, and no doubt is felt that the exhibition will be complete in every respect on June 1st, the day of its opening.

The Church of All Hallows, North St Pancras, has been erected in one of the most crowded and rapidly growing parts of North-west London. The building was commenced twelve years ago, and was intended to be the permanent Church of the Good Shepherd, but when All Hallows, Thames Street, was pulled down, and the site sold, a portion of the proceeds was given to this church on condition that it was named after the one pulled down. The architect is Mr. James Brooks, and the style is severe Early English. The exterior is of Derbyshire rag and the interior of Portland stone. The cost of erecting the nave and side aisles has been about £17,000, and there is seating accommodation for twelve hundred. When the chancel is added there will be room for an additional three hundred seats.

A Covered Market at Dewsbury is to be erected at Crackenedge Lane.

Budapest and Austrian Builders. — The majority of leading actors and actresses in Budapest have pledged themselves not to accept an engagement in a theatre on which any Austrian architect, builder, decorator, painter, mason, or any kind of labourer had been employed, and a theatre built by the hated foreigners will be rigidly boycotted by nine-tenths of the population of Budapest. This is in consequence of negotiations having been conducted with a firm in Vienna regarding the proposed construction of a new national theatre.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held its usual meeting on Friday evening, January 25th, when Mr. John M. Arthur delivered his paper on "Legal Points for Architects." He divided his subject into two parts, namely: "The Legal Standing of the Architect" and "Legal Points relative to Buildings" leaving out the two subjects of Building By-laws and Conditions of Contract, as these had already been discussed by the Society. The legal standing of the architect in such matters as' "His position as Agent and Arbitrator," "Ordering materials on behalf of his Client," "Certificates," "Ownership of Drawings,' and "Fees," were fully gone into, and law cases bearing on each enunciated. Among his other headings were: "The liability for mishaps during Building," "Mutual Tables of Properties," "Drainage and Water Conveyance," 'Ancient Lights" and "New Charters."

Austrian Art Exhibition.—A committee of Vienna artists and tradesmen have resolved to make arrangements for a great Austrian art trade exhibition in London in 1902 or 1903, under the auspices of the Austrian Government.

"**Jacob Memorial.**"—It is proposed by many of the friends of the late Dr. Archibald H. Jacob, of Dublin, to raise a memorial in testimony of his life-long work in the interests of the profession. Subscriptions may be forwarded to Sir Charles Cameron, C.B, 51 Pembroke Road, Dublin, or L. H. Ormsby, Vice-President R.C.S., 92 Merrion Square West, Dublin, Hon. Treasurers, or to G. F. Blake; Registrar, Royal College of Surgeons, Stephen's Green West, Dublin.

The Autobiography of the late William Simpson, R.I, the prince of special artists in his day (as Archibald Forbes, his comrade in many campaigns, was among the newspaper correspondents) will be published in the spring, or summer, by Messrs. Morrison, the well-known Glasgow publishers. The autobiography was jotted down at odd moments during the last few years of the famous artist's life, not with a view to publication, but as a memento for his family. Mrs. Simpson has consented to the wish of many of her husband's admirers that the memoir should be published. Friends and correspondents of "Crimean Simpson" who may have any letters of his in their possession, or any documents that might be of use to the editor of the autobiography, should lend them, or copies, to Mrs. Simpson, at her address, 19 Church Road, Willesden.

The Ruskin Union.—The first annual meeting of the Ruskin Union will be held at 15 Grosvenor Crescent, Hyde Park Corner, on Friday, February 8th (Ruskin's birthday), at 8.30 p.m. Mr. Hardwick Bond will deliver a lecture on "Ruskin and Literature."

Labourers' Cottages in Mullingar.—A Local Government Board enquiry was recently held into an extensive scheme for the erection of new labourers cottages and the enlargement to one acre of half acre allotments attached to existing cottages in the Mullingar Union. The scheme deals with 270 cases, and the estimated cost of carrying it into effect is close on £20,000. It is proposed to erect about eighty new labourers' cottages and to enlarge the gardens of nearly 200 cottages already erected.

The British Fire Prevention Committee having had many enquiries reach their offices as to whether further important conflagrations abroad could not be made the subject of special publications or papers, in the same way as the Charity Bazaar Fire at Paris and the Horne Building Fire at Pittsburg, U.S.A., have already been dealt with, the executive have decided to issue authentic illustrated descriptions of the Comédie Français Fire at Paris and the Windsor Hotel Fire at New York, in respect to which valuable notes and photographs have for some time been in their possession. Both descriptions will be issued during the spring, and, as only a limited edition will be printed for members of the committee and the public authorities, non-members requiring copies should apply at once to the Assistant Secretary, 1 Waterloo Place, Pall Mall, S.W.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED
	BUILDING.		
Feb. 8	Constablee, Rawtenstall, Lancs.—Church	—	Austin and Paley, Architects, Lancaster.
" 8	Fernhurst, Sussex—Schoolroom	School Board	J. Hill, The Cross, Fernhurst.
" 8	Leeds—Stables, Coach House, Saddle Room, &c.	Dr. Sydney Rumbold	F. Mitchell, 9 Upper Fountaine Street, Leeds.

CONTRACTS OPEN.

WALTHAMSTOW PAROCHIAL CHARITIES.

TO BUILDERS, &c.

The Trustees of the above Charities are prepared to receive TENDERS for the ERECTION of FOUR SHOPS and OFFICE PREMISES upon a site situate at the corner of Wood Street and Wyatt's Lane, Walthamstow, the drawings and specifications for which may be seen at the Office of the Architect, Mr. W. A. LONGMORE, F.R.I.B.A., Bridge Chambers, Hoe Street, Walthamstow, on and after FEBRUARY 4th prox., between the hours of TEN a.m. and FOUR p.m, (except on Saturdays).

Tenders to be sent to the undersigned not later than FOUR p.m. on THURSDAY, the 28th FEBRUARY prox., sealed and endorsed "Tender for New Shops and Office."

The Trustees do not bind themselves to accept the lowest or any Tender.

GILBERT HOUGHTON,
Clerk to the Trustees.

Bridge Chambers,
No. 195 Hoe Street, Walthamstow,
January 1901.

N.B.—The conditions to be complied with as to the hours of labour and rates of wages can be seen at the Office of the Architect.

TO BUILDERS.

The Guardians of the Poor of the Parish of St. Giles, Camberwell, are prepared to receive TENDERS for the EXTENSION and COMPLETION of their INFIRMARY in Brunswick Square and Havil Street, Camberwell, to be executed from the designs of Mr. EDWIN T. HALL, F.R.I.B.A., Architect, 57 Moorgate Street, E.C.

Builders desirous of Tendering can obtain bills of quantities, prepared by Messrs. LEANING and SON, from the Architect upon paying a deposit of £10 10s., which deposit will be returned on receipt of a bonâ-fide Tender.

Drawings, specifications, &c., may be inspected at the Architect's offices after the quantities are sent out.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to enter into a bond with two approved sureties for the sum of £10,000, and will be required to pay the whole of his workmen engaged upon the works such rate of wages and observe such hours of labour as are recognised by the workmen's trade unions.

Tenders, addressed to the Board of Guardians, sealed and endorsed "Tender for Infirmary Extension, to be delivered to the undersigned not later than TWELVE o'clock noon on WEDNESDAY the 13th MARCH, 1901.

The Guardians do not bind themselves to accept the lowest or any Tender.

CHARLES S. STEVENS,
Clerk to the Guardians.

Guardians' Offices,
No. 29, Peckham Road, S.E.,
January 1901.

METROPOLITAN BOROUGH of SHOREDITCH.

The Council invite TENDERS for certain ALTERATIONS to the ROOF over the Reference Room of the Hoxton Public Library, Pitfield Street, N., including the provision of lantern lights over domes, and the covering of the whole flat with lead.

The drawings, specification and conditions of contract may be inspected, and form of Tender obtained at the office of Mr. J. RUST DIXON, A.M.Inst.C.E., Borough Engineer, Town Hall, Old Street, E.C., upon depositing the sum of 10s. 6d., which amount will be returned upon receipt of a bonâ fide Tender.

An approved surety must be given to enter into a bond of £250 as security for the Contract.

Trade union rate of wages and hours must be observed.

Sealed Tenders, upon the printed form supplied, endorsed "Library Roof," must be delivered at my Office by NOON on TUESDAY, the 19th FEBRUARY next.

The lowest or any Tender will not necessarily be accepted.

By order,
H. MANSFIELD ROBINSON,
Town Clerk.

Town Hall,
Old Street, E.C.,
January 1901.

Property and Land Sales.

SHORT NOTICE OF SALE.
To Architects, Builders, Show-case Manufacturers and others.
In consequence of the completion of the new permanent building for HORNIMAN'S MUSEUM, LONDON ROAD, FOREST HILL,

MR. HAROLD CARPMAEL has been instructed to SELL by AUCTION in the grounds of SURREY MOUNT at the rear of the Museum on FEBRUARY 13th, 1901, at TWELVE o'clock precisely :—

A substantially-erected GALVANISED IRON BUILDING about 100ft. by 30ft., match-boarded throughout with timber floor and joists, in excellent condition. An imposing iron Verandah with spiral staircase, two open heating stoves with cast-iron flues, TWO SELF-REGISTERING TURNSTILES by Norten and a ditto by Slark. A large number of well made and handsome SHOW CASES, CABINETS, SPECIMEN CASES and DRAWERS of all sizes and descriptions. Fifty glass shades and stands, &c. Also a small quantity of Builders' materials including scaffold poles and boards, putlogs, &c.

On view TUESDAY, February 12th, and morning of sale.

Catalogues may be obtained of the Auctioneer,
30A Lincoln's Inn Fields, W.C.

AT VERY MODERATE RESERVES WITH FREE CONVEYANCES.

WIMBLEDON.—Close to the beautiful Common, and within a mile of the Station on the South-Western and District Railways. THIRTY-FIVE Valuable FREEHOLD BUILDING SITES, with frontages to the fine, well-made important thoroughfares known as Burghley and Marryat Roads, forming a portion of the Wimbledon House Estate, the most beautifully situated building land available in the district, standing high, near to the Parish Church and picturesque Village, and close to the Common and Golf Links. The land has been divided into plots to meet the requirements of every class of purchaser, and is particularly suitable for the erection of high-class villa residences, for which there is an enormous demand, owing to the recent opening of the Electric Railway to the City and the increasing popularity of the neighbourhood. Free Conveyances. Tithe Free. Land Tax Redeemed.

HAMPTON AND SONS are instructed to offer the above SITES for SALE by AUCTION, at the Wimbledon Hill Hotel, Wimbledon, on SATURDAY, FEBRUARY 16th, 1901, at 2 o'clock precisely.

Full particulars, with Conditions of Sale and Sectional Plans, may be obtained from the Vendor's Solicitors, Messrs. HORNE and BIRKETT, 4 Lincoln's Inn Fields, W.C.; of the Architects to the Estate, Messrs. HUBBARD and MOORE, 85 Gresham Street, E.C.; and of the Auctioneers, Messrs. HAMPTON and SONS, Ltd., 1 Cockspur Street, Pall Mall, S.W., and at their Branch Office on the Estate, High Street, Wimbledon Common.

KNOCKHOLT, near SEVENOAKS.—Choice RESIDENTIAL FREEHOLD SITES within a few minutes' walk of the station.—For full particulars and price apply to FRANCIS DOD & Co., Land Agents, 59 High Street, Stoke Newington.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers: Part I.—Mr. J. Priestley, B.A., M.D., on "Sanitary Law," 7 p.m.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

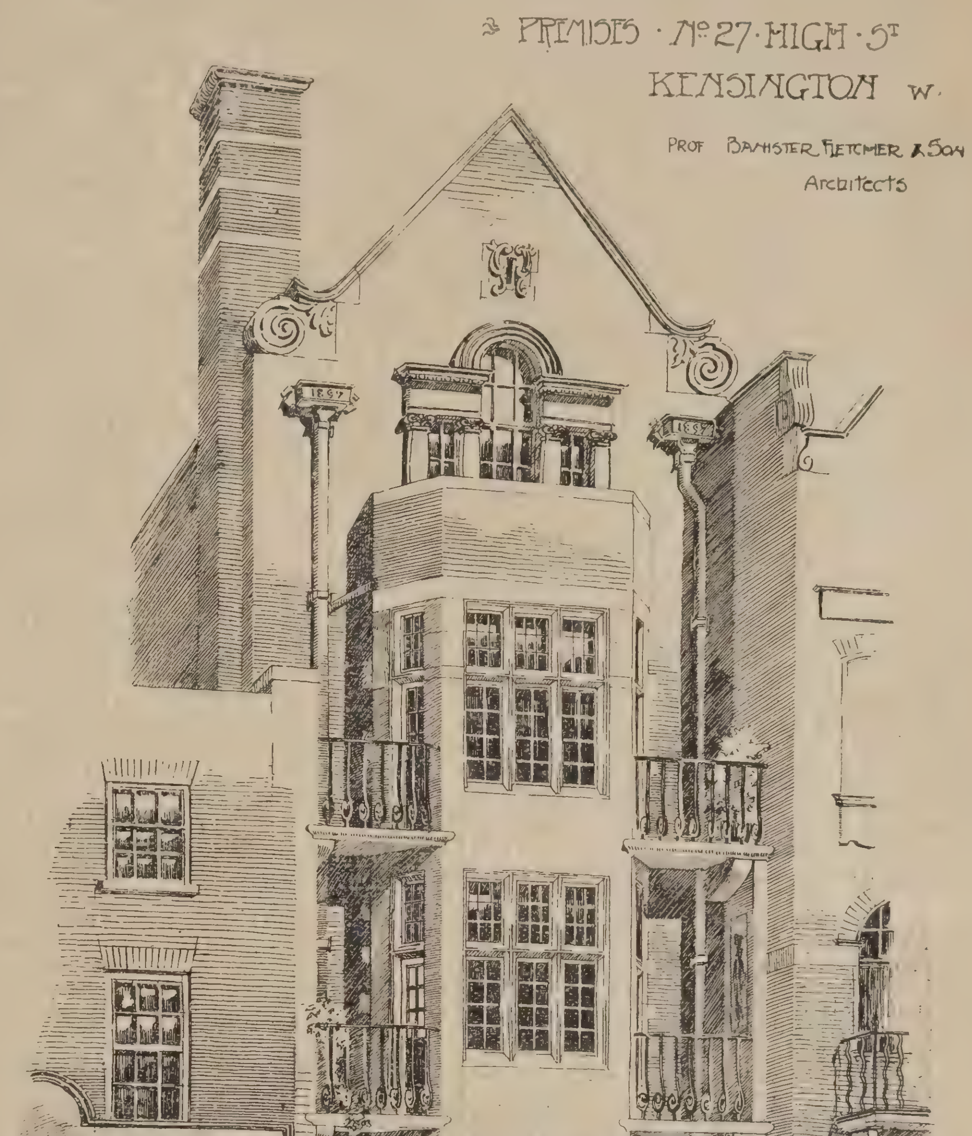
FEBRUARY 13, 1901.
No. CCCXIV.

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

Holborn-Strand Designs. THE London County Council are very reticent about the competition in connection with the new street to be formed from Holborn to the Strand, and it is most difficult to ascertain what they propose to do in the matter. It is now four months since the designs were on exhibition at the Royal Water-colour Society's gallery in Pall Mall, but the report of Mr. Norman Shaw is still withheld, though architects are anxious to know its recommendations. On December 18th the designs of Mr. Ernest Runtz for the new Gaiety Theatre and Restaurant (which will form the western end of the central block) were passed, and it was feared that the intention of securing a fine architectural scheme had thus been abandoned and that the work was going to be done piecemeal. Such a conclusion was the more probable as Mr. Runtz's design (No. 17) was not the most generally favoured in the competition. It is now stated, however, that the Council have decided to proceed with the scheme, and that the designs of Mr. Henry T. Hare, F.R.I.B.A. (No. 26), have been adopted. We have already published the whole eight designs submitted, and if our readers will refer to our issues for November 7th and 21st last they will at once see that the idea of combining these two designs, as submitted, is not likely to produce a satisfactory result. The amount of remodelling necessary would practically mean a new design. It is very desirable that the Council should make public their intention in regard to this scheme. Mr. Shaw's report should be published; we might then have an idea of what is proposed to be done, for it is assumed that the Council have observed his decision, not disregarded it as in the case of the recent Infirmary competition at Glasgow.

Tapestries. THE litigation which has arisen over the Luton Hoo tapestries affords a striking example of the difference of opinion on points of law which may exist even among the most eminent judges. The late Madame de Falbe left among her property ten valuable French tapestries in the mansion at Luton Hoo, and the dispute arose as to whether these were fixtures or personal chattels. Three of the tapestries were in the hall, and were enclosed in large oak frames attached to the walls by means of small brass and iron plates. A rule could be passed between them and the wall, and they were hung in the same way as heavy pictures or pier glasses. Mr. Justice Byrne had held in the lower court that these tapistries were not permanent additions to the house but were personal chattels, and it was only in respect of the remaining seven that the appeal was heard. These latter were in the drawing-room (they were said to be worth £7,000) and were fixed by being tacked to canvas which was itself stretched and nailed over strips of wood fixed to the walls. White and gold mouldings were also fixed round them. Mr. Justice Byrne thought that wallpapers and panelling could under no circumstances be taken away, and so held that these tapestries were similar fixtures. Lord Justice Rigby, however, said that if there was a paper on the wall which a tenant for life did not like he could remove it. He pointed out that time was when anything fixed to the freehold was held to go with the freehold, and it was only by slow degrees that that unbending rule was modified. But there were exceptions, one of which entitled a person who had put up fixtures for trade purposes to remove them. He therefore held that these tapestries were not fixed for enhancing the value of the freehold, but for purposes of ornamentation. The other learned Lords agreed with him, and so Mr. Justice Byrne's decision was reversed.



LONDON STREET ARCHITECTURE (*see page* 35).

G. BERTRAM BULMER, F.R.I.B.A.

MEN WHO BUILD.

No. 62.—G. BERTRAM BULMER, F.R.I.B.A.

In these days of startling originality and individualism it is exhilarating to see the work of an architect who is willing to follow the old traditions of architecture. Mr. G. B. Bulmer has very little sympathy with the modern "romantic" school, which, casting aside all precedent, attempts to form a new style of architecture with almost mushroom growth. Yet he disapproves the practice of the architect who follows—or rather copies—the old styles feature for feature and mould for mould, who cramps his accommodation in order that a certain part of the composition may be central, or places windows and other features where they are not required, so that they may form an elevation true to Palladio.

Mr. Bulmer was born in Leeds in 1851 at the Assembly Court, an interesting Georgian house formerly situated on the site of the present Corn Exchange, Kirkgate. He was educated privately and at the Leeds Grammar School, and was then articled to the firm of Messrs Perkin and Son, of Leeds; and he has been in partnership with the remaining member of the firm, Mr. Henry Perkin, F.R.I.B.A., since 1877. Mr. Bulmer has written several papers on professional subjects, both scientific and artistic, such as "Sanitation," "Wakefield Town Hall," "To Ancient Rome," &c.; he also edited "Historical Notes of the Baronial House of Bulmer," by W. Dickon Hoyle, published in 1896.

As a student he was a very prolific sketcher, and tramped the country with knapsack and measuring rod, making sketches and measured drawings of anything which he thought was worth delineating. The outcome of this was a book, which he published in 1887, entitled, "Architectural Studies in Yorkshire;" it consists of a selection of his sketches, drawn in a very vigorous manner, with a short description to each and a few of the main dimensions. This book has been a very valuable one to Yorkshire students, teaching them to study the characteristics of their own county, where they would probably begin to practise.

In addition, Mr. Bulmer is a very good painter in oil and water-colour. His great love of nature is seen in his studies of animals of all kinds—in fact, this is evident in his buildings, the motifs for the ornamented features, such as corbels and stops, &c., being almost always taken from the animal world. He has also drawn a good deal from the life, a study which affords a splendid tuition in proportion. Furniture and decoration have also been the subjects of extensive studies by him. The Leeds and Yorkshire Architectural Society has found a very enthusiastic worker in Mr. Bulmer, who was honorary secretary from 1883 to 1887 and president in 1892. He has also been for many years a working member of the Leeds Fine Arts Club, a private society for the cultivation of the fine arts.

Mr. Bulmer's method of design is very interesting and instructive. He makes a special point of not consulting the work of other architects, neither does he design in one style and then pass to another; but choosing one he develops it for each building he erects. This continuity of style is best evidenced in his design for the Yorkshire Penny Bank at Halifax, for which Messrs. Perkin and Bulmer gained the first premium in a competition; it is a bold treatment of domestic Gothic.

This was developed and used again in the bank at Sheffield for the same company, and reached its climax in their Central Bank at Leeds. The building suffers from its cramped situation, the narrow streets rendering it impossible to obtain a good view of it. This will shortly be remedied, however, as the street is to be widened to 77ft. The bank occupies an area of 1,315 sq. yds., with the principal frontage to Infirmary Street extending 103ft., and the office frontage to Toronto Street 115ft. At the angle of the building is a tower terminated by an open stage covered by a pyramidal turret. Inside the turret is a stone staircase and a lift, giving access to the two suites of offices on the first and second floors. The basement of the building contains cellars, clerks' rooms and other apartments, as well as the heating, ventilating and lifting apparatus.

The business of the bank is conducted on the ground floor, where there is a large banking room, two entrances to which are obtained from Infirmary Street, with ranges of windows on the front and in the rear. All the internal walls of this room are arcaded and the apartment is fitted up and furnished in oak in the same style as the building. On the same floor there are rooms for manager, clerks, inspectors, and other officials, and a large safe-room constructed according to modern principles. A large and handsomely-decorated room for the use of the Board of Directors also occupies a part of the same floor. The second floor is utilised for storage rooms. The building is erected entirely of Bradford stone, with red-tiled roofs. Throughout the floors are constructed of iron and concrete, and the materials generally used in the erection of the bank are as far as possible fireproof. The building, excluding the land, cost £60,000.

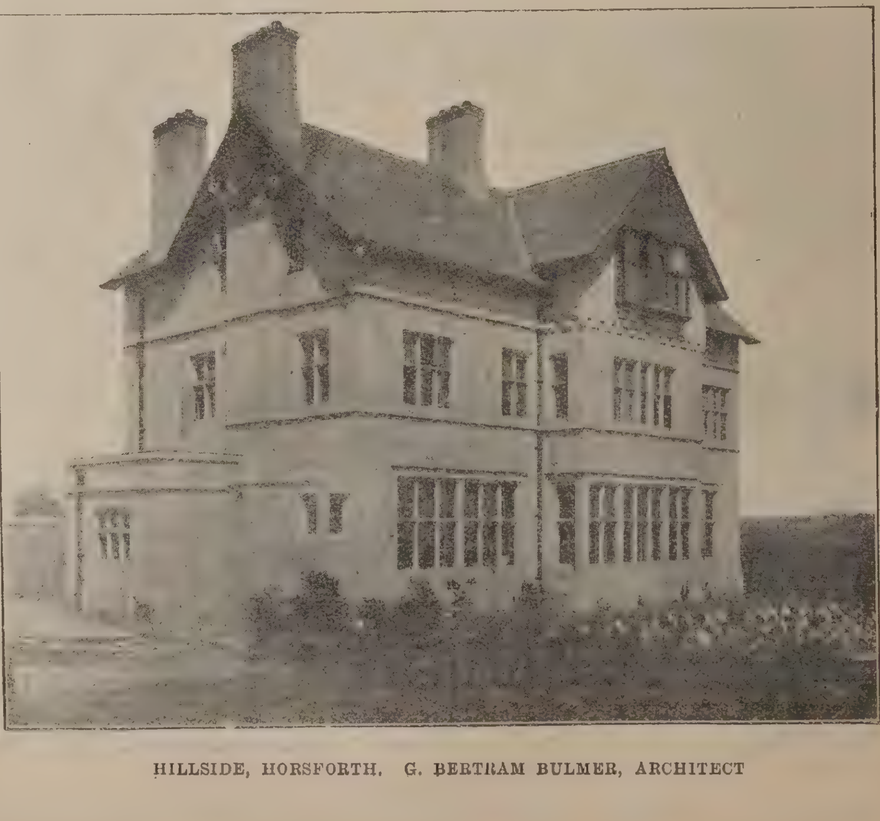
Mr. Bulmer has done a great amount of work in collaboration with his partner, Mr. Henry Perkin, in the county of Yorkshire. In the valley of the Wharfe especially one cannot enter a town or village without seeing some evidences of their work.

Between Menston and Burley is a well-designed lych gate in timber, with a roof-covering of red tiles, whilst in the village of Burley the Working Men's Club will at once proclaim its authorship by its vigorous treatment and characteristic detail.

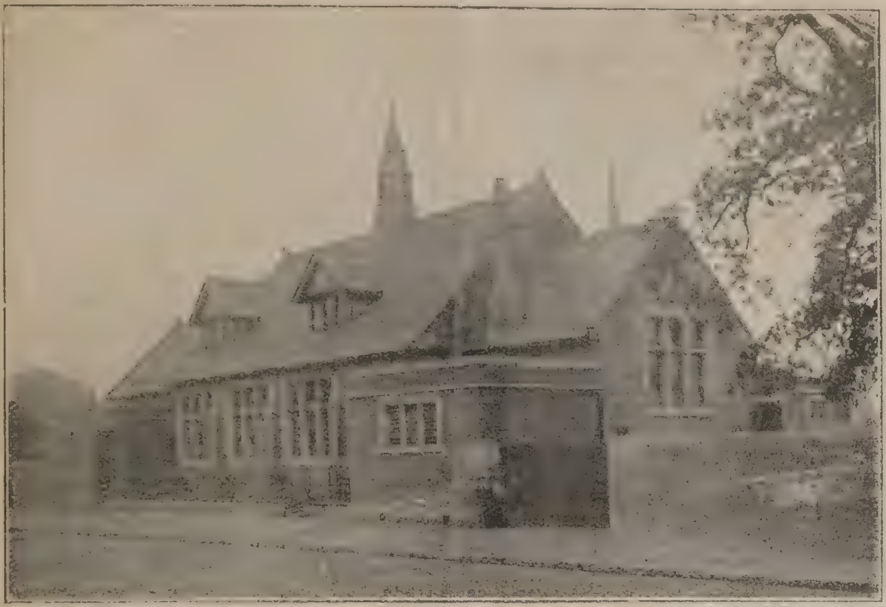
In the ancient town of Ilkley there are some buildings designed by Mr. Bulmer; a stone house for Mr. C. A. Rickards, now in course of erection, is the latest. This house occupies a very charming position on the Myddleton estate. It is on the north side of the river, and has a southern aspect. From the west windows there is a splendid view of the beautiful river Wharfe, winding away in the far distance. The building is designed to harmonise as much as possible with the surrounding country, which is of a wild nature, being mostly moorland. It is built of local stone and roofed with red tiles. The dining-room, halls, staircases and landings are finished in oak. The windows are glazed with leaded glass, and the hall, landing and principal rooms are heated by hot-water pipes in addition to open fires. The detail is truly Yorkshire in character, and the whole composition is evidently influenced by the simple yet dignified stone manor-houses of the county.

A large stone house at Horsforth for Mr. Stables was erected under the same influence, and with its bold detail and large expanses of wall surface makes a very fine composition. In Leeds the firm have erected the National Provincial Bank in Park Row, which was rather spoilt in its proportions by a right of light case. The lower storey is of polished grey granite, and is very simply treated; there are few mouldings and no ornament. The upper part is a free development of Renaissance in brick and stone.

The Buck Inn, at the corner of Kirkgate and Briggate, shops in Briggate, St. Chad's Schools, St. Cuthbert's Church, and a large warehouse in Wellington Street are a few of the other buildings in Leeds designed by Mr. Bulmer. Amongst other buildings by him are the town hall at Pontefract and the Courts at South Shields. Shipton Court, in Oxfordshire—a large Jacobean mansion—is now undergoing restoration under his supervision for F. W. Pepper, J.P.; the stone mullions to the windows are being reinstated



HILLSIDE, HORSFORTH. G. BERTRAM BULMER, ARCHITECT



ST. CHAD'S SCHOOLS, LEEDS. G. BERTRAM BULMER, ARCHITECT.

and the execrable sash windows taken out. The Ionic portico is being removed and replaced by a doorway more in character with the house. The principal rooms are to be panelled with oak wainscoting.

The accompanying illustrations serve to show the aims and methods which Mr. Bulmer observes in the execution of his work.

Views and Reviews.

A New System of Perspective.

School perspective is objected to by practical men because, although correct, it requires a multiplicity of lines for its use and architects' perspective is substituted for it as soon as the requirements of business call for a pictorial representation of a building Whether the author has succeeded in still further simplifying the necessary procedure is a question which is *primâ facie* open to considerable doubt, since he requires no fewer than seventeen plates to explain his method. He alleges that by the rule he proposes there is no need for either the plan or elevation of the object to be drawn, and that the whole operation can be worked out within the space of the paper or canvas if to the right and left of the canvas two laths be fixed at the height of the horizontal line, to carry those points to which certain given lines tend. The rule referred to does not seem to be capable of brief statement in words, but apparently consists in a method of working. The principle of the method is stated in the following paragraphs:—"The right angle contained by two lines drawn through the foot of the spectator in the horizontal plane, and which meet upon the vertical brought down from his eye, although invisible to him, would appear as a right angle, that is, if the direction of his glance is perpendicular to its plane—*i.e.* if the point of sight is situated on the natural horizon Wherefore if, in order to see it, he steps back without altering the direction of his eye, the angle takes a form apparently greater than the right angle; and the further he recedes the more the angle opens, till its two arms gradually coincide with the line of the horizon, both because of the distance and of his position. From this may be deduced that the greater or lesser apparent opening of the right angle is relative to the distance at which it is seen, and to its position with regard to the horizon. This angle can therefore be taken at pleasure in its apparent form, more or less open, and thus its two sides may be more or less inclined towards the horizon. From this apparent or perspective angle we shall, after fixing the height of the horizon and the direction of the eye or point of sight, find the distance, the diagonal point, two geometrical points and two vanishing points."

In connection with the first plate the author says, "Bisect the right angle G M H by the line M N, cutting G H at the point N. Take any point E on M N, and take any points A and B on the lines M G, M H equidistant from M." This reads like a description made up from a cursory inspection of the finished diagram, and does not tally with the evident mode of construction. It should be reversed, thus: "On the lines M G, M H take any points A and B equidistant from M, and from points A and B with a suitable radius describe arcs intersecting at E; from M draw a line through point E, cutting G H in point N; then M N will bisect the right angle G M H." This is not very hopeful in view of the long geometrical descriptions accompanying each plate. In describing the next one the centre of vision is called the point of sight, although it is more usual to apply this latter term to the position of the spectator. The author also calls what are usually known as the measuring points by the term "geometrical points," and the diagram of Plate 1 repeated on Plate 2 has now different lettering, which helps to confuse the mind in the endeavour to follow what the author has to put forward.

In Plate 4 the real idea becomes apparent: it is simply this, that instead of fixing the position and distance of the spectator with regard to the building we can draw in at pleasure two lines from the nearest angle of the perspective representing the base of the front and side of the building, and from this angle we can find the vanishing and measuring points which would make the assumed angle a correct perspective view; but *cui bono?* It surely is more satisfactory to an architect to choose the position and distance of the spectator than to commence his perspective by drawing the two base lines at an assumed angle.

After reading carefully through the book we are unable to discover any other advantage in

the proposed method. As a school exercise it may have some slight use, but we do not think any architect would trouble to follow the instructions. In the final plate a happy suggestion is made that upon any photograph of a building the horizon line, vanishing points, &c., can be drawn by making use of some of the lines of the picture, and reversing the process of constructing a perspective view the geometrical dimensions of height and breadth can be obtained. This may occasionally be useful.

SOCIETY OF ENGINEERS.

THE PRESIDENT ON HEATING AND VENTILATION.

THE first ordinary meeting of the Society of Engineers for the present year was held on February 4th, when Mr. Henry O'Connor, the president for 1900, occupied the chair. Among the premiums for papers read during that year, the president's gold medal was awarded to Mr. Henry C. H. Shenton for his paper on "Recent Practice in Sewage Disposal."

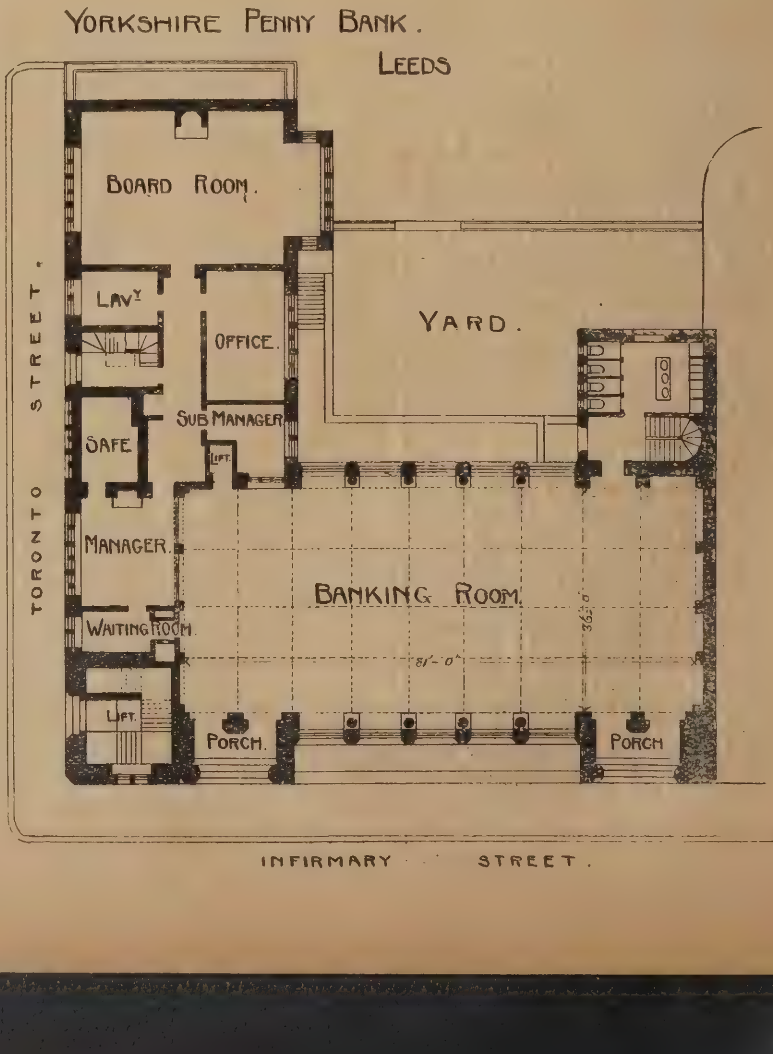
The president for the present year, Mr. Charles Mason, delivered an inaugural address. He first dwelt briefly on the marvellous progress made during the past century, but pointed out that engineers of the present day should not forget the skill and talent displayed generations ago in the construction of such monuments as the Pyramids, Stonehenge, and numerous Roman and other remains still in existence.

The practice of a municipal engineer was referred to, with special reference to work in large towns, including the repair and maintenance of sewers and pavements, and the construction of subways for accommodating the numerous pipes and wires laid beneath the street surfaces. Surprise was expressed that more headway had not been made with regard to the general adoption of a scheme of subways for London, the few now existing being frequently too small for the purposes they were intended to serve. An ideal subway was described by which the entire width of the street should be occupied, and the president observed that, although the cost and difficulties of construction would be great, if some scheme of rental, based upon the present expenses incurred in continually opening up and making good the street surfaces, were arrived at and devoted to payment of interest on capital, a good return would result.

The science of heating and ventilation was discussed with special reference to domestic heating and to the small extent to which well-known and efficient systems of heating had been adopted in private houses, old associations and cheap fuel being the prime causes for want of progress in the matter. The advantages and disadvantages of warming by steam, hot water and hot air were stated, the president pointing out that it was impossible to adopt the same principle for all buildings. Steam, he said, as a heating medium was not adapted for warming private houses, churches, or institutions where skilled labour was not permanently employed. In such buildings low-pressure hot-water formed a far better system, being more easily managed and not requiring such constant attention.

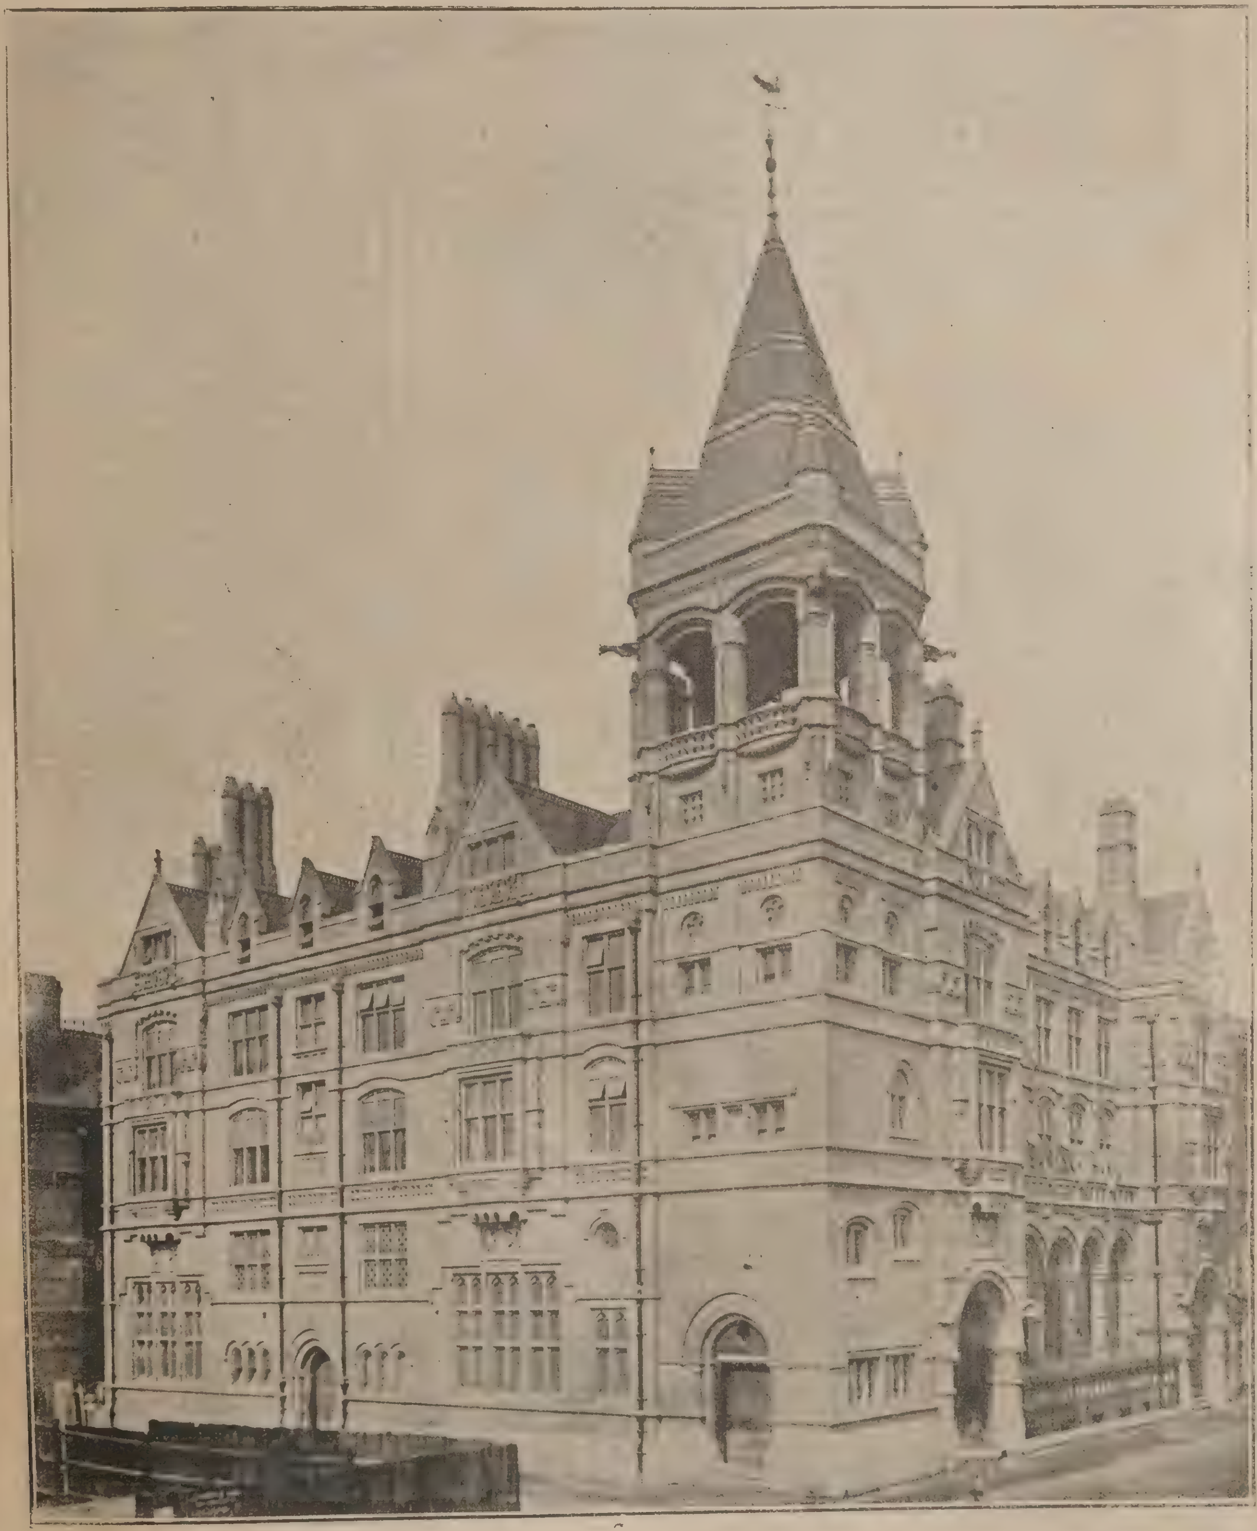
The inconvenience frequently experienced in designing an efficient apparatus from the want of reliable statistics, results of tests and formulæ for guidance, was pointed out. The difficulties of excluding air and water in a steam apparatus, the president observed, were great, and many attempts had been made to overcome them, but very often with only limited success. The formation of partial vacuum in the system combined with specially-constructed valves working automatically had, however, so far been successful in freeing the pipes and radiators from air and condensed water. In a low-pressure hot-water system any accumulation of air could be readily withdrawn by means of air valves, either automatic or otherwise, placed on the highest parts of the apparatus. The proportions between radiating surface, direct heating-surface of boilers, and grate area were then given, and the necessity of attending to the smallest details of construction was strongly emphasized if success was to be guaranteed, the circulation of hot water being very easily adversely affected. Heating by high-pressure hot-water and hot-air stoves was discouraged for domestic work.

The president concluded by briefly referring to ventilation as being closely allied to and dependent upon heating; the introduction of an ample supply of pure fresh air being the main consideration in arranging any system (whether natural or mechanical), without allowing such air to become overheated or to cause draughts on its admission into the apartment. Want of attention in the working of an apparatus after it had been installed was the chief cause of inefficient working. It was often the case that in a ventilating plant the air flues and inlets were seldom properly cleaned; and a thoroughly efficient heating apparatus might often be condemned through inattention to small details in management, such as regulating valves and cleaning flues, the engineer receiving the blame which should be bestowed on the caretaker.

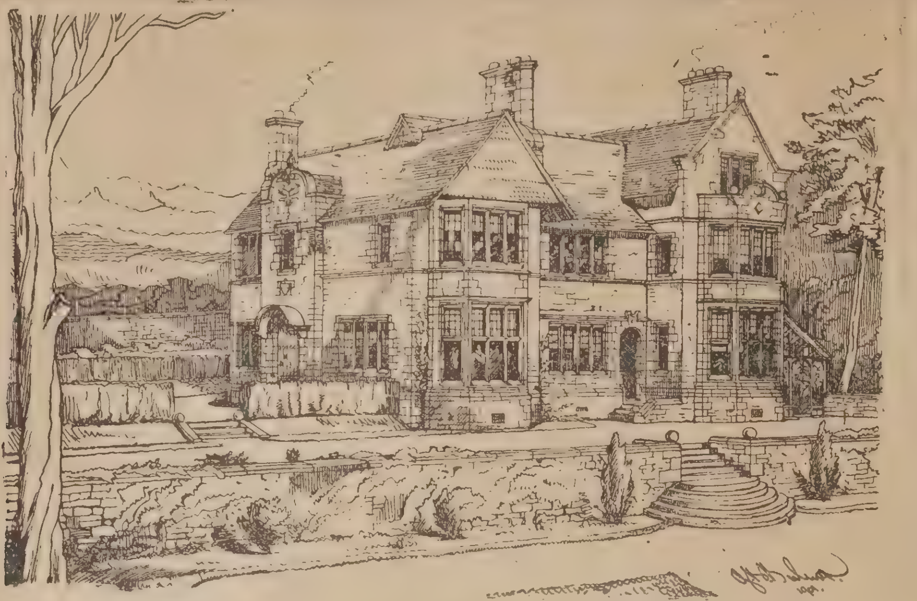


Law Cases.

Specific Performance of Building Contracts—The case of the *Mayor, &c., of Wolverhampton* v. *Emmons* came before the Court of Appeal on February 1st. This was an application by the defendant for judgment or a new trial in an action tried before Mr. Justice Wills and a special jury at Birmingham Assizes. The Court dismissed the application. The Master of the Rolls said that in this case the defendant, being minded to speculate in land and building, bought a piece of land in Wolverhampton from the Corporation. The indenture contained a covenant by the defendant that he would build on the piece of land a new building, or new buildings, within a certain period of time. The plaintiffs were desirous of having the land covered with buildings; but the defendant did not perform his obligation. He, however, obtained from them further time on making promises to carry out his contract. A correspondence took place, and by a letter of July 5th, 1899, the defendant undertook that, if further time were allowed him, he would build eight houses within two months. That letter, coupled with certain plans to which it referred, seemed to constitute a definite and unambiguous agreement. But still the defendant did not carry out his undertaking, and in March last the plaintiffs issued the writ in this action claiming specific performance and, in the alternative, damages. He thought that this was a case for specific performance. In his opinion, when there was a specific unambiguous agreement to erect a building and it was important to the person with whom the agreement was made, over and above mere money damages, that the agreement should be carried out, that was a case in which the Court of Chancery would have granted specific performance. If the party had contracted to build according to specific terms, it was not fair that he should be allowed to break his contract and then say that the other party should only get damages out of him. In his opinion, in the present case the loss arising to the plaintiffs from this land remaining vacant could not be estimated in damages, and he thought that the judgment of Mr. Justice Wills was right. Mr. Justice Wills made a decree for specific performance, saying that he gave the plaintiffs leave to make any amendment that might be necessary. Lord Justice Collins said he was of the same opinion as the Master of the Rolls. The houses which the defendant had contracted to build were specifically defined, and he thought it was made out that no adequate compensation in money could be made to the plaintiffs for non-performance. Lord Justice Romer said he had felt some doubts, but he agreed in thinking



YORKSHIRE PENNY BANK, LEEDS. G. BERTRAM BULMER, ARCHITECT.



HOUSE AT ILKLEY FOR MR. C. A. RICKARDS. G. BERTRAM BULMER, AHCHITECT.

that the judgment of Mr. Justice Wills ought not to be disturbed. He took it to be a general rule that the Court would not grant specific performance of a building contract. But there were certain recognised exceptions to that rule. For many years it had been held that plaintiffs seeking specific performance of a building contract brought themselves within the exceptions if they established, first that the building work was defined—that was to say, that the nature of it was so definitely ascertained that the Court might know what the work was; secondly, that they had a substantial interest in having the contract specifically performed, and that that was an interest which could not be adequately compensated by damages; and, thirdly, that the defendant had by reason of the contract obtained possession of the land on which the building was to be erected. His lordship then went through the facts of this case and showed that the three requisites above mentioned were satisfied, and came to the conclusion that the appeal must be dismissed.

Insurance of Workmen: Liability of Sub-Contractors.—At the Manchester Winter Assizes on February 5th the case of *Neill and Sons* v. *Hamor Lockwood* was heard. This was an action to recover damages for breach of contract. From the statements of counsel it appeared that in May, 1899, Messrs. Neill and Sons, builders, of Manchester, entered into a contract with the Lancashire and Yorkshire Railway Company for the construction of certain works, and they re-let a portion of asphalt work as a sub-contract to the defendant. The specifications and conditions attached to the sub-contract contained a clause to the effect that the defendant should include in his tender insurance of the workmen in his employ, it being a condition that the plaintiffs were not responsible for any accident occurring to the defendant's workmen. In the course of carrying out the work a man employed by the defendant was injured, and died. His widow made a claim under the Workmen's Compensation Act to which both the plaintiffs and the defendant were parties, and the case came before Judge Parry as arbitrator. The Court of Appeal had previously declared the law as to sub-contracts to be that a sub-contractor was not an "undertaker" within the Act, and was not liable to have a claim under the Act made against him; and Judge Parry, following this decision, awarded the widow £234 damages against Messrs. Neill and dismissed the application against the defendant Lockwood. The plaintiffs now sought to recover from the defendant this sum, together with £31, the amount of the costs in the arbitration. It was argued, on behalf of the plaintiffs, that the defendant was bound by the terms of his sub-contract to indemnify them against any claim for damages for injuries suffered by the defendant's workmen. On the other side it was urged that by taking out an insurance policy the defendant had performed any duty which was imposed upon him by the clause in question, and that there was no contract entered into to indemnify the plaintiffs against damages under an action that might be brought against them. The Judge said he was of opinion that the clause had been inserted for the protection of the plaintiffs with the object of throwing upon the defendant the obligation to discharge any claims which might be made by the defendant's workmen against the plaintiffs. He thought that the plaintiffs used sufficiently accurate words to express their intention. The defendant was to include in his tender provision for insuring his workmen—that was to say, he was to provide for the cost of effecting policies under which the claims of workmen in his employ might be met. He gave judgment for the plaintiffs for the amount claimed, with costs.

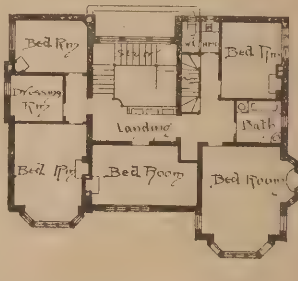
Quarry Notes.

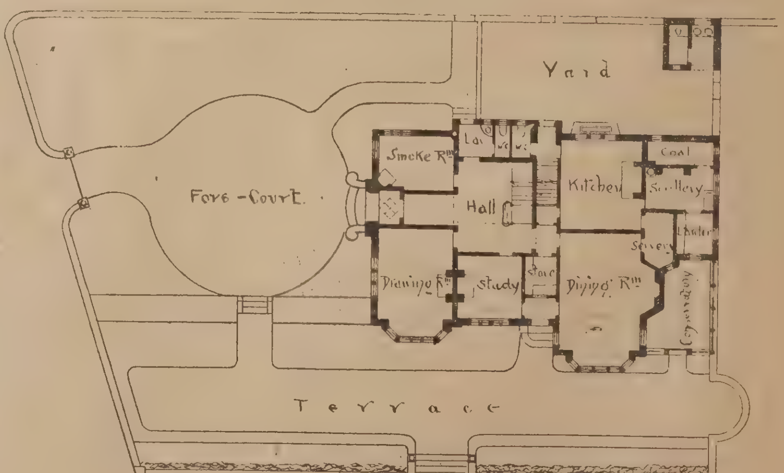
The Export of Slates at Carnarvon and Portmadoc has increased very slightly lately. The quarries at Festiniog, Nantlle, and Llanberis are full of workmen, and at the Port Dinorwic dock a brisk trade is being carried on. The employers feel satisfied that they have succeeded in their attempt to keep away foreign slates, and expect that at the beginning of March a change for the better will take place. This would mean that the prices will go up, and with them the men's wages. But the effect upon the slate trade generally would also be to result in foreign competition and the opening out of markets hitherto in the hands of Britain to America, France, Belgium, and Newfoundland.

Messrs. Burgess, Burgess and Company, of Abbey Mansions, 25 Victoria Street, Westminster, S.W., whose speciality is as agents for polished granite, dressed masonry, setts, macadam, granite adamant flags, steps, sills, &c., are acting as the London office of the Shap Granite and Patent Concrete Company, Limited, the Ceiriog Granite Company, Limited, and the North Wales Paving Company, Limited.

Swedish Stone Exporters have submitted an address to the Government as to the possibility of Germany charging kerbstone with so high a duty as to practically bring about a stoppage of the import. The Government is earnestly requested to make any efforts to avert the eventual dangerous result of such a measure on the part of the German authorities. A general stonecutter strike was declared on January 2nd at all quarries in the county of Blekinge, Southern Sweden.

The Aberdeen Masons' and Granite-Cutters' Union held a special joint meeting of the members of the local building and monumental branches of the trade last week in the Trades Hall, Belmont Street, Aberdeen. Mr. John Anderson, president, occupied the chair. The first question under discussion was a proposal by the Aberdeen monumental branch that the union should establish a trade paper. This was moved by Mr. Alex. Craig and seconded by Mr. George Younie. After considerable discussion, a vote was taken, with the result that 421 were in favour of the proposal and 15 against it. The next question was the payment of £50 to a member for total loss of sight of an eye, under the accident provident rules of the union. This rule provides that any member being disabled from following his employment by losing the sight of his eyes shall receive £50. The opinion of a section of the members was that the loss of the sight of one eye did not disable a man from following his trade. It was, however, thought by the meeting that such an accident was serious, and it was decided to remit the matter back to the Central Committee to consider what should be done to make provision for such cases.





HOUSE AT ILKLEY FOR MR. C. A. RICKARDS. G. BERTRAM BULMER, ARCHITECT.

Correspondence.

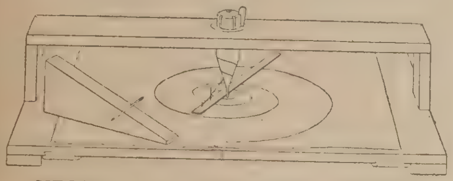
The Grecian Ionic Volute

To the Editor of THE BUILDERS' JOURNAL.

LONDON, S.E.

SIR,—Referring to the query about setting out the Grecian Ionian volute on page 477 of your issue for January 23rd, my answer to "P. H. E." would be as follows:—

Take a common whelk shell and clean it thoroughly, especially in the line of the spiral; then twist a string around it, tie a loop at the end, put a pencil through the loop, hold the shell firmly point downwards over a sheet of drawing paper, keep the pencil on the paper, and unwind the string; thus you will have a Greek volute.



METHOD OF DRAWING IONIC VOLUTE.

The above sketch shows how the spiral may be drawn with perfect accuracy by means of a straight-sided cone, but the shell is likely to give a more graceful curve.

As to Gwilt's (or Goldman's) method, anyone who appreciates Greek curves would never tolerate the broken-backed line so obtained.

In the old Greek spirals the deep centre hole held the cone not only to set out the curve for the mason but also to engrave the outline on the marble when he had finished; and this engraved line can be seen on the examples in the British Museum. The centre hole was afterwards made more shallow, then the cone was turned point down, and a very small hole was made to receive it, as in the Niké Apteros capital at Athens; finally the hole disappears altogether.

As to the proportions of the order (?), it is useful to have a general knowledge of the sizes of the different parts, but exact proportions are out of the question in view of the fact that the relation of the parts is different at different heights and in different surroundings; thus, the corner columns seen against the sky should be thicker than those seen against the darker building.

Do not forget the meaning of this wonderful composition: give the ovolo on the top of the column a good projection so that it may bear up the cushion which takes the weight of the entablature; and be sure to tuck the corners of your cushion (the volute) well under the projecting member. Above all, put brains into your work and make it live, then you will find the subtle principles of Greek (or Egyptian) design worthy of the hardest study, and yielding the most interesting results.—Yours truly,

DANIEL WOOD.
Author of "A Handbook of the Greek Method."

Cockington Church, Devon.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I desire to thank Mr. Harry Hems for his information respecting the font in this church, my description of which was certainly "a little misleading," although, as may be seen on referring to it, there was no statement to the effect that the whole of the font cover was original Perpendicular work. I did notice that the carving on the curved top was much cleaner cut, and that it seemed to be stained of a darker colour than that of the vertical portion; but, as I had no absolute proof of the fact of its having been recently made, and also because of its unity with and close resemblance in character to the rest of the cover, I refrained from expressing any views as to the probable date of its execution. But it is perhaps opportune to mention that the font is in almost the darkest part of the church. However, without any intention of flattering Mr. Hems, I may say that I am not at all sorry that I drew the font in its entirety as it stands to-day, not only because I understand that the greater part of it is original, but for the simple reason that I admire it, and that I appreciate good modern work (such as that in question) as well as those ancient forms and examples which furnish us with the material and basis for such work. Yours truly,

JOSIAS C. BEARE.

Lightning Conductors.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am agreeably surprised to find that Mr. Savery considers my previous letter too short. I confined myself to criticism of what I considered to be dangerous misconceptions, and purposely avoided any attempt to put the opposite side of the question, because it would be impossible in a space necessarily limited to do more than give a few general principles, and even then the explanations necessary to make them understood would have had to be omitted, so that probably the result would have been further misconception. An illustration of this is the report of the Lightning Rod Conference which was initiated by the Royal Meteorological Society and consisted of members of the leading learned societies, including the R.I.B.A. As the result of careful investigations, a report and set of rules were issued for the guidance of those interested in protection from lightning. These rules are in the main excellent, and did much to improve the bad practice which had previously existed even among those professionally engaged in the business, but I do not think they were ever intended to serve as a complete guide covering the subject from Alpha to Omega, or that anyone would consider that by reading those rules he could become an expert qualified to design a proper system of protection. It would be possible for conductors to be apparently in accordance with these rules and yet not be efficient, and it would require an expert to point out wherein the discrepancy lay. I did not intend to imply that Mr. Savery supposed that lightning was literally a fluid contained in a cloud, and I presumed that he used the word fluid in the same way as some of the older electricians did, as being a convenient term used only for want of a better; but I think the general tenor of the article implies that he had an idea that the only problem was to afford a sufficiently easy path for something stored up in a cloud. Most people regard the matter in this light.

For efficiency it is not the form or make of conductor which is necessary, but the personal knowledge which enables a man to take into due consideration a multiplicity of details (sometimes of the greatest importance, though easily overlooked) as to themselves, their relation to one another and to the proposed conductor, and so to arrange the system of defence that the building is left secure. A man who had the requisite knowledge could protect a building absolutely, using nothing but a coil of iron wire, some nails, a hammer and a spade, while one whose knowledge was confined to a set of rules would probably make a dismal failure when using the highest conductivity copper tape, elevation rods of the most approved type, and all the etceteras which are justly regarded as proper. As to how long the iron wire arrangement would remain efficient is another story. Even electricians do not generally plan their own system of protection. Appreciating the difficulties of the subject they prefer to rely on someone who has made it a special study. Even the late Professor Tyndall, whose name was closely connected with the subject, was no exception to this rule, but consulted a specialist for his own house and recommended one to his friends when they consulted him. I can hardly understand Mr. Savery's last remark. He surely does not regard lightning as wandering aimlessly about until it meets with a building to wreck or a conductor to go quietly down by. The discharge is, of course, between two oppositely charged planes—the earth and the cloud, and the path is all arranged beforehand by induction. What I meant to imply was (for instance), that, given a church tower with four pinnacles and a conductor on one only, lightning would not necessarily be attracted to the conductor, but would be liable to take one of the other pinnacles en route.—Yours truly, ALFRED HANDS.

Engineering Notes.

New York Elevated Railway.—The conversion of the New York Elevated Railway from steam to electric power will, it is expected, be completed by June next.

The new Electricity Station for East Ham is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Carnegie Sale.—A sale has been agreed upon in America by which the Carnegie Steel Company, the Federal Steel Company and other leading firms will be combined. The sale will be effected at £80,000,000.

Electric Light for Fulham.—To-day the Mayoress of Fulham (Mrs. E. A. Cornwall) will publicly switch on the electric light in this metropolitan borough. The generating station is combined with a refuse-destructor and a disinfector, and will entail an expenditure of £130,000.

Leicester Tramways.—The Leicester Town Council unanimously decided last week to purchase the undertaking of the Tramways Company and to work it under their statutory municipal powers, the present horse-power to be replaced by electric traction. Roughly estimated, the cost of the scheme is over half a million.

The Barrage of the Nile.—Sir John Aird and Sir Benjamin Baker are now returning to England, having completed their visit of inspection to the great engineering works at Assuan, where the immense dam to hold up the waters of the Nile is being constructed. The total extent of the dam is one mile and a quarter, of which one mile and an eighth of the foundation is finished. Unless anything unforeseen occurs, the reservoirs will be in operation for the Nile flood of 1903.

London Water Supply: Storage Cisterns.—A conference of the London County Council, the Corporation of London and the new Municipal Boroughs of the metropolis was held last week to consider the proposed new regulations of the water companies as to the supply of water to householders and others. Great objection was taken to the following regulation: "Every house (or in case of flats each suite of rooms) supplied by the company shall, except with the consent of the company in writing under the hand of their secretary, be provided with a cold-water storage cistern or cisterns of sufficient capacity to contain in the aggregate at least 25gal. of water for each room. Each outlet pipe from such cistern or cisterns shall be carried up inside 1in. above the bottom of the cistern, and such outlet pipe shall be commanded by an efficient screw-down stop valve, placed in a readily accessible position, within 1ft. of such cistern, and a draw-off tap from same shall be provided. In no case may there be any connection between the draw-off pipe from the cistern and the supply or communication pipe." Mr. Westacott pointed out that immediately the companies got the powers they asked for by this regulation they would only give an intermittent instead of a constant supply. Mr. Wood objected to cisterns, and the conference agreed to oppose the regulation with a view to its being struck out. The Council's report pointed out that it was the danger to health caused by the use of dirty cisterns, particularly in the houses of the poorer classes, that gave rise to the legislation of 1871, under which the whole of London (except a few places beyond the statutory limits) was now nominally provided with a constant supply. Other proposed regulations dealing with every form of water-supply were considered and generally opposed as being against the consumer and against the interests of the health of London.

Glasgow Royal Infirmary Competition.—The Executive Committee for the Reconstruction of the Glasgow Royal Infirmary have appointed a sub-committee "to formulate on behalf of the Executive a statement of the case from their point of view in order that the public may be accurately informed of the actual position of affairs."

Bricks and Mortar.

APHORISM FOR THE WEEK.

It is not possible for a man who follows many arts to do everything well.—XENOPHON.

Our Plates. THE measured drawings of St. John's Church, Westminster, gained for Mr. A. Wyatt Papworth a medal of merit and five guineas in the Royal Institute competition this year. This much-abused church stands in the centre of Smith's Square. It was begun in 1716 by Thomas Archer, a pupil of Vanbrugh's, and was one of the fifty churches proposed to be erected by Queen Anne. The cost was about £40,000, and the building operations occupied twelve years. Great objection has been taken to the four angle belfreys, but these formed no part of the original design—they were added in the hope of securing equal pressure upon the foundations, which, before the building was completed, had shown signs of settlement, owing to the swampy nature of the soil. The result was considered satisfactory. In 1741 the church was greatly damaged by fire, only the walls and towers remaining standing. Up to this time in front of each Corinthian pilaster internally stood a Corinthian column to match, supporting the ceiling and the entablature. But these were removed after the fire and the pilasters only remain. The roof, as may be seen from an old oil-painting in the vestry, was not originally of the present design, being a semi-circular barrel vault (plaster) running north and south, and lighted by the semi-circular opening (then glazed) in the pediments, which now stand up so meaninglessly above the roof at the backs of the porches. Another semi-circular roof ran east and west and the groined intersection of the two probably created a far handsomer effect than the present flat ceiling. The windows of the east end were glazed and not filled up as at present; the filling was not done until 1821, when the painted glass window, which came from an old church at Rouen, was inserted. In 1758 the galleries were added and in 1821 increased in size by William Inwood. The crypt of this church is constructed of massive brick barrel-vaulting, the walls in some cases being 6ft. thick. The intersections of the vaults are carefully worked in cut brick.

The Advice of Presidents. IN reviewing "Architectural Association Notes" for February in our issue for last week we stated that it contained "New Century Greetings" from the past presidents, and that we hoped to give some extracts in the present issue. This we are now able to do. The greeting from Mr. Thomas Blashill, the late superintending architect to the London County Council, is eminently characteristic of him. Mr. Blashill says:—"Your work is to design, estimate and superintend buildings. Stick well to that. Eschew gardening, pastoral staves, and hammering of pots, but know about flowers. Be easy with archæology. Study old work sufficiently, modern work incessantly. Study also workmen and tools. Form an opinion of every building new to you, and every published illustration. Account for such as please you, ponder wonderingly over the rest. Listen with discrimination. Pray against twaddlers, and stop your ears. (Have I not suffered fifty years under their droning!) . . . Be always trying your hand at design, of which plan is the root, elevation the flower. . . . You will do better than you expect; might found a School. How the critic would enjoy the scent of your heels!" Mr. T. Roger Smith gives students this advice: "Attach the first importance to the study of actual buildings on the spot." The same advice is given by Mr. Thomas Henry Watson, who says: "Good craftsmanship must in future depend upon the architect. For excellence of contrivance, materials and workmanship, let the student look to the best modern work while it is in progress, to all good work of former days when it is under repair." In Mr. John S. Quilter's opinion: "The basis of all true architecture is a thorough knowledge of construction. Study to make a building indicate the purpose for which it is intended, and do not sacrifice utility to appearance. Always secure the most convenient arrangement of all parts of a building before attempting to give it any architectural effect. Never destroy the sound construction of a building for the purpose of using some detail or ornament." Mr. Cole A. Adams says: "While you have the time, health, and the enthusiasm of youth, follow Burges's dictum, 'Measure and sketch, sketch and measure.'" Mr. Leonard Stokes says: "Let us therefore this new century resolve to be much more thorough in our work, and thus force our way into our proper place, *i.e.*, the top." "As to a word of advice to my fellow students," says Mr. Frank T. Baggallay, "I can only suggest that the practice of making clay models of buildings from sketch designs might lead us far towards a better appreciation of the true value of relief and mass." "Enthusiasm"—this, in Mr. Edward W. Mountford's opinion, "is the most important thing for the student to possess." Mr. W. D. Caröe says: "Study to regulate the prevalent go-as-you-please style of architecture."

Horniman's Museum. THE Museum at Forest Hill which Mr. Horniman has presented to the people of London (see page 34 of this issue), was designed by Mr. C. Harrison Townsend. Taking advan- of the declivity of the ground, the architect divided the building into two galleries of practically equal size, and the corridor arrangements permit a continuous circulation of visitors. The museum is buit of Doulting stone, similar to that employed in Wells Cathedral, and the design is striking and unusual. It occupies a superficial area of 16,485 sq. ft. The most prominent detail is, doubtless, the exterior decorative mosaic panel, 32ft. by 10ft., which occupies the whole length of the main façade, the figure being larger than life size. This is the work of Mr. R. Anning Bell and Mr. George Bridge, and it is an allegory of the course of human life in the spiritual and intellectual sense. It is interesting to note that the 117,000 small glass tesseræ contained in the design were put together almost exclusively by young women.

The Roman Wall. AT the meeting of the British Archæological Association held on January 30th (Dr. W. de Gray Birch, F.S.A., in the chair) Mr. R. W. Forster gave a very interesting lecture on the Roman Wall. After a short description of the situation and design of Hadrian's Wall and a brief statement of the questions concerning the wall and the earthen vallum, views were shown of the chief portions which still remain. The series began with the most easterly fragment of the wall, near Heddon, and this was followed by three views near Downhill in the neighbourhood of Corbridge, where the vallum makes a sudden bend and skirts the south side of the hill, while the wall keeps to the northern brow. At this point an ancient road has recently been discovered, cutting through the vallum, and it has been suggested that the road is Roman, and the vallum therefore of earlier date than the wall. Downhill, however, was extensively worked for limestone at an early date, and it is hardly possible to assign a definite date to many old roads and tracks which lead to it. Even if the road in question be Roman, the lecturer considered that fact did not prove what is alleged, for the Roman occupation lasted for nearly three centuries, and probably the vallum was not kept in repair after the province south of the barrier had settled down. Several views were shown of the remains at Cilurnum (the Chesters), including the flagstone pavement recently exposed in the forum, from which inscriptions may be possibly recovered if the lower sides of the stones are examined; also the larger eastern gateway, with the wall coming up to its southern side, showing that this gate as well as the north and main west gates opened on the northern side of the defences, possibly to enable cavalry to issue with greater speed from the fortress. Cilurnum was garrisoned by the second ala of Asturians. Views were shown of the large suburban building between Cilurnum and the North Tyne, which has been described as a bath or a temple, but was probably a villa. The largest chamber has a row of seven niches, which perhaps originally held statues representing the seven planets and the seven days of the week; in size and in appearance they resemble the niches of the reliefs discovered at Plumpton in 1813, which represent five of those deities (see Lapidarium Septentrionale, p. 411, No. 805). Another view showed the alcove opening out of the long chamber, with the lower part of its window, below which many fragments of glass were found. At the back of the villa is a space bounded by three walls and open behind, and it seems to have been roofed over; in one corner is a hatch or small window opening on the floor-level of one of the rooms within, and below this hatch the hypocaust is brought outside the building, forming a kind of table. It was suggested that this space was the kitchen of the villa, and that the hypocaust formed a kind of "hot plate" on which the dishes were placed before being passed through the hatch to the triclinium.

Borcovicum. A SERIES of views of Borcovicum were next shown, beginning with the gate in the valley on the east of the fort, formerly supposed to be a means of access to the so-called amphitheatre on the north of the wall. This however has recently been proved to be merely an old quarry, and the purpose of the gate was evidently strategic. Views of the east, west and north gates of the fortress were exhibited, as well as of the recently-excavated prætorium and the fine water tank in the south-east corner. Views of the Housesteads Mile-Castle, showing how the massive north gate was partially walled up during the latter part of the Roman occupation, and several views of the remains of the wall on the basalt hills beside the Northumbrian lakes, were shown. Attention was directed to the manner in which at the gaps in the line of hills the wall is drawn back so as to command both flanks of an attacking party, and also to the sudden changes of thickness which occur at many points. Dr. Bruce's theory that these show the places where the working parties joined up their sections seems insufficient. As a rule the insets go in pairs, forming a shallow recess in the south side of the wall, generally less than 1ft. deep and from 20ft. to 200ft. long, and in many cases the lowest course is not set back at all. Just east of the Housesteads Mile-Castle, the breadth of the wall changes seven times in 180ft. The series of views ended with that of the last fortress of which the name can be identified. In view of the forthcoming Congress at Newcastle-on-Tyne the lecture was much appreciated.

Workmen's Compensation: Mr. Ritchie's Letter. SOME time ago Mr. Edward Lovekin, of Kelsall, Chester, wrote to Mr. Ritchie, at the request of Mr. Chamberlain, asking whether it was the intention of the Government to remedy the difficulties attending the operation of the Workmen's Compensation Act in the ensuing session, and stating that it was considered scandalous that such an amount of litigation should attend the working of the Act. Mr. Ritchie replies "that it can hardly be considered immaterial that out of a measure making a new departure on a subject of great magnitude and complexity points of difficulty should have arisen, which have led to litigation. But many of the most important questions have now been settled by the decision of the authoritative courts, some of which show that several of the hostile criticisms passed at first on the effect of the Act were not well founded. Reference may be made in particular to two or three recent judgments of the House of Lords. Also it should not be forgotten that while the cases of litigation attract notice, the number of workmen who obtain the benefits of the Act without dispute is almost immeasurably greater." Mr. Ritchie is taking note of the points in which it may prove that the Act requires amendment, and all the questions which have arisen on it are receiving the very careful consideration of the Government, "but it is not possible to make any promise as to legislation next session."

THE PLANNING OF INEBRIATE REFORMATORIES.—II.

By GEORGE H. BIBBY.

(*Continued from page* 474, No. CCCXI.)

THE accompanying illustration shows the ground plan of an inebriate reformatory o which I referred in my previous article: it has been put forward by the Home Office, not as a model, but simply as a suggestion to be modified to meet the requirements of various districts. As I have already pointed out, it is most faulty in its details; yet the general arrangement of the blocks of buildings round a central courtyard shows a scheme that could be advantageously and easily applied, and the safe custody of the inmates thereby be adequately provided for without the necessity for very extensive and costly fences. The workshop accommodation, as shown, is not intended to provide for the requirements of the whole reformatory, but it has been suggested that some regular industry should be associated with each institution, and that a considerable number of the more tractable inmates be taken during working hours, under suitable supervision, to sheds or other suitable erections elsewhere specially erected and fitted and constructed purposely for the selected trade or occupation; but workshops as shown in connection with the main building, would be of great value in providing space for special occupation, according to the training and capacity of the patients, each inmate being, whenever possible, encouraged to follow his own calling; a course probably tending to the financial advantage of all concerned. As mentioned in my first article, a certain proportion of the inmates would probably be confined to the central courtyard or exercise ground and the main building, and for these workrooms would certainly be required.

I have already directed attention to the rather numerous defects of this plan, but, on the other hand, it is carefully designed to ndicate a minimum of outlets, and these could very easily be protected. The actual buildings for living accommodation form the greater portion of the boundary, thus avoiding the expense of additional walling, and at the same time presenting an unobjectionable and most effectual barrier against escape of the patients.

It has been admitted that some of the rooms might, with advantage, be somewhat increased n size: it would appear that too much attention has been directed to the question of the reduction of cost, and I am of opinion that there has been in this plan a reduction of the accommodation to a minimum which would mpair the efficiency of the institution very much.

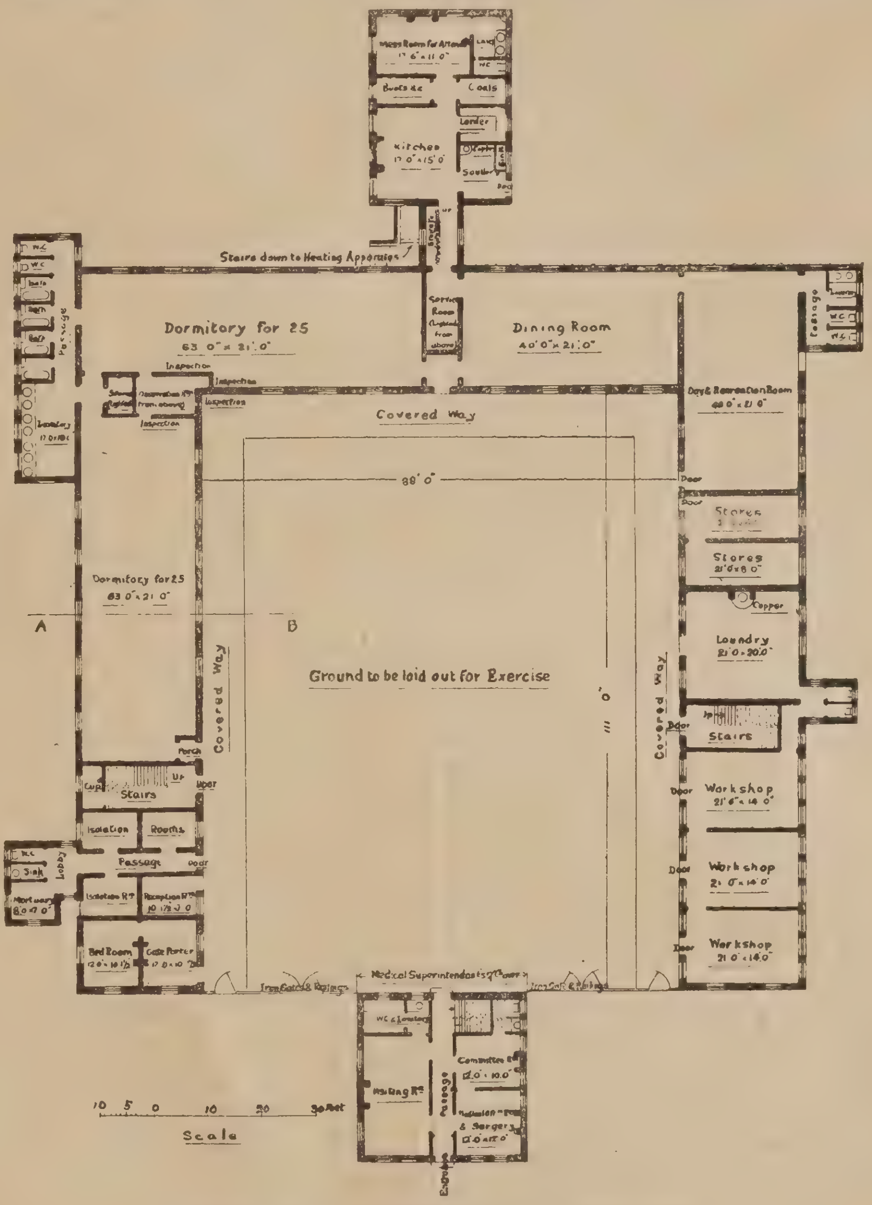
There is a considerable advantage gained by placing an observation room between two dormitories, as shown on the plan: by this means one night attendant would be sufficient o overlook the whole of the patients when in bed, and this attendant should have ample means of communicating with the superntendent and other officials should occasion arise during the night. From this observation room there would also be a view of the courtyard where the patients would be exercised; but the general arrangement of the dormitories and observation room might be greatly improved, as will be shown hereafter. Lavatories and sanitary requirements generally are placed outside the main walls, but this portion also equires considerable amendment.

A few isolation rooms are also provided, but ese are much too small, and should not be s, as regards area and cubical contents, than ould be required for an ordinary police-station ell: one room at least should be provided for nruly or unmanageable cases. I have in a ormer series of articles in this journal given ull particulars, plans and details of the construction, planning, doors and windows of olice cells, with numerous illustrations, and or some apartments in inebriate reformatories imilar construction and arrangement would be esirable.

All outside windows should consist of iron rames, with a restricted opening at the top for ventilation. Internal provision for work and exercise being provided, any patients unfit to be trusted amongst outside labour gangs can be wholly retained without damage to health and without entailing excessive supervision. Under this arrangement also, when work is done and patients are off duty they can be allowed to occupy the recreation room, or roam about the quadrangle at pleasure, engage in amusements, or otherwise employ themselves without constant watching, the superintendent being sufficiently assured of their safety.

All superfluous decoration should be avoided, both of the exterior and interior of the buildings, which, however, should be rendered as cheerful and attractive as due considerations of economy will permit.

The stairs should be built of stone, oak, teak, rock-maple, or of some other fire-resisting material, without winders or long straight flights, and with risers not more than 7½in. high and treads not more than 10in. wide; the well should be built up, or a newel wall provided, and handrails should be provided on each side of every flight and round the landings.



GROUND PLAN OF REFORMATORY FOR INEBRIATES.

The walls should be so constructed as to exclude damp effectually; wherever practicable, horizontal and vertical fire-resisting construction and materials should be adopted; the ceiling next below the roof in all parts of the reformatory occupied by patients should be constructed throughout of incombustible materials.

In all cases it is desirable to avoid descending or horizontal smoke flues; but when used they should be constructed with iron pipes enclosed in covered brick channels, and flues from any close fire or furnace which are carried up in any of the walls should be constructed with a hollow space round them, to prevent the inconvenient transmission of heat into the building during the warmer periods of the year.

Hydrants should be placed in convenient positions on all the floors, and external mains with hydrants provided by which water could be thrown over any portion of the building. It is often convenient to have the internal hydrants enclosed in cupboards large enough to contain the hose when attached to the hydrant and the nozzle.

All day and sleeping rooms should have wooden floors, and where boards are used they should be grooved and tongued; oak floors are preferable for the corridors and day-rooms and for isolation rooms for patients of a certain class; but where oak is not used it is advisable that the boards should be of the best yellow deal, pitch-pine, or rock maple, of narrow width and thoroughly well seasoned; all boarded floors should be prepared for dry rubbing; the floors of sculleries, lavatories, urinals and water-closets should be of terrazzo, cement, tiles, or other non-absorbent material; a layer of cement-concrete, not less than 4in. thick, should be laid under all boarded floors at the ground level. No timber inserted in any wall should be placed within 9in. of any smoke flue, and no plug should be driven within 6in. of the inside of any flue. The walls generally should be plastered or cemented internally; those of lavatories, bathrooms, w.c.'s, sculleries, laundries and kitchens should be lined to at least dado height with glazed bricks or tiles, and where the walls above are plastered it is an advantage to use adamantine plaster or Parian cement. No hollow or other mouldings likely to harbour dirt should be introduced.

To secure cross-ventilation, the windows of the larger apartments should be placed (where practicable) on both sides; the windows of the day-rooms and corridors should be of sufficient size and number, and bear due relation to the probable arrangement of the furniture and fittings; the lowest clear glass should not be more than 2ft. 6in. from the floor; the windows should have wooden sashes, double hung, and be made to open easily so as to allow a free circulation of air; the wall below the sills of windows in dormitories may be splayed, but in day-rooms it should be recessed to admit a seat, if required; in the dormitories and isolation rooms the windows may be placed with the bottom sill not more than 4ft. from the floor.

The condition of a certain proportion of the patients might possibly be such that, if not otherwise protected, the windows in all parts occupied by patients should be stopped so as to allow them to be opened top and bottom (not more than 5in.), the sashes being hung with hidden cord. These precautions, especially upon upper floors, might prevent delirious patients from attempting suicide, or from injuring themselves during the earlier periods of their detention, at which time they are more liable to outbreaks, as a result of their previous habits of intemperance.

Except for the fact that large dormitories enable the officials to obtain a good observation of a large number of the patients, it would for various reasons be desirable that there should not be more than six patients in each room (by placing the observation room between two such dormitories one official could be in charge of twelve patients); there should also be a fair proportion of isolation rooms for one patient each. The doors of all of these apartments should open outwards, and be so hung that when open they will fold back close to the wall. Those for rooms to be occupied by patients of an excitable or delirious temperament should be especially strong, and those for rooms occupied by patients who require to be closely watched should have an open panel 3½in. wide in the centre of the door, and so high above the middle rail that the occupant could not put his hand out far enough to reach the outside handle of the door. The locks for all such isolation rooms should be dead-locks, and contrived so as to open (when not doubly shot) by a handle on the outside.

All day-rooms and dormitories should have a sufficient number of open fireplaces, but additional means of warming, upon a suitable system, should also be provided for all large spaces for which open fireplaces would be insufficient, and also for the majority of the isolation rooms, and for lavatory and bathroom annexes.

Every part of the building must be thoroughly ventilated, not by artificial or costly mechanical appliances, but by some natural system, the fittings of which would not be likely to get out of order through any neglect of the officials or through damage caused by the interference of the patients. For this purpose Boyle's air-pump ventilators (combined with a suitable number of fresh-air inlets), of the right size, in suitable positions, and as arranged for by a specialist, would probably accomplish all that is desired at a moderate outlay. Experiments have been made with two or more systems of ventilation in combination; the results, so far as my experience informs me, have always been unsatisfactory on the grounds of costliness and want of efficiency, or on both of these accounts.

The w.c.'s should be of the wash-down pedestal type, with hinged hardwood seats, to lift up as urinals in all cases; each closet should be flushed by a separate flushing cistern (of the greatest capacity allowed or approved by the local authorities of the district). The pulls should be enclosed in tubes attached to the wall, or have concealed wires with flush slots; all pipes should be carefully cased in or protected, and all gas brackets or pendants and partitions between closets should be so constructed or fixed as to avoid facilities for suicide, the desire to commit which has frequently arisen as the result of mental depression following enforced confinement and the sudden withdrawal of intoxicants. For this reason it would be much safer that all lights, brackets and taps connected with gas should be safe from the interference of patients who might turn on the gas or break pipes for the purpose of procuring death by suffocation or by hanging themselves on the brackets, &c.

Means of flushing should be provided and the drains and sewers properly ventilated, and, especially, all waste-water pipes must be disconnected from the drains; soil pipes should be placed outside the walls and be thoroughly ventilated by equally large pipes carried above the roof, and they should deliver into properly ventilated chambers or manholes

Rainwater from the building should be collected in a tank or tanks, suitably placed, for the purposes of the wash-house and steam boilers, and the material used for pipes and cisterns should depend upon the quality of the water, as ascertained by analysis.

The enclosed airing or central court should be as spacious as practicable: it should be planted with trees and shrubs, and if there are any good trees already on the site an effort should be made to so arrange the plan that they may be preserved for shade. Seats and properly constructed sunshades should be provided.

As in the case of hospitals, asylums and workhouses, &c., it is very desirable that all water-closets, lavatories, &c, should be placed in projections or annexes, with a lobby not less than 4ft. 6in. wide, with cross-ventilation separating the apartments occupied by the inebriates from the water-closets. In addition to the baths in the wards in a large institution there should be general bathrooms or houses, conveniently placed and containing baths with good dressing-rooms attached. In the case of one or more bathrooms the bath should be placed in the centre of the room, with the foot to the wall, so that the attendants could bathe a refractory patient without great risk of injury to themselves or the patient. The baths should be of Stourbridge ware, and should not be enclosed in woodwork, but might have a hardwood capping; the top of the bath itself should not be more than 22in. from the floor. It is of great importance that the taps, as well as the supply and waste pipes, should be of large size, so as to allow a ready change of water for each patient, and further that the hot and cold water supply-taps should be plainly distinguishable. The openings for the supply and waste should be quite separate.

Provision should be made for separate bedrooms for attendants in connection with each pair of dormitories, each bedroom having an area of not less than about 100ft. superficial, and being provided with inspection windows looking into each dormitory; but the door of the bedroom should lead into a passage, not to a dormitory.

As a general rule it would probably be most advisable to place the general stores, workshops, laundry and similar offices at the north end of the buildings (the entrances to those portions being also at that part), it being arranged that there need not be more than one outer entrance to the steward's and workshop departments; this should be conveniently placed for control by the storekeeper or other responsible official.

The workshop department should include shops of ample size for carpenters, painters, plumbers and engineers, with a smithy adjoining—also a shed for bricklayers and masons; all opening on to the central courtyard and conveniently arranged for the delivery of materials. There should also be shops for upholsterers, tailors and cobblers. It would be convenient to associate with the cobbler's shop a central boot-cleaning room, where boots could be changed on the return from work on the land, and dried and examined for repairs.

The extent to which farm buildings should be provided depends upon whether the district to be served is, or is not, an agricultural one, but in most instances there should be accommodation for stock and some stabling for horses, with piggeries and fowl-houses, &c.

If an inebriates' reformatory could be arranged in two sections (for males and females), the laundry work for the whole establishment could be performed by the female inmates to their own advantage (as regards a suitable form of employment being provided for many of their number) and to the benefit of the institution from a financial point of view. In such a case well-arranged laundry buildings, with a sufficient drying ground, must be provided on the females' side of the reformatory. A separate washhouse for officers' and attendants' linen is desirable, and also, in large institutions, a separate washhouse for very foul linen. Appliances of the most efficient description for drying clothes should be provided, and a room with apparatus for washing and drying horsehair for beds would be found useful (if in connection with the upholsterer's shop). As will be perceived by comparing the above remarks with the accompanying plan, the arrangement proposed for a laundry in the Home Office scheme would be altogether inadequate.

Rooms of sufficient size for the reception of visitors, with lavatories and water-closets, should be provided in connection with inebriates' reformatories: these should be within a reasonable distance of the general entrance, and so placed that the visitors need not have to penetrate the inner portions of the premises more than necessary.

The staircases should be of such a number, and be so situated, as to afford ready means of exit to all patients in the event of fire or panic, and so as to enable the medical officer, attendants and others, to pass from one part of the premises to another without unnecessarily retracing their steps. Every dormitory should have two exits, and if on the upper floors these should lead to different staircases.

One or more suitable hospital or infirmary wards should be provided, containing a dormitory for a few associated patients, one or more rooms for isolated cases, a day-room, nurses' duty-room, with range, &c. If only to be on one floor, the ground floor is to be preferred for the purpose. Infectious cases would be best removed to a special public fever hospital, unless the inebriates' home should be planned on a large scale and for a great number of persons.

As in the case of county lunatic asylums, the day-room space for inebriates' reformatories may be provided either in the form of one or more rooms, or of a room or rooms combined with a gallery not less than 10ft. wide. In each case the floor space per patient should be at least 40ft. superficial. If provided by a room or rooms and gallery, the space afforded by the gallery portion must not exceed 20ft. superficial per patient. A convenient arrangement is a gallery of adequate width with a room or rooms at one or both ends. The windows of the gallery should, if possible, have a southern aspect.

The dormitories for associated clean and healthy patients should allow a floor space of 50ft. superficial to each bed or patient, and the rooms for isolated patients should contain 63 superficial feet, but the space in the dormitories and isolation rooms of the hospital wards should be at least one-third greater than these dimensions. The general height of each storey should not be less than 12ft. in the clear, from floor to ceiling; no associated dormitory should be for *less* than three patients.

In connection with each ward there should be a ward scullery, an ample lavatory, with basins in the proportion of one to every six patients (their wastes discharging into an open outside channel), a slop room containing a sink, storerooms for clothing, bedding, crockery, brushes and other articles for use in the wards, one or more baths and water-closets in the proportion of one for every ten patients, with an extra closet in each block for the separate use of the attendants; also a boot and hat room near the door leading to the grounds.

In all large inebriate reformatories it would perhaps be desirable that there should be a small ward in which newly-admitted patients could be placed under special observation, with a view to ascertaining if any peculiarities exist or if any particular course of action should be pursued with regard to their treatment. In all such reformatories one or more dormitories with a few isolation rooms communicating should be set apart and arranged for the care and supervision, during the night, by special night attendants, of unduly depressed or unnaturally excitable patients, who might develop dangerous mania with regard to themselves or others. As a certain proportion of those to be detained in inebriate reformatories is likely to be added to those already housed in asylums, as the result of intemperance, it is desirable that no precautions should be omitted with the view of providing against the dangers likely to arise from persons developing symptoms of insanity while detained in an inebriates' reformatory.

It may sometimes be advisable to build an inebriates' reformatory for a number of patients *less* than the maximum number to be ultimately accommodated; the institution should then be in the first instance designed for that maximum number, both as regards the administrative departments and the wards, and the buildings which are ultimately intended to be erected to complete the plan should be indicated in outline, if not fully, on the plans.

A general dining-hall for the patients, of ample size, conveniently situated with reference to the kitchen and capable of being used for purposes of recreation, should be provided; a day-room might be added, when necessary, by the removal of separation doors or shutters; a scullery and other requisite offices should be attached to the dining-hall; mess-rooms for the male and female attendants, capable of being used in the evening as sitting-rooms, may be provided in the smaller institutions, but larger establishments should be provided with distinct apartments for mess-room and sitting-room purposes. If the reformatory is to be a very large one, it would perhaps be well that the medical superintendent should have a detached residence within the grounds of the institution, which might, however, be connected with the main building by a covered or enclosed passage.

Suitable apartments may be required also for an assistant medical officer or officers, and for the steward, matron and chief attendants; if the employment of a married head male attendant is contemplated, a cottage in convenient proximity to the institution (and within the grounds) should be provided.

There should also be some sleeping accommodation for the domestic servants of the institution; in large reformatories it may be convenient to provide, in detached buildings, sleeping accommodation for some of the attendants, and also cottages for ordinary married attendants, should such be employed on the staff.

The chapel should be an annexe to the main building, and be connected therewith by a corridor, and most certainly be on the ground floor: it should have, as far as may be, the usual character of a church. To place the chapel and library on an upper floor, as arranged on the Home Office plan, appears to me to be a great mistake. The library especially should be on the ground floor in a very accessible position, with a good supply of amusing and instructive books, and not (as is occasionally the case) with almost exclusively theological works.

A mortuary, consisting of two apartments, and a post-mortem room, supplied with a washing-up sink, should be provided in a position easily accessible from (but as much as possible out of sight of) the reformatory buildings. For large institutions there should also be a waiting-room for patients' friends or for a coroner's jury, with proper lavatories, &c.

If a reformatory should be built on a very large scale for inebriates, it would then become advisable that there should be a small detached hospital for the isolation of patients suffering with infectious diseases: it should include a kitchen, small laundry and disinfecting rooms and apparatus; also accommodation for a caretaker and his wife, and for day and night attendants. The cubic spaces in such a building must not be less than 2,000ft. for each patient in the dormitory and isolation wards, and the general arrangements would correspond with some of those shown in those illustrations of fever hospitals that have frequently appeared in this journal.

(*To be concluded.*)

Professional Practice.

Aberdeen.—The plans for the new Greyfriars Church have been prepared by Mr. A Marshall Mackenzie, A.R.S A., and the work is now being proceeded with. The south elevation of the church faces Queen Street. The building has been designed in the English Perpendicular style, so as to harmonise with the general scheme of the University buildings. The main feature of the design is a large tower which forms the front of the church, and is in line with the front of the University block, with which it will be continuous. The tower, which, including the buttresses is 32ft. sq., rises to a height of 100ft., and is surmounted by a steeple 50ft high. The frontage to Broad Street consists entirely of the tower, on the south side of which is the gable of the aisle, recessed to the depth of the tower. The front elevation of the tower contains the principal arched entrance, which is in the centre of the tower in the front. The entrance is approached by a flight of steps, and is surmounted by a richly-moulded arch. The church consists of a nave and an aisle on the south side towards Queen Street. The aisle has a sloping roof, and is lighted by lancet-shaped windows of three principal lights, buttresses intervening between each pair of windows. The clerestory is lighted by square-shaped windows, each divided into three lights by vertical mullions. In the interior the nave, which is 40ft. high is separated from the aisle by a series of three arches resting on massive pillars. The interior is lighted by the clerestory windows combined with those of the aisle, while in the end wall of the chancel a place has been found in which to replace the south window of the old Greyfriars Church. The nave is divided by a central passage leading to the chancel at the east end. The pulpit is placed on the north side of the chancel, and behind it is the entrance to the minister's vestry. At the south-east corner is situated the organ chamber, and adjacent to it in the aisle are the choir stalls. A small gallery is inserted in the west end of the church over the vestibule. In the vestibule there is placed a church officer's room. The church is seated for 800. Below the church there is a hall and other necessary accommodation, entrance to which is obtained at the south-east corner of the building. The hall is lighted by square-shaped windows, room for which has been found by keeping the floor of the church well above the sloping line of the street. The hall is seated for 300 persons, and the other accommodation includes a session-room, a Guild-room, and a tea-room.

Blackpool.—A new Board school is being erected in the Devonshire Road district with accommodation for 1,000, the estimated cost of which is about £14,000 Messrs. Cardwell Bros. are the contractors. Mr. R. B. Mather is the architect, and Mr. C Place the clerk of works. The elevations of the school will be faced with Accrington brick. The main elevation is in Devonshire Road, and is more ornamental than the others. A special feature has been made in the central hall, which will have a central gable flanked by two gables on the north and south wings. The infants' and the juniors' departments are to be on the ground floor. There will be six class-rooms of the average size of 24ft. by 25ft., an infants' room 31ft. 6in. by 24ft., two separate cloak-rooms for juniors and infants 27ft. by 22ft., and mistresses' and teachers' rooms. There will also be a room for instruction in cookery at the girls' end of the building, with a separate entrance, cloak-room, and scullery attached, with store closets for books and utensils. The area of the central hall is to be 64ft. by 32ft. From the hall a view of all the class-rooms can be commanded, as there are to be glass screens all the way round. There will be large separate playgrounds for the boys and girls and infants, and in the girls' playground there is to be a detached building for laundry purposes. In the boys' playground there will be a joiners' workshop. In the yard there are to be verandahs, which will afford shelter to the children in wet weather, or when they arrive early. There will be cellars under the north end of the building for heating apparatus and storage purposes. The boys' entrance will be at the north end and the girls' at the south end of the building, their rooms being reached by four stone staircases. There are to be eight class-rooms, about the same size as those below, on the floor. The central hall will be the same size as the one underneath, and the masters' and the mistress's rooms will have command of the playground, as they project. The central hall on this floor will have an open principal roof, and the floors throughout will be wood block. The building will be heated throughout with hot water flow and return pipes, and radiators in the corridors on the low-pressure system.

Northampton.—A new Congregational Church was dedicated recently. The site has a frontage to Abington Avenue and abutting on Roe Road and Allen Road. Only part of the site has been built on at present, efforts being confined to the school-chapel which has been erected at the Roe Road corner of the site. Ground is left for a church, and in a few years the erection of a church will be taken in hand. For the present the school-chapel will meet the requirements of the neighbourhood. The buildings, which have been erected from the designs of Messrs. Charles Dorman and Son, 51 Abington Street, are planned with the principal entrance from Abington Avenue and a side entrance from Roe Road. On the ground-floor is the school-room, which is 44ft. 6in. long by 28ft. wide, with small class-rooms at one side and the infants' school-room, 28ft. 6in. long by 21ft. wide, with two class-rooms 10ft. by 10ft. On the first-floor is a large assembly hall, 50ft. 6in. by 40ft. 6in., with large well-lighted vestries and retiring rooms at the rear. This hall will for the present be used exclusively as a chapel. In the basement is a large kitchen, with the usual fittings, and also a store-room and heating chamber. Special attention has been paid to lighting and ventilation. Each room is well supplied with windows, which are large and spaced with regard to internal requirements, and supplied with opening casements for the admission of fresh air. The foul air is extracted through perforated panels in the ceilings, connected to a large ventilating duct in the roof by means of a powerful air-pump ventilator fixed on the ridge of the roof. The staircases are spacious and airy, the stairs are constructed of fireproof material, and there are numerous exits in case of emergency. The total cost has been about £3.500. Messrs. Wingrove and Stanley, of Northampton, were the builders.

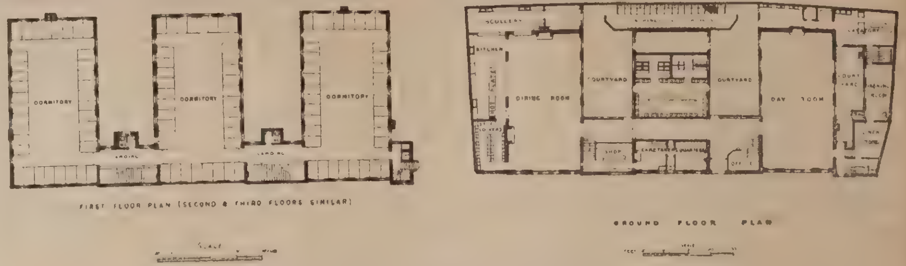
Wolverhampton.—At New Cross, Wednesfield, the Wolverhampton Guardians are building a new workhouse—a collection of buildings which, with the associated grounds, will cover a total area of some 50 acres, or an extent about equal to the Wolverhampton West Park. The total cost of this undertaking has been estimated at about £153,000. The erection of the new institution was commenced in March last. When completed the new workhouse will comprise 10 sections. Of these, the administrative section, which will comprise eight blocks, will form the main part, and the detached blocks will include the vagrant ward, mortuary, and farm buildings near the public thoroughfare. On the north side will be situated the workshops (with labour master's house). The nurses' home will not be far away. The medical officers' block will be fairly central, while away to the east ward (or the right-hand side looking from the public highway), will be situated the infirmary wards and other buildings. The workshops are tile-roofed; they comprise a range of shopping (with residence), and are built on the four sides of a quadrangle. The system of drainage consists of an underground tunnel connecting all parts of the institution, and in this tunnel all drainage pipes, gas pipes, water pipes and electric mains will be laid. The tunnel is large enough at all places for a workman to reach the mains, and he would, if necessary, be able to make a complete circuit of the entire buildings without coming to the ground. Thus any defect which may occur will be remedied without any cutting up of floorings, &c. Access to this passage will be, of course, obtained at various points. In the infirmary wards the male and female sides are so arranged as to be kept quite distinct, each being under the immediate sight of the superintendent, whose room is placed in a central position. The infirmary wards will comprise two storeys each, and there will be 24 beds in each ward, which will be twelve in number. Special attention has been given to the medical officer's block, which is almost completed, and the arrangements include all the apartments necessary for the medical officer, dispensary, kitchen, &c. The female infirmary is a replica of the male division. The isolation hospital will provide for four patients. There are laundry buildings, and a special nurses' home will have bay windows, a visitors' room, a garden, and tennis lawn. The house is built to accommodate a nursing staff of forty. The married couples (for sixteen couples) and nursery blocks, the workhouse blocks, and the apartments for mothers with children are also now being erected. The married quarters will also have a south verandah and balconies. The vagrants' ward will be provided with a laundry in the basement, and the farm buildings include piggeries, stables, fowl-house, barn, &c. The building of the Board-room at the workhouse, at an estimated cost of about £3,000, is to be proceeded with. The exterior materials being used are in general red bricks. Mr. Arthur Marshall, A.R.I.B.A., is the architect of the work.

LONDON HOUSING, 1855–1900.

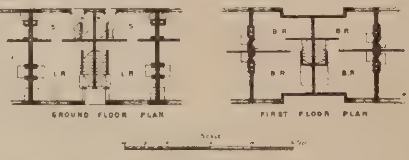
THE COUNCIL'S BOOK.

AN account of the housing work done by the Metropolitan Board of Works and the London County Council between the years 1855 and 1900 has recently been published in book form by the Council. It has been prepared under the direction of Mr C. J. Stewart (Clerk of the Council) by Mr. W. J. Russell and Mr. M. H Cox, LL.B. (Lond.), and is undoubtedly the most comprehensive book on this subject An important change in the policy in regard to the housing of the working classes took place with the institution of the London County Council in 1889, for they then decided to abandon the old method of the Metropolitan Board of Works—that of disposing of sites to companies for the erection of working-class houses—and to build, let, and maintain dwellings themselves To Mr. Stewart one of the clearest conclusions to be drawn from the investigations of the Royal Commission of 1884–85 is in connection with the activity of local sanitary authorities in making and enforcing the provisions of by-laws as to houses let as lodgings. Indeed he is convinced that the good effect of the work which the Council is now doing in providing working-class accommodation will be seriously impaired unless local sanitary authorities can be stimulated into enforcing the provisions of such by-laws so as to prevent the overcrowding of, and thus reduce the rents that can be asked for, the houses which, in the poorer parts of London, are let in tenements of one, two, or more rooms.

As is pointed out in the opening chapter of this book, until 1851 the Legislature did not concern itself with the quality and quantity of the working-class houses in the metropolis. It was then that the Earl of Shaftesbury (then Lord Ashley) drew attention to the disgraceful state of things, and as the result of his efforts two Acts (commonly known as Lord Shaftesbury's Acts) were passed—the Labouring Classes Lodging-houses Act and the Common Lodging-houses Act. The aim of the former was to increase the number of working-class houses by facilitating the establishment in populous districts of well-ordered lodging-houses, while the latter endeavoured to improve the quality of the dwellings. The Nuisances Removal Act of 1855 authorised a vestry or district board to take proceedings against overcrowding in a house occupied by more than one family, while further power was given by the Sanitary Act of that year. In 1868 was passed the first of the series of Acts known as "Torrens' Acts." It applied to individual houses, and its main principle was that "the responsibility of maintaining his houses in proper condition falls upon the owner, and that if he fails in his duty the law is justified in stepping in and compelling him to perform it." But the primary object seems to have been repair and patching up, rather than radical improvement. This Act was followed by the Artisans' and Labourers' Dwellings Improvement Act of 1875, which was the first of the series known as "Cross' Acts": it contemplated dealing with large insanitary areas, which were to be demolished or reconstructed. The Metropolitan Board of Works found, however, that the working of this Act was dilatory and costly; therefore it was amended (in 1879), though little good was effected. In the same year Torrens' Act of 1868 was also amended. But after these Acts had been in force for some years it was found that very little was being done under them, and in 1881 82 a Select Committee of the House of Commons sat to consider what further amendments could be made to stimulate action on the part of the authorities. The result of the Committee's report was the passing of the Artisans' Dwellings Act of 1882, to amend both Torrens' and Cross' Acts. Still it was felt that the progress being made was unsatisfactory, and a Royal Commission was appointed in 1884 to enquire into the whole matter. This resulted in the passing of the Housing of the Working Classes Act, 1885. Three years later the Local Government Act constituted the London County Council the authority in place of the Metropolitan Board of Works, and this marks the dawn of a new era. During 1889 the Council fully considered what improvements in the law were needed for the better housing of the working classes, and as the result of their representations to Parliament the consolidating Act known as the Housing of the Working Classes Act, 1890, was passed. It is divided into seven parts: the first is a consolidation (with amendments) of Cross' Acts; the second part is a similar consolidation of Torrens' Acts; the third part consolidates the Labouring Classes Lodging-houses Acts of 1851 and 1867; while the other parts deal with minor matters. After this we have the Public Health (London) Act of 1891, the London Building Acts, and the Housing of the Working Classes Act, 1894, which completes the legislation now in force in London in regard to housing. In carrying out their work the chief difficulties in building which the Council have to encounter are the high price of land, which leaves a very small margin to provide for interest and sinking fund upon the estimated cost of construction, and the increase in the price of labour and materials. "The combined effect of this rise in the cost of materials and rates of wages and the decrease in the number of bricks laid per diem has been to raise the price of brickwork per rod from £11 in 1890 to £20 15s. at the end of 1898." During 1889 and 1900 there were displaced 7,845 persons, 6,956 of whom were rehoused, while dwellings are in course of erection to accommodate 4,956; and 8,339 more will shortly be displaced, for whom additional dwellings will be erected.

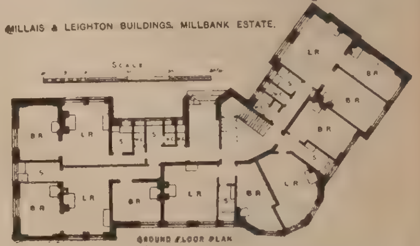


MEN'S LODGING HOUSE, PARKER STREET, DRURY LANE, W.C.



BROOK STREET COTTAGES, LIMEHOUSE.

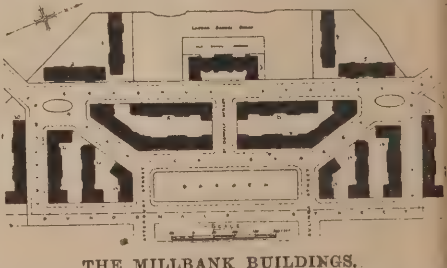
It is impossible now to go into any details of the numerous schemes which have been carried out or are still in progress; a great deal of such information has already been published in our columns; and it will only serve our purpose to state a few facts in regard to the accompanying plans.



In 1890 the Council decided by the application of Part III. of the Housing of the Working Classes Act, 1890, to build and manage a municipal lodging-house on a site in Parker Street, Drury Lane. They further decided to invite competitive designs, and those of Messrs. Gibson and Russell were accepted. The contract was secured by Messrs. Holloway Brothers, and the building was opened in January, 1893. Accommodation is provided for 324 men. The total cost amounted to £22,136, made up as follows: — Site, £3,750; cost of erection, £17,213; furniture, £1,172 The house is of fireproof construction throughout and has 324 separate cubicles.

By Section 3 of the Housing of the Working Classes Act, 1885, the Treasury was empowered, in the event of the Millbank Prison being demolished, to sell to the Metropolitan Board of Works a portion of the site for the erection of working-class dwellings. The Council approached the Treasury, and after some trouble the price of £2,500 an acre for about half the site was agreed upon. At the present time the Millbank estate is covered with a number of admirable buildings in red brick, which are named after various British artists. The following is a key to the accompanying plan:—1 and 2, Gainsborough Buildings; 3, Hogarth Buildings; 4 and 5 Reynolds, Buildings; 5 and 6, Romney Buildings; 7 and 9, Turner Buildings; 8, Rossetti Buildings; 10, Wilkie Buildings; 11, Lawrence Buildings; 12, Landseer Buildings; 13, Leighton Buildings; 14, Millais Buildings; 15, Mulready Buildings; 16, Maclise Buildings; 17, Horland Buildings. The Millais and Leighton Buildings were completed in 1898

Each of the cottages on the Brook Street area, Limehouse, consists of three rooms and a scullery. In all 306 persons will be accommodated. Of these cottages Mr. Chaplin said in the House of Commons that "in point of economy and accommodation they left very little to be desired."



THE MILLBANK BUILDINGS.

Anyone desiring to obtain full particulars of all the housing schemes carried out in London by the Metropolitan Board of Works and the County Council should consult this excellent book.

ARCHITECTURAL ASSOCIATION.

ARCHITECTURE IN CRETE AND TURKEY.

BY D. A. FYFE.

A MEETING of the Architectural Association was held on Friday evening last at 109 Conduit Street, Mr. W. Howard Seth-Smith, president, in the chair. The minutes of the previous meeting having been read and confirmed, Mr. Seth-Smith proposed a vote of condolence with the King and the Royal Family in their late bereavement. The motion was seconded by Mr. R. Elsey Smith and passed in silence, all the members standing. Mr. William A. Pite, senior vice-president, then took the chair on Mr. Seth-Smith having to leave. The following gentlemen were then elected members of the Association :—Messrs. A. F. Benjamin, W. J. Brough, B. A. Everitt, A. H. Fleuss, A. P. Lambert and E. A. Temple. Mr. D. A. Fyfe then read his paper on "Some Architecture in Crete and Turkey," which was illustrated by a number of photographs and drawings round the walls. The following is a summary of the paper :—

Like all Greek lands, Crete belongs to the dawn of history, and is rich in remains of that Mycenean civilisation, about which so little is known. This period, however, belongs more to the domain of archæology than of architecture, as also, in the case of Crete, do the Greek and Roman periods ; their remains being so scanty as to afford little architectural interest. After the decline of the Roman period the island was conquered by the Saracens in A.D. 820 ; then by the Byzantines in 961 ; but to Venice belongs the chief mediæval period, which lasted from 1204 till the final conquest by the Turks in 1669. The island in its most representative aspects is Venetian. Under the Turks how rebellion followed rebellion is matter of well-known history. It is certain that Crete held an important place in the Early Egean civilisation. Homer mentions it as a land of ninety cities, from which we can infer that it was highly populated. The sites of many of the Homeric cities have been identified, and are now partially disclosed, notably, Knossos, Gortyna, and Ghoulas. In their construction we notice the same characteristics which are displayed in the Palaces of Tiryns and Mycenæ, in the mainland of Greece, excavated by Schliemann and Dr. Dörpfeld, &c. In all are the same mud (or rubble and mud) walls, mysteriously appearing to be contemporary with Cyclopean masonry ; the same circular stone column-bases and paved areas. Only Knossos has produced some entirely new forms of architectural plan and detail, and such a collection of painted stucco, both existing on the walls and in fragments, as to make it quite unique in the Levant. Looking at this stucco as a means of decoration, it is noticeable that two distinct scales seem to have been employed. One, comparatively easy to appreciate now, consisting of life-size representations of figures, bulls, gryphons, etc., or conventional representations of landscape. The other consisting of very small objects or figures produced in a more brilliant style, and found in such small fragments as to make it hard to understand how it could have been used. From this latter variety some very interesting architectural representations are apparent, which help to elucidate the subject of Mycenean building. The art displayed at Knossos is the complete fruition of the genius of the time. Though some of the finds at Vaphio, in Greece, are quite as artistically mature, a comparison of Knossos with either Vaphio or Mycenæ is futile at present, as so much of the treasure of the latter comes from the tombs, which in the Cretan site have not as yet been discovered. But in the palace itself enough has already been found to show that in this reputed home of the art of Dedalus, a very keen, strong perception of natural forms existed, and a direct getting at nature behind an indefinable veil of conventionality, which gives the art of this epoch a distinct value of its own. In building, the outer walls, which may have been more or less fortifications, are based on ponderous squared blocks of gypsum, which weathers with water grooves, like the hard calcareous substance of a cave. The bases of many walls in limestone and gypsum have been found very accurately levelled and laid out, but it still remains a problem in many cases whether the superstructure was of the same substantial material or of mud to take stucco work. Nothing of direct evidence has been found to point to the existence of later Greek or Roman settlements over this primitive one of the palace at Knossos, though many Roman fragments exist in the vicinity. The site of Ghoulas is an Acropolis much more approaching the wild and inaccessible character of Mycenæ than the refined and civilised Knossos. Splendid polygonal masonry exists here, forming ramparts up a steep hillside which overlook a truly Greek prospect of hill and plain. And here also are picturesque evidences of a later Roman settlement on the Acropolis itself. But Crete has no prominent Roman architectural remains above ground that would bear comparison with those of Italy, Greece, and Asia Minor, and be of much help to the student in his search for the historic links which bind the Imperial Art to the Romanesque and Renaissance of later times. Coming to more modern times we notice also that Crete has passed through so many vicissitudes, and fire and sword have wrought in it such havoc, that its present day can show but little of permanent architectural value above ground. Whatever it was in early times, both under the Venetians and the Turks, it formed but an outpost station, very liable to attack ; so it is not surprising if the engineering of walls, and the useful side of architecture generally, form a large part of what is to be seen in the island to-day.

The more modern architectural remains of Crete include :—1. Churches and monasteries in a pseudo-Byzantine style, similar to those met with in the country districts of Greece. 2. Buildings of the early Venetian period, in which the pointed arch was employed. 3. Later Venetian buildings in a provincial Renaissance style. 4. Turkish buildings, which are mainly domestic, and in plain stucco. The town of Candia contains examples of all of these, except the first, though it has also been sadly deprived of much that was apparently interesting of the Venetian period. The great defence of Crete against the Turks in the seventeenth century was a matter of such interest to the Christian Powers of Europe that we fortunately possess some literature on the subject, and contemporary plans of the fortifications of Candia, the siege of which lasted for more than two years, and became one of the most memorable in history. Many of the original fortifications, especially on the north side, exist to the present day in a good state of preservation. The nature of the harbour has been taken advantage of much in the same way as at Rhodes ; and the fortifications of the two towns resemble one another, both being more irregular than those of Nicosia in Cyprus. The Candia walls are good examples of their class, but they have no prominent towers and no decorative details of interest, except the occasional panels with the Lion of St. Mark, and a few small carved coats of arms. So they are probably inferior in general interest to those at Famagusta, in Cyprus, and those at Rhodes. There are three principal gates in existence, all Renaissance of the Venetian period : the Canea Gate, the *Kainourio*, or "New" Gate, and the Lazaretto Gate. This last is probably the most interesting of the three, and has a long vaulted passage from the ornamental inner gate to the outer entrance. This passage is barrel-vaulted in rubble and descends fairly rapidly towards the outside. It turns sharply to the left at the end, so that there is an intersection, over which is a dome lit with a single eye : that when the outer gate was shut the passage would not be in darkness. The form of the inner gate, with its pediment, is quaint ; but the details are coarse and in no way improved by much whitewashing. The *Kainourio* is more commonplace than the Lazaretto, but is of naked stone, and has a good quiet cornice. It forms the entrance to the town from the interior of the island, and the present roadway really crosses what was the moat of mediæval times. It has also a long vaulted passage from inner to outer gate, though not so remarkable as the other. The Canea Gate has even less of architectural interest than the other two. It has no vaulted passage, being merely in the thickness of the wall, and it leads to the high road that runs eastwards along the north shore of the island, towards Retimo and Canea.

Leaving the walls and gates now, and entering the town by the harbour, we see first the remains of the great arches of Venetian Gothic which formed the arsenals of the mediæval town. They were, no doubt, complete before the great siege. Now, in their ruined state they are used as boat slips. The responds which exist on the back wall show that there must have been ribbed and groined vaults there, and the piers that exist are massive enough to show the large scale of the whole. Leaving the harbour, we pass up a sloping street to the centre of interest—the market square—at the highest part of the town. Streets radiate in all directions, but the interest here is diffused, and the square is only a quiet aside. The throng of the markets is at another meeting of streets a few yards from it, surrounded by low, squalid buildings, with here and there a crazy, whitewashed dome. The market square however, has a fine old Venetian fountain in the centre, surrounded by a Turkish marble and wrought-iron grille. The only large building in the town of any character is the old Venetian Renaissance armoury, now proposed to be renovated and used as a museum of antiquities. This building is a very good example of its period. The other Renaissance work in the town is fragmentary, but the Turks largely adopted details of the late Venetian occupation, which causes some confusion. The Gothic work in the town, or rather the "pointed arch" work, is in some cases even more difficult to analyse, as the Turks are always at home with the pointed arch, so that the Venetian Gothic and the Turkish work are not always readily distinguishable. Both of them probably have a Saracenic origin Venetian Gothic is certainly quite a unique flower in architecture, and perhaps belongs properly to the East, as the Turkish work undeniably does. There are one or two charming fragments of Venetian Gothic in the town, enough to show what might have been under a more fortunate dispensation. Here should be mentioned the only Gothic church in the town which is still standing. It is now used as a mosque. It has no pretensions whatever, being merely a barn-like structure, with high, narrow, pointed windows, all perfectly plain. It has a stumpy Turkish minaret of pleasantly original design. This mosque is illustrated in Pashley's "Travels in Crete." The wall fountain in the little square beside this mosque is the only example I know in Candia of Roman work being built into a wall by later hands, which is so commonly seen and so often charmingly effective in Rome and Constantinople. Of Turkish work one of the best old fragments is the series of arches in the main street leading up from the harbour. It much resembles the boat-slips at the harbour, but has one or two tricks of Turkish detail. The Turkish fountains are mostly at the corners of the streets, and, generally speaking, are hardly worth taking note of ; but in one or two cases the simplicity of the mouldings deserve attention. Turkish work, when it redoubles on itself without other influences, has a tendency to over-elaboration, and most of the great show fountains of Constantinople are glorified grottoes in their total effect ; so that it is refreshing to come across some things in this little provincial town which, either from poverty of workmanship or uncertainty of style, are simpler and broader in treatment. In the narrow winding streets one sees Turkish wooden houses with latticed windows, usually with a good projecting cornice and pilasters, and the upper storey projected two or three feet and supported on wood brackets. In the high walls giving access to the forecourts of the stone houses one sees here and there a Renaissance door and window, with occasionally a wall fountain, a trough surmounted by a round-arched niche and accessories being the usual motive. The wood houses are pretty much the same as those in the streets of Stamboul, and remind one a little of English half-timbered work, gables of course being absent, and a thin, matchboardy effect taking the place of the solid oak of the English. I have reserved the mention of the earliest work of all, the Byzantine, till the last; but there is really no definite building in this style that I am aware of existing in Candia. There is not a recent building of any note whatever, except perhaps the Greek cathedral, and not a single mosque which is worth enlarging on. The best mosque in the town is the plain old building mentioned before as the only Gothic church existing; but here, beyond a picturesque, weather-beaten, brick-and-stucco wall, there is nothing to be noted. The modern Greek cathedral is best seen at a distance, and gives additional life to the sea-view of the town. One can pretty well take in the town after a walk through, and appreciate what it is—tawdry, neglected, mediæval Eastern—shortly to become more important, perhaps, through a museum which consists of valuable exhibits with no proper building to hold them; which is part of the fact that many people have ideas about reform in Crete, but as yet very little money or unanimity of opinion have been forthcoming to carry them out.

But, leaving Candia and the burden of Crete meanwhile, let us turn our attention to other parts of the island, and see what is to be found in the way of architecture. And if the result is disappointing, we can remember that archæologically, at least, the ancient evidences are of immense value. The results of Knossos, Praesos, Sortyna, Gnoulas, &c., and the sundry caves of Zeus are giving Crete a research interest quite exceeding expectations. Architecturally, however, it has no town with a strong mediæval interest, like Rhodes, and no body of work such as is disclosed to us in M. Enlart's new book on Cyprus. The results for Crete are in comparison meagre and fragmentary; here and there a small Byzantine church or a picturesque monastery, and for the rest, merely the plain domestic work met with in the country districts of any Eastern land. It is true that there are two other towns of importance on the north coast—Canea and Retimo—Canea being really the modern capital of the island; and I have not examined these towns as I have Candia, but anything really important would naturally be found at the latter place. The growth of Canea is due to the adjacent harbour of Suda, by far the best in Crete. and its prestige is only on the modern side. It is the residential town of the High Commissioner, and, like Retimo, a commercial centre. It would be necessary, therefore, to thoroughly explore the country districts to arrive at a complete knowledge of all the smaller Cretan work. As the architectural bits are so fragmentary, and native evidence so little to be depended on, this would mean a tour of several months' duration. The Italians are said to be working up the architecture of Crete now, but I am not certain how thoroughly for the country districts.

The houses of the Turkish beys are the only ones left to us of any importance. They are usually farm-steadings in themselves, but the houses of retainers are sometimes grouped in a tiny village near. I can briefly illustrate the better class of house by the one I have most acquaintance with—the headquarters of the excavation at Knossos. The front entrance is quite a private one, and leads to the little piazza reserved for the household. The real entrance is at the back, through a courtyard, and leading out of this yard, round which are grouped the stables, is a smaller one descending to the kitchen apartments and entrance to the harem. The *selamlik* looks out to the front, as do the other principal rooms. All have stone wall fountains, which cool the air in summer, and a divan, or at least a platform, round three sides. Glass is a luxury, but hinged wood shutters opening outwards are indispensable. Joined on to the house, beside the little piazza in front, is a large water tank, forming a reservoir for the irrigation of the garden. This tank is not conducive to health in summer time. The house is all whitewashed externally, and is very sensibly plain, with a square parapet to the flat mud or cement roof. The rain water is carried off by channels running down the wall, which in the front of the house are screened by pilasters. The ceilings are of wood; stout exposed rafters carrying boarding. As for the villages, the small out-of-the-way ones have the merest shanties, with rough stone whitewashed walls and flat mud roofs, huddled together in picturesque style. The hill villages in summer are pleasant, as one half lives on the roof. The larger villages have whitewashed houses, the more important ones with courtyards opening off the streets, and sometimes of two storeys, as in Candia Red tiled gabled roofs are also occasionally met with, though they are really modern features.

The next thing to consider is the Byzantine church. This is often in splendid isolation, sometimes on a hill-top, and occasionally even on mountain summits. But every village has its *ecclesia*; at feasts, such as Easter, a very important place indeed. The universal plan is an oblong hall, without a narthex, and with but one feature—the tiny apsidal projection at the east end, finishing semi-dome fashion. In this apse is the only fancy window; in common cases, usually a queer little two-light, with the luxury of a hood-mould. The better class of church has a carved door, or painting in the plastered vault. The wood doors of these churches are sometimes elaborately carved. The usual type is a two-leaved square door, with a rounded centre-post, on which most of the carving is lavished. Many of these wood carvings are so undoubtedly executed in the full tradition of good work, that it is astonishing to find they mostly belong to this century; in some cases being done within the last thirty years. So tradition is dying hard in Crete.

Following naturally from this, of course, is the subject of the monasteries, as they always have chapels attached. The situation of monasteries here, as elsewhere in the Levant, is often very delightful. One rides up a ringing stony pathway to a sense of summit and retirement, and a clean spacious comfort which is a relief to the wayfarer after the squalid village. They are usually more subjects for the sketcher than for the architect in his more practical moods, but the monastery at Arkadhi shows a front of considerable interest, with that quaintness of combined Gothic-Classic influence so instructive often in unhackneyed forms. Unfortunately, I have reason to believe that this is one of the only things of its kind in Crete. The country is not rich in monastery work. These buildings tell by their grouping, but have no particular architectural qualities, strictly speaking.

The second part of this paper, dealing with some Turkish work at Broussa, follows somewhat naturally from the first; as after an examination of the mosques at Constantinople, one feels, as in Crete, the readiness of the Turk to adopt the indigenous architectural forms in the territories of his conquests. The work of the Osmanlis at Broussa, however, is earlier and more representative than any found at Constantinople, and holds an isolated position in Turkish art, somewhat similar to the Cinque-Cento in the history of the Italian Renaissance. The intricacy in the developments of Eastern work is manifold, but in the vast web of Saracenic styles the growth of what might be called the Renaissance of Turkish architecture is at least clear and distinct. The beginnings are to be found in Asia Minor, in those large and suggestive and often very beautiful remains of the Seljouk domination. It may be said that this pointed work of the Seljouks bear most affinity to Persian work, on which, so far as I know, it was directly founded. The work about which I wish to speak begins with the era of the Broussa Sultans, when Mourad, Bayezid and Mohammed—all first of the name—built the chief mosques of Broussa. Founded, as it was, on what the Seljouks had done before, this work seems to have, in addition, some large and common-sense individualities. The typical two-dome plan, which, Texier observes, is not found at Constantinople at all, is best seen here in the Mosque of Mourad II., the Mosque of Bayezid I., and the Green Mosque, or Mosque of Mohammed I. This last and its Turbeh adjoining, are especially notable.

The two-dome plan, in its completeness, has an open porch, or loggia, of the whole width of the entrance front; and this feature can be seen in the Bayezid and Mourad Mosques. The Green Mosque, however, was left incomplete, and the porch was never added. This mosque was built in 1420, and one hardly looks for such big, say Michelangelesque, detail in Anatolia at that time. In exterior disposition the mosque is, uniformly, of two storeys, finished with a cope, over which is a low-pitched roof. At the entrance end are two minarets, originally covered with green faïence, and evidently reconstructed since the earthquake of 1855. The exterior generally is all marble surface, and has exquisite carving at the doorway, windows and niches. The doorway is a particularly fine piece of design, both in proportion and detail. The adjoining Turbeh, or tomb of the founder, is one of the most delicious creations imaginaable. The lower part of the exterior is of white stone, with large panels of bright blue-green tiles. The upper part is painted light green, and is finished with a domical lead roof. It is of large scale.

Other most interesting mosques in Broussa, besides those already mentioned, are the Ulu Jami, or Great Mosque, the Mosque of Emir Sultan, and the Mosque of Mourad I. at Tchekirgeh. The former is a very large building, more like a bazaar than a mosque, and quite dominates the general view of the town. It is of large simple-pointed work, with two tall minarets and a forest of domes. It is finished in stucco, like most of the Constantinople mosques, and this poverty of material contrasts rather unfavourably with the Green Mosque, which is finished with marble both outside and in. Some very good brickwork is also to be seen at Broussa—in the exterior of the Mosque of Emir Sultan, and in the various Turbehs at the Mosque of Mourad II. The type of entrance loggia which was so common here, and which was continued as a feature in the Constantinople mosques, may be well seen from the Mosque of Bayreid I.

In considering the conditions of the problems presented to us by these Turkish buildings, we can learn by seeing the use the builders of them made of their materials to hand *in toto*; that is to say, of conditions of climate and religion, as well as hard matter-of-fact forces of everyday design; and, following from this, by the good old lesson on the justification of apparent eccentricities common in some form or other to every period of architecture. What strikes as boldness in a design, when we come to analyse its constructive meaning, may appear simplicity itself when the effect as it stands is only taken into account, and unworthy of any except admiring notice. For example, stripped of its effects and considered on plan, the corbelling out of the main domes of the Green Mosque on three sides only may appear freakish, but in reality it serves to make one interior of the two domes, especially as softened by the beautiful form of corbelling adopted by the Turks and all Saracen races. The fact, too, in the same building of a higher shrine inferior in cheerfulness to the lower entrance part seems peculiar on the face of it, apart even from any religious motive; but when we see that this effect is balanced by a stately gravity in the design of the entrance wall, and, moreover, is quite reasonable in itself from an æsthetic point of view, we realise a something here which gives a sense of fresh perception, and, as such, is, of course, of the highest value. The sense of strangeness in contemplating Eastern buildings at the first rush is inevitable to us, because the real East is far removed from the West in everything, including such a small thing as the treatment of an interior. The elements of the composition in a mosque interior are the fountain of cold water surrounded by cool and restful colours, and an exquisite diffused light. In the best mosques there is no attempt at strenuousness in anything. The mihrabs, though often marvels of detail, are set as a rich door in a plain wall would be, which means that they draw attention to themselves, but do not detract from the simplicity of the composition as a whole. Naturally, in Eastern countries the smallness of the entire window area necessary for lighting a building adequately vastly affects the conditions of design. It is this, perhaps, that makes he domical construction of these countries so asy, as there is no need to be eternally fussing bout this or that window which interferes with his or that construction. The total effect of ighting in two interiors (one Western and the ther Eastern) may be the same; the former vith its many windows and the latter with its ew. The advantage, however, for purposes of lecoration is distinctly with the East; the wall-spaces are broader and simpler, and the absence of an appearance of lighting forcing itself on one gives greater restfulness to the decorative effects. Thus in a measure the entire question of Eastern decoration must be considered with reference to itself alone. The large use of tiles in decoration is the prevailing characteristic of Persian art and what emanated from it. This makes possible the large spaces of plain colour which are necessary when only borders and spots of pure ornament are used. Hexagonal tiles of an exquisite blue-green, relieved by gem-like touches of pure colour, such as we see in the Green *Turbeh*, are, under the circumstances, perfectly satisfying. It is a question of surroundings and mental attitude to a large extent. Coming from the blinding sun and dusty glare of an Eastern summer into such a perfectly neutral half-light, with its cool marbles and fountains, and its atmosphere of satisfying colour, one feels a sense of the fitness of things. Use and wont and perception of long ago have made the materials which best suit the situation. The practical conclusion of the whole matter is to try and find out how the Moslem has solved the ordinary problems of his building, for naturally he has a certain discount to start with, having Persian tiles, which belong to the world's chiefest treasures of art, at his command. But if there are evidences of thought in their setting—as, I think, will easily be found in such buildings as the Green Mosque at Broussa—we can have scope, after the first burst of admiration, to contemplate wise solutions of problems which come very near to us after all. There is a strange freedom also in the treatment of much of the Turkish work which makes it easy to institute a comparison with modern work. For instance, Mr. Philip Webb's conception of stone detailing seems to me similar to the attitude of the Broussa builders in a like capacity. A strong feeling for material is evident, and a daring reserve in design which is nearly always justified in effect.

Mr. Fyfe then proceeded to explain a number of lantern slides and drawings showing the discoveries made at Knossos under the Cretan Exploration Fund, to which he had been engaged as surveyor. Following Mr Fyfe, Mr. Evans, Keeper of the Ashmolean Museum at Oxford, the director of the excavations, gave some explanation of the drawings and photographs.

The Discussion.

Mr. R. PHENÉ SPIERS, in proposing a vote of thanks to Mr. Fyfe and Mr. Evans, said it seemed strange that in those early days both materials should have been used for building which were either of a most lasting or a most ephemeral nature. But what was most strange of all was that we should find some evidence of the crude unburnt-brick walls.

Mr. A. C. DICKIE, with reference to Mr. Fyfe's remarks about Turkish architecture, said that Saracenic architecture should not be judged by representations on paper.

Mr. BERESFORD PITE, in seconding the vote, thought the word "naturalistic" hardly expressed the character of the Cretan decoration, as it was in addition highly decorative. Mr. Fyfe's description of the Turkish mosques showed how very easy it was to get up an enthusiasm for the commonplaces of architectural design. He questioned whether the Turks had any art at all. Had they any architectural forms which they did not degrade from the great Persian art which they had at their hand?

Mr. WALTER CRANE thought the frescoes discovered clearly showed a blend of Etruscan and Egyptian art.

Mr. A. T. BOLTON thought it would be a great misfortune if any student should be discouraged from investigating Turkish work. All these later Turkish buildings possessed a certain value of their own, for the ideas which the Arabs were carrying out had been partly carried on, such as in domes. Nearly almost all the Turkish architecture was the work of foreigners; he did not think the Turks had any building capacity.

Mr. R. ELSEY SMITH also spoke.

The vote of thanks was then passed by acclamation and replied to by Mr. Evans and Mr. Fyfe.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Working Hours for Architects' Assistants.

CLACTON-ON-SEA.—H. P. writes: "What are the usual business hours (provincial) for architects' assistants?"

From 9.30 to 6.

Mounted Drawings.

NORTHAMPTON.—ENQUIRER writes: "I have some drawings (mounted on strainers) which I wish to hang on a wall, and I should be glad to know how to preserve them from dust and dirt—they are not to be framed or glazed."

It is impossible to keep the drawings free from dust and dirt unless they are covered with glass, varnished, or similarly protected.

Old Lancashire Churches.

SOUTHPORT.—ANXIOUS writes: "Are there any books giving descriptions and the architectural history of the old churches of Lancashire?"

We do not know of any such books. An illustrated article on "Lancashire Church Architecture" was published in our issue for March 28th, 1900, and another on "Ancient Halls of East Lancashire" in our issue for April 25th, 1900. These may perhaps be of use to our correspondent.

Ownership of Perspective.

LONDON.—ANXIOUS writes: "I was recently engaged by an architect to prepare a perspective for a competition. His design was placed first and is now being carried out under his name. Can I submit the perspective to the building papers for publication as a design, bearing my name, not being associated with the name of the architect?"

No. If you expressly did the work for the architect the perspective belongs to him, and you are not at liberty to make use of it in the manner proposed without his consent; it is not probable that he would allow you to publish it as a separate design bearing your name.

County Surveyors in Ireland.

GALWAY.—GALWAY writes: "Is it necessary to possess indentures in order to become an assistant county surveyor in Ireland? What qualifications are necessary? Is there any way of becoming a member of either the Institution of Civil Engineers, the R.I.A.I. or R.I.B.A. other than by serving one's time to a member? What books would you recommend me to study?"

For county surveyors in Ireland, applicants need only "have been engaged upon sufficient works for a sufficient time" to have obtained experience justifying admission to the examination by the Civil Service Commissioners. The production of articles is not essential though useful; and it is just the same with the R.I.A.I. and the R.I.B.A., though in the case of both these bodies, and more particularly in that of the Institution of Civil Engineers, the Secretary should be communicated with and the special circumstances of the case carefully laid before him. With regard to books, we would suggest that our correspondent obtain particulars of the various examinations from official sources, and then consult us again upon such subjects only as he requires information. A full list of books would occupy much space, possibly unnecessarily. G. A. T. M.

Workmen's Compensation.

HARPENDEN.—A. H. S. writes: "(1) Is it advisable to insert a clause in building contracts to the effect that the contractor holds the employer free from all liability in respect of the Employers' Liability Act? (2) In what year was this Act passed?"

(1) Under the Workmen's Compensation Act, Sec. 4, you would be liable for accidents to the sub-contractors' workmen. The sub-contractors are liable to indemnify you; but nevertheless a clause such as you mention might save litigation. (2) The Employers' Liability Act was passed in 1880. The Workmen's Compensation Act, to which apparently you refer, was passed in 1897. A. O. H.

Architects' Charges for Drawings.

SEDGLEY.—F. B. H. writes: "A short time ago I surveyed a public-house for the county magistrates in respect of an appeal. I attended the Quarter Sessions (having previously been served with a subpœna) and was paid the usual professional fees and expenses. I afterwards sent in my account for the plan, &c., for which I charged three guineas. The Clerk returned the account altered to two guineas, enclosing a cheque for that amount. After corresponding with him for some time he said that he had paid me all, in his opinion, the Court would allow. What I wish to know is, have they any right to alter my account; can I claim for the full amount?"

Without further details it is impossible to say what you are entitled to claim. The Clerk, however, would seem to have acted within his rights. A. O. H.

Acoustics of Room.

CANTERBURY.—W. W. writes: "A committee-room has recently been built here the acoustic properties of which appear to be very bad The complaint is that the chairman speaking at one end cannot be heard at the other, owing to reveberation. Some suggest placing wires across the room. Would this cure the defect? The room measures 38ft. by 25ft., and is 13ft. 6in. from floor to collar beam."

Wires are considered to "damp" the sound waves so that the echoing or vibration of the air when speaking is reduced. They would be placed at the top of the vertical walls and about 5ft. apart, say, from wall plate to wall plate, but the writer has no personal experience of their efficiency. A curtain draped on the wall at the back of the speaker sometimes has the same effect. Modulating the pitch of the voice and the rate of utterance to suit the room is important in all cases, and a difficulty in hearing is often due more to the speaker than to the surroundings.

HENRY ADAMS.

Cubing Contents of House.

PLYMOUTH—DELABOLE writes: "Which is the proper way to ascertain the cubical contents of a dwelling-house of the following dimensions:—Frontage, 35ft.; depth, 30ft.; average depth of wall below damp-course, 3ft. 6in.; damp-course to eaves, 21ft. Both ends are gabled."

The way to cube up a house for approximate cost is to multiply the length by the breadth and by the height from the bottom of the footings to half-way up the slope of the roof. In the case given it will be $35 \times 30 \times 29.5 = 30{,}975$, which at 6d. per foot cube would amount to say £775. The rate will vary from 4½d. per foot cube for speculative building of the slightest character to 7d. for ordinary dwelling-houses, 9d. for substantial buildings, and 12d. or 15d. for first-class work under an architect.

HENRY ADAMS.

Making Connections with Public Sewers.

HIGHAM FERRERS—B. S. writes: "The land on the south-east side of a private road leading to a railway station has just been sold for building purposes in plots, and the plans of a pair of houses to be erected there have been passed by the rural district council, their surveyor adding the following words to the letter in which the plans were approved:—'and you can also connect your drain with the

Station Road sewer, by and with the consent of the —— Railway Company *to open up* the road to it.' (1) Is it necessary to apply for such consent, seeing that the council have the power to repair and make connections, and that all the houses on the north-west side are drained into the sewer? (2) Can the railway company legally withhold their consent provided traffic is not stopped and the road surface is restored to its original state of repair?"

(1) As a matter of ordinary courtesy—if for no other reason—the railway company should be informed of your intention to make a connection to the public sewer, and their formal consent obtained, seeing that it involves breaking up a portion of their private road. (2) So far as can be ascertained from the general statement submitted, and taking into consideration the provisions of the Public Health Acts, it is considered that the railway company would have no legal grounds for withholding their consent. T. E. C.

Builders' Notes.

The Association of Master Painters in Scotland held its annual meeting in Edinburgh recently, when Mr. Alex. Latto, Aberdeen, was appointed President of the Association for the ensuing year, Mr. John Scott, Glasgow, Vice-President, and Mr. W. B. Crawford, Glasgow, reinstated as Secretary.

Mr. P. M. Henry has introduced into his brick and tile factory at Ballydrum, Swinford, co. Mayo, machinery capable of producing from 6,000 to 10,000 solid or perforated bricks per day, which should prove a considerable boon to Irish contractors and others and will enable him to execute orders with greater promptitude than heretofore.

Mr. John Hatch, of Fenton Street, Lancaster, died recently in his 72nd year. Deceased assisted in the business of Messrs. Hatch and Sons, contractors, joiners and builders. He was formerly secretary of the Freemasons' Lodge, and was a past secretary of the Lancaster Master Builders' Association.

Messrs. Frederick Walton and Co., Limited manufacturers and patentees of Lincrusta-Walton and Caméoid, inform us that, owing to the termination of their engagement with Mr. F. E. Hine, the management of their London office and showrooms will in future be under the personal control of Mr. Alfred J. Nicholson, who has acted for some years as managing director to the company.

Mr. James Charles Gaskin, of Victoria Road, Wincheap, Canterbury, died recently. Deceased for many years carried on an extensive business as builder, painter and plumber in Canterbury, first in partnership with the late Mr. R. Godden and subsequently alone. He built and restored many of the buildings belonging to the Dean and Chapter and many churches and schools in Canterbury and other parts of East Kent.

The Sheffield Master Builders' Association held its annual meeting last week, Mr. James Longden, president, being in the chair. Mr. Longden having accepted the presidency of the Yorkshire Federation of the Building Trades, Mr. J. Biggin was elected president of the Sheffield Association. Mr. A. J. Forsdike was appointed vice-president, Mr. A. Mastin treasurer, and Mr. W. J. Spink secretary. The president, vice-president, and Messrs. A. Mastin, T. Roper and M. Grantham were elected representatives to the Yorkshire Federation

The Midland Centre of the National Federation of Master Builders held its annual meeting recently at Birmingham, when in the place of the retiring president (Mr. Jas. Wright, Nottingham) Mr. Arthur Chambers (Leicester) was elected, and the other officers for the ensuing year are: Vice-presidents, Messrs. William Sapcote (Birmingham) and J. Sharman Wood (Worcester); treasurer, Mr. H. Willcock (Wolverhampton); auditors, Messrs. J. V. Porter (Derby) and F. G. Whittall.

The Wakefield and District Master Builders' Association held its annual meeting recently. At the commencement of the proceedings, Mr. Elvey, the retiring president, occupied the chair. Councillor W. Judge was unanimously elected president for the coming year. Mr. Elvey was elected senior vice-president and the meeting also elected Councillors Denholm and Driver, and Mr. G. Crook as additional vice-presidents. The following were elected as the committee:—Messrs. C. S. Denison, H. Fallas. J. B. Hesling, J. Pashley, G. Wilson, H. Blackburn, J. E. Bramald, J. Johnson, J. Lazenby, W. H. Moss, J. Woodhead, G. W. Sanderson, M. E. Rycroft and G. R. Parker. Mr. Elvey was also elected the representative of the Association on the committee in connection with the Yorkshire Federation of Employers—Mr. G. Beamont was re-elected secretary. The balance sheet (which had been audited by Messrs. J. E. Bramald and J. Pashley) showed a balance in hand of £10 17s. 8½d.

London County Council.—At last week's meeting of the Council the Chairman announced that a letter had been received from Mr. Horniman offering to the people of London on behalf of his father, Mr. Horniman, M.P., about fifteen acres of freehold land at Forest Hill, together with the museum which has just been erected at the cost of about £40,000. In it are placed the large art and natural history collections gathered by Mr. Horniman during the last twenty-five years. The offer was accepted. The Highways Committee recommended the acceptance of the estimate of £7,900 for the construction of new tramways in Crowndale Road, Agincourt Road and Constantine Road, in the district of St. Pancras. The recommendation was adopted. The Water and Public Health Committees brought up their joint report in reference to the proposed amended regulations of the London water companies. The recommendations of this report, which are mainly in the direction of condemning the proposed regulations, were submitted on the previous day to a conference of the local authorities of the metropolis (see p. 25 of this issue). The recommendation to oppose the regulation as to cisterns with a view to its being struck out was carried by 99 votes to 4. A resolution was adopted in favour of subways under the leading thoroughfares to contain all gas and water pipes and telegraph and telephone wires.

The Builders' Foremen's Association held its seventh annual dinner at the Holborn Restaurant on Saturday last. More than 150 sat down to dinner, under the chairmanship of Mr. Henry Hibberd. After the toast of "The King and the Royal Family" had been honoured by the singing of "God Save the King," the chairman proposed briefly "Success to the Builders' Foremen's Association." In responding to this toast Mr. E. C. Akermann, the president of the Association, explained its objects. The Association had been in existence for eight years, and the membership was steadily growing. It was of the nature of a self-help association whereby members in difficulties or out of employment were assisted by their fellow-members. But it did not neglect the educational and social elements, lectures, outings, and smoking concerts being held from time to time. Recently also a scheme of insurance had been introduced by which on the death of any member his relatives were entitled to a sum of money. The president paid a well-deserved tribute to the secretary, Mr. W. Cook, to whose enterprise and untiring energy he attributed the success of the Association. Mr. Cook's name was also coupled with the toast and his health was drunk with musical honours. The toast of "The Building Trades" was proposed by Mr. G. H. Webster, who in the course of his remarks referred to the opinion held by many employers—a just opinion he considered—that foremen could not in fairness to their employers or to themselves belong to any trades union, and it was then that an association such as the Builders' Foremen's Association was of benefit. It remained to be seen whether employers in London would imitate the action of employers in the north by offering foremen inducements to retire from the trades unions. He further stated that merchants could ease the troubles of the foremen very much if they studied the order in which materials should be supplied and sent them quickly. His experience was that materials required last came first, and the first last. In responding to this toast Mr. Mackenzie said he considered that the men of our country to-day showed themselves to be worthy successors of the ancient nations who taught us how to build. Other toasts duly honoured during the evening were "The Visitors" and "The Chairman." An excellent programme of vocal and instrumental music was interlarded with the speeches and a thoroughly pleasant evening was spent. The address of Mr. W. Cook, the secretary of the Association, is 10 Manor Park Road, East Finchley.

Surveying and Sanitary Notes.

A new Park for Tottenham is to be purchased by the Tottenham District Council for a public recreation ground. The site selected is part of the estate known as "Down Hills," and consists of a mansion, its grounds, and three large fields. The whole comprises nearly 30 acres.

Sanitary Inspectors.—Miss Marie Stewart, 24, of London, has been appointed by the Leeds Corporation a sanitary inspector for the city. The lady succeeds in the office Miss Hobson, who has resigned. The new inspector was educated at Girton, and has been studying medicine. The post was sought for by about a dozen ladies. The following is a list of the candidates who passed in the recent examination for Sanitary Inspectors:—Miss G. D. Bevan, Miss I. W. Cox, Mr. V. E. F. Donnewald, Mr. A. Griffiths, Mr. R. E. James, Miss G. A. Looker. Mr. C. W. Rudd, Miss L. L. Spiller, Mr. A. H. Walker, and Mr. A. Wheaton.

Sewage Disposal at Waddesdon and Haddenham.—A Local Government Board inquiry was held at Waddesdon by Mr. F. H. Tulloch, M.I.C.E., into a petition presented by the Aylesbury Rural District Council for power to put in force, with reference to certain lands required by them for purposes of sewage disposal for the township of Waddesdon, the Land Clauses Act, with respect to the purchase and taking of lands otherwise than by agreement. The land in question was about three acres of glebe adjoining the Quainton Road, of which the Rev. Dr. Yule, as rector, is the life owner. Mr. Guest Luckett, Engineer to the Council, was present, and explained the scheme to the inspector. On the following day a similar inquiry was held at Haddenham by the same inspector. Mr. G. Luckett on this occasion was also present as engineer of the scheme, and explained the plans. In both cases there was considerable opposition.

Masters and Men.

The Northern Bricklayers' Dispute.—A meeting of the employers in the building trade was held at Newcastle last week to consider the bricklayers' prolonged dispute and the proposed arbitration proceedings. It was intimated that an agreement had been come to with the operatives that the Board of Trade should appoint an arbitrator, and that such would shortly be appointed. The Arbitration Court is expected to meet at an early date; the men, however, do not return to work until after its sitting.

Bricklayers' Strike at Brentford.—During the past three or four weeks a bricklayers' strike has been in progress in Brentford. It arose out of the usual question of wages, and the firm affected is Messrs. Dorey and Co. It appears that the bricklayers employed by this firm gave a six months' notice that they would go out on strike if they did not receive an extra ½d. per hour pay. The six months elapsed but there was no sign of an increase, so the men allowed another two weeks to go by without any result. The bricklayers employed by the firm number upwards of 100. Messrs. Dorey have been able to fill the vacancies. The men out on strike are members of the Bricklayers' and General Labourers' Union, and are hopeful of getting the increase they asked, and also re-employment. The labourers also gave notice some time ago that they would strike if they did not get an increase in wages. The time given, however, has not yet expired, but the desired increase in their pay has not been given.

New Patents.

These patents are open to opposition until March 16th

1900. — Wrought-iron Girders.—20,245. C. HESSEL, 59 Neue Winterfelderstrasse, and W. SIPPEL, 88 Kopnickerstrasse; both of Berlin. The beam is formed with large oblong perforations in the web, which is thicker than usual. The weight of the beam is thus reduced and its cost is less. The feature of the invention is that the beam leaves the rolling mill quite finished and ready for use.

Wall and Ceiling Decorations. — 22,177. D. M. SUTHERLAND, Westholme, Sunbury Common, Middlesex. The object of this invention is to produce an embossed fabric of great flexibility with a non-absorbent surface not needing to be sized either before or after being hung. This is accomplished by taking a sheet of paper or asbestos and passing it through a pair of calendar rolls so as to apply a very thin coating of waterproof composition in any desired colour. This is allowed to set and the paper is then embossed in the usual manner by a rotary embossing machine.'

Partitions.—22,303. E H. BELL, 40 Lisle Street, London. The special plastic material of which the partitions are composed is made as follows:—About 40 parts of good brickmaker's clay is mixed with about 60 parts of infusorial earth, the whole being made plastic with a 10 per cent. solution of calcium chloride, to which 10 per cent. of sulphate of magnesia is added. With this plastic material may be incorporated a suitable quantity of asbestos waste and of wood wool. The latter is burnt out subsequently, leaving innumerable small channels in the material, thus making it extremely light and porous.

The following specifications were published on Saturday last, and are open to opposition until March 23rd. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—1,310, SAYERS, elevators. 2,656, SCHOTT, pumping apparatus for slip and glazes used in the manufacture of pottery. 2,709, LEROY, gas generators. 3,413, STEVEN AND COLQUHOUN, construction of kitchen ranges. 3,555, TAIG, TAIG, TAIG AND ROBERTSON, means for lighting street and other gas-lamps. 3,773, JONES AND JONES, chimneys and stoves. 3 994, AITON, pipe joints. 4,722, WEBSTER AND THORNTON, measuring rules. 4,790, PRESTON AND JAKEMAN, manholes and manhole covers. 4,812, POTTER, forming wood floors. 5,098, HALL AND BOARDMAN, LTD., AND HALL, manufacture of bricks. 5,297, DRENCKHAHN AND SUDHOP, manufacture of cement pipes. 5,417, WOODHOUSE, syphon-discharge flushing cisterns. 5 922, LESSING AND RHEINFELD, process for burning cement, gypsum, &c. 6,361, BRAY, construction of gas burners. 9,443, EDWARDS AND EDWARDS, pulleys. 9,658, FRASER AND CHALMERS, LIMITED (*Stumpf*), pumps. 13,139, HOOK, lighting and extinguishing of street and other gas lamps at pre-determined times. 13,248, REEKIE, plugs for drain and other pipes. 16,731, ULLRICH, chimney top. 18,457, KIELBERG, manufacture of pipes of cement or similar material. 18,653, STEVENS, fastening devices for window sashes. 19,267, SCHEELE, incandescent gas burners. 20,356, FOLEY, roofing tiles. 20,725, LAKE (*Worstall & Hackathorn*), manufacture of varnish. 22,311, MOORE, doors or gates. 22,404, CROPPI and EDANT, apparatus for flushing water-closets. 22,491, CARPENTER, incandescent gas burners. 22,492, CARPENTER, apparatus for fitting pegs to incandescent gas burners. 22,564, AITKEN, rotary pump for air, water, etc. 22,821, SIDEBOTTOM, circular fan for ventilation. 23,027, CARPENTER, igniting of incandescent gas burners.

Keystones.

The Architectural Association of Ireland held a meeting last week, when a resolution of condolence with the King and the Royal Family on the death of the Queen was adopted, being proposed by Mr. R. M. Butler and seconded by Mr. F. G. Hicks. Mr. P. J. O'Reilly then delivered a lecture on the Mont St. Michael in Normandy.

Frescoes at the Royal Exchange.—An offer has been made by Mr. Alderman and Sheriff Vaughan Morgan and Mr. Sheriff Lawrence to contribute a panel painting to the ambulatory of the Royal Exchange in commemoration of the recent proclamation of the King on the steps of that building. The offer will, no doubt, receive the most grateful consideration of the Gresham Committee, the members of which decide all questions respecting the decoration and management of the Royal Exchange.

Mr. John Murray Robertson, F.R.I.B.A., architect, of Albert Square, Dundee, died at Crossmount, Perth, on January 31st. Mr. Robertson was born at East Mains, Strathord, Perthshire, in 1844. At the age of sixteen he entered the office of the late Mr. Andrew Heiton, architect, Perth. For the last twenty-five years he was closely identified with Dundee. His special line in architecture was the Queen Anne style. He was the architect of the Royal Victoria Hospital and the Caird Hospital for Women, Dundee; the Lochee Baths and Free Library, and of many of the most prominent mansions in Forfarshire and Perthshire, Balboughty House, near Perth, being a good type of his work. In Perth he was architect-in-chief to the Messrs. Pullar, and designed the Consumptive Hospital for Perth, which is not yet completed.

Cardiff's New Asylum.—Out of a large number of plans sent in for a new asylum for Cardiff, Mr. George T. Hine, the professional assessor and advisor to the Commissioners in Lunacy, selected six for the second stage of the competition. One was, however, paid out, because it was discovered that he was in the employ of Mr. Hine, who, it should be mentioned, was not aware that he had sent in plans, the names not being submitted to him. Mr. Hine has now reported upon the remaining five plans, and declares the best set of plans to be those sent in by Messrs. G. H. Oatley and W. S. Skinner, Edinburgh Chambers, Bristol. The premium of £500 will merge into the architects' commission, which has been fixed at 5 per cent. on the cost of the building. The following architects get £100 each to compensate them for their time and trouble:—Messrs. Law and Allen, Arundel Street, London; Messrs. Greenaway and Newbury, Queen Anne's Gate, London; Messrs. Hooley and Sanders, Nottingham; and Messrs. Wills and Anderson, Swansea.

The Ruskin Union held its first annual meeting last week, Mr. J. A. Hobson presiding. The report, which was adopted, stated that the union—inaugurated on February 8th, 1900, the 81st anniversary of Ruskin's birth—numbered at the close of the year 219, of which number 23 were corporate members with 29 elected representatives. The corporate members consisted of Ruskin societies having a large membership in several of the chief towns of the United Kingdom. The council had appointed a memorial committee with power to collect funds for the raising of a national memorial to Mr. Ruskin, and a special committee had been appointed to consider a resolution that, as a Ruskin memorial, the house and grounds formerly occupied by John Ruskin at Herne Hill should be acquired, a settlement formed there, with collections of natural history and art, with a suitable library. Further, that an effort might be made to place a statue or portrait of John Ruskin in the Turner room of the National Gallery. The members of the council were elected, amongst them the Bishop of Durham, Lord Windsor, Sir Walter Parratt, Sir J. D. Linton, the Warden of Keble, Sir Henry Harben, Sir F. Seymour Haden, Mr. T. Burt, M.P., Bishop Barry, Professor Attwell, and Mr. R. A. Allison, M.P. A lecture on "Ruskin and Literature" was afterwards delivered by Mr. R. Warwick Bond.

A Roman Catholic Church is to be erected at Moor Lane, Ashton-in-Makerfield.

The Glasgow Technical College.—The fund being raised for the erection of new buildings for this college has now reached £71,531.

A new Theatre at Folkestone is to be erected at a cost of £20,000 by the Folkestone Pleasure Gardens Company, and the old theatre will be adapted to winter garden purposes.

A Stained-glass Window has been placed on the east side of Wesley's Chapel, City Road, as a memorial to the late Mr. W. Willmer Pocock, B.A., the well-known architect of the Metropolitan Tabernacle.

Mr. F. B. Howarth, architect and surveyor, has opened an office at Bilston, Staffs., the address of which will be the Town Hall Chambers. The office at The Firs, Sedgley, near Dudley, will also be kept on.

The Design for New Baths at Swinton, submitted by Mr. T. J. Bushell, architect, of Manchester, at a cost of £4,725, have been recommended for acceptance by the Swinton and Pendlebury Urban District Council.

The Plans for the Connaught Theatre, Tottenham, which will have a seating capacity of 2,000, have been passed by the Middlesex County Council. The architects are Messrs. Owen and Ward, of Birmingham. Building operations will be commenced early in March in order to open the theatre on Boxing Day.

A New House of Parliament is to be erected in Western Australia. A sum of £100 000 is to be set aside for the work, and £500 is to be spent on a design, this being offered to the architect whose plans meet the sanction of the authorities at Perth. It is noteworthy that designs are not invited from architects outside Australia.

A Memorial to John Ruskin was unveiled last week, on the anniversary of his birth. The memorial is a beautiful mural tablet in St. Paul's Church, at Herne Hill, executed in coloured marble, surmounted by a white medallion of Ruskin, from a design by Mr. Brindley, advised by Sir William Richmond and Mr. Arthur Severn, Ruskin's relative. Mr. Holman Hunt unveiled the tablet.

Chichester Cathedral.—A legacy of £500 left by the late Mr. J. F. France is to be devoted to the restoration and repair of the west porch and entrance to the cathedral. The western entrance is flanked by two towers, one of which has just been rebuilt, and is considerably below the surrounding level, while it is overshadowed by trees. Even in the middle of summer the entrance strikes one as cold and damp, and, like so many other portions of the nave, it sadly needs repair.

"Modern Opera Houses and Theatres," the monumental work by Mr. Edwin O. Sachs, is to be reissued by Mr. B. T. Batsford in the spring. Mr. Sachs' work comprises three grand folio volumes with 220 plates and over 1,000 illustrations; and the first edition appeared 1896 to 1898, after having required over eight years' preparation. The work is by far the most comprehensive on any special architectural subject published during the past century. The new issue will be in no wise inferior to the original, and will contain a special prefatory note dealing with the latest developments and improvements in theatre architecture which Mr. Sachs has to such a great extent been instrumental in bringing about, not only at home, but in foreign countries.

London Street Architecture.—The building, No. 27 High Street, Kensington, illustrated on page 19 of this issue, was erected about three years ago from designs by Professor Banister Fletcher and Son, architects, and comprises shop premises with residential chambers over. The front is faced with red bricks relieved with stone dressings. The bay window is entirely of stone, with a brick parapet surmounted by a flush stone coping. The woodwork is painted green, which forms a pleasant contrast to the yellow stonework and red facings. The side walls to the balconies have painted tile panels, representing four great composers—Mendelssohn, Mozart, Handel and Bach. Our drawing is by Mr. Sydney Newcombe. Other illustrations of this series will be found in the issues for October 17th and December 5th, 1900.

Trade and Craft.

Lockerbie and Wilkinson's New Catalogue.

Messrs. Lockerbie and Wilkinson, Limited. are now issuing a new catalogue, which is very complete and excellently produced. The firm, who have their warehouses and head offices at Birmingham, their works at Tipton, Staffordshire, and their London office at 109 Victoria Street, S.W., have illustrated a large collection of artistic patterns in brassfoundry, repoussé work, &c., the reasonable prices of which should commend them to the attention of the increasing number of architects who are anxious to obtain fittings of good design at reasonable prices. Many interesting specialities are also shown, notably the firm's tubular ball-bearing door runners for sliding doors and folding partitions. The increasing use of the latter in schools makes these special fittings a welcome addition to those already on the market. Running on ball bearings throughout, the partition can be opened and closed with the greatest ease, and inasmuch as it has a bearing at the head only, instead of at the sill, its working is not dependent on the evenness of the floor; this has special significance when the partition is being erected in a building where the floors have become uneven through wear. The fittings are inexpensive, and can be very easily applied. Another prominent feature of the catalogue is the elaborate way in which the numerous fanlight and lantern-light stays and gearing are illustrated. It is often so difficult to understand from illustrations how gearing works that any simplification of an architect's labours in choosing an opener is welcome. The catalogue is bound in green cloth of a pleasing colour, and has a striking design on the cover (which is reproduced above). Any architect who does not receive one in the ordinary course of distribution should certainly apply for a copy.

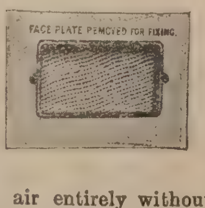
The "Offa" Ventilator.

The "Offa" ventilator, illustrated below, is intended to be fixed as an inlet, to any apartment or vehicle between 1ft. 6in. and 5ft. from the floor. It is claimed that the opening of windows is no longer necessary where it is in use, that it is noiseless, and that it admits a controllable quantity of air entirely without draught. It is simple and inexpensive in construction, consisting of a frame for building into the wall, carrying an effective air-strainer which is easily removed from the inside when dirty. The frame has sockets in which slide pins carrying a face-plate, which may be drawn out to any required distance or pushed in flush with the wall to close the opening. By an ingenious arrangement the face-plate is prevented from being completely withdrawn—unless it is desired to remove it for cleaning—by stops which are disengaged by a single movement of the handle. There are no loose parts to rattle or screws requiring tools, and every part is easily accessible from the inside for cleaning purposes. The air on entering from outside, after passing the filtering screen, strikes the face-plate and is immediately dflected in every direction, except forward—in fact is compelled to *soak* into the room, causing no draught. In the event of a strong wind blowing on the outside, an exhausting action is set up, the ordinary inlet action being resumed during lulls. The ventilator has been well tested in various places, and it has been found unnecessary to provide any special outlets for foul air where the "Offa" is in use. In 1895 one of the bakeries at Messrs. Huntley and Palmer's factory at Reading was fitted with several of these ventilators. The original working temperature of the building was 120degs. Fahr. with three large fans in action, causing a strong draught to enter at every opening. On the introduction of the "Offa" ventilators an immediate lowering of the temperature to 60degs. Fahr. took place, there were no draughts, and the fans were stopped and finally done away with. The men work within 3ft. of the ventilators and are comfortable. For hospital work it should prove valuable, because it cannot be tampered with by patients, it can be fixed close to the beds, and, if sterilising screens be used, any particular ward or room can be isolated with ease. The screens can be changed once a week, if desired, at a cost of less than 1s. per bed per annum. The "Offa" ventilators are made for building purposes in five sizes, from a 10in. by 7in. face-plate to one 21in. by 18in.; they are sent out packed complete with all screws required for fixing, and can be obtained in plain polished brass, repoussé copper, or enamelled cast-iron. If it is necessary to conceal them, a picture may be hung in front without affecting their efficiency. Smaller sizes are made for use in vehicles and ships. The makers are the "Offa" Ventilating Company, 64 Basinghall Street, E.C.



New Companies.

Springfield Colliery, Limited.

Registered December 31st, 1900, to carry on the business of colliery proprietors, brick, tile, pipe, and earthenware manufacturers, &c. Capital £3,000 in £1 shares. Registered office: Albion Chambers, King Street, Nottingham.

North London Estates Company, Limited.

Registered December 31st, 1900, to acquire land at Wood Green, and to carry on the business of builders, contractors, &c. Capital £2,000 in £1 shares. Registered office 62 Lower Redland Road, Bristol.

Wood Mosaic Syndicate, Limited.

Registered December 31st, 1900, to acquire patent No. 22,547 of 1896, for the manufacture of mosaic work in wood, to be used for flooring, panels, insertions and inlays. Capital £9,000 in £1 shares. The first directors are G. A. Skelton and J. Ralph. Registered office: 112 Edmund Street, Birmingham.

J. Cameron Swan and Partners, Limited.

Registered December 31st, 1900, to adopt an agreement with J. C. Swan for the acquisition of the business of cement manufacturers and brickmakers carried on at Jarrow, Durham, as J. Cameron Swan and Partners. Capital £35,000 in £1 shares. Registered office: The Cement Works, Jarrow Quay Corner, Jarrow-on-Tyne.

Enfield and District Freehold Land Co., Ltd.

Registered December 31st, 1900. Capital £30,000 in £5 shares (3,000 preference). Registered office: 30 Budge Row, Cannon Street, E.C.

Norbiton Potteries and Brickworks, Limited.

Registered January 25th, 1901. Capital £10,000 in £1 shares. W. Johnson is permanent governing director. Registered office: Blagdon Road, New Malden, Surrey.

Brickworks Construction Company, Limited.

Registered December 31st, 1900. Capital £30,000 in £1 shares. The first directors are T. B. Grierson, J. Spencer, J. M. Smith and W. H. P. Henry.

The Dalziel Bridge and Roof Building Co., Ltd.

Registed in Scotland to carry on the business of iron and steel roof and bridge builders, &c. Registered office: 4 Clyde Street, Motherwell. Capital £30,000 in £1 shares.

Vineyards Brickworks Company, Limited.

Registered December 31st, 1900, to carry on the business of a land, building, advance, and investment company; also of brick makers, potters, sand and lime merchants, &c. Capital £5,000 in £10 shares.

Estates Combine, Limited.

Registered December 31st, 1900, to carry on the business of financiers, builders, &c. Capital £5,000 in £1 shares. The first directors are W. J. Bennett and G. Russell. Registered office: 112–113 Temple Chambers, Temple Avenue, E.C.

Concordia Harbour and Docks Syndicate, Ltd.

Registered December 31st, 1900, with 20 members each liable for £1, to acquire a concession granting the right to build a port on the Rio Uruguay, and to carry on the business of harbour, railway, and general contractors, &c. Registered office: 122 Victoria Street, S.W.

South AfricanPortland Cement Syndicate, Ltd

Registered December 31st, 1900, to carry on the business of Portland and other cement, lime, plaster and artificial stone manufacturers, &c. Capital £2,500 in £50 shares.

John Fletcher, Limited.

Registered December 31st, 1900, to acquire the business now carried on at Carnarvon by the Slate Syndicate, Limited, and to carry on the business of manufacturers of and dealers in marble, granite, stone, slate, bricks, tiles, &c. Capital £5,000 in £5 shares. The first directors are D. T. Edwards, J. Fletcher and T. J. Hughes. Registered office: Victoria Docks, Carnarvon.

COMING EVENTS.

Wednesday, February 13.

Institution of Civil Engineers.—Students' visit to the Engineering Models at the Victoria and Albert Museum, South Kensington, at 2.30 p.m.

Edinburgh Architectural Society.—Mr. William A. Agnew on "Electric Power in Buildings," at 8 p.m.

Institute of Sanitary Engineers.—Meetings of Examination and Literary Committee at 3 p.m.; General Purposes and Finance Committee at 4 p.m.; Election Committee at 5.15 p.m., and Members' Sessional Meeting at 7 p.m.

Sanitary Institute.—Mr. Thomas Blashill on "The State of Our Streets," at 8 p.m. Lectures and Demonstrations for Sanitary Officers: Part I. Inspection and Demonstration at Lambeth Disinfecting Station, Wanless Road, Loughborough Junction, at 3 p.m.

Thursday, February 14.

Sheffield Society of Architects and Surveyors.—Mr. H. H. Statham, F.R.I.B.A., on "Our Cathedral Fronts: A Comparative Criticism."

Sanitary Institute – Lectures and Demonstrations for Sanitary Officers: Part I.—Mr. J. Priestley, B.A., M.D., on "Sanitary Law," 7 p.m.

Institute of Electrical Engineers.—Adjourned discussion on Mr. W. M. Mordey's paper on "Capacity in Alternate Current Working," at 8 p.m.

London Institution. — Professor A. C. Haddon, D.Sc., F.R.S., on "The Decorative Art of Primitive Peoples," 6 p.m.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

ARBROATH.—Accepted for the plumber, slater and plasterer's work required in erection of a joint infectious diseases hospital for the burgh of Arbroath and the Arbroath district of the county of Forfar. Mr. Hugh Gavin, architect, Arbroath :—

Christie & Anderson, masons	£4,263 7 6
A. Scott, joiner	2,640 0 0
D. McKay, Carnoustie, plumber	1,385 0 0
J. Mitchell & Sons, slaters	382 19 0
Middleton & Donald, plasterers	389 0 0

[All of Arbroath.]

BELVEDERE, Kent.—For the erection of proposed Board offices, &c., and cookery centre at Picardy Schools, Belvedere, for the Erith School Board. Messrs. Ford, Son & Burrows, architects, Aldermanbury, E.C. :—

Board offices, pupil teachers', attendants' and waiting rooms, &c.

Woodward & Co.	£4,298	Miles	£3,860
Patman & Fotheringham	3,958	Foster Bros.	3,504
Martin, Wells & Co.	3,951	Proctor	3,493
Tonge	3,916	Thomas & Edge	3,464
Jerrard & Sons	3,874	Enness Bros.*	3,363

Cookery centre, &c.

Woodward & Co.	£2,301	Miles	£2,142
Patman & Fotheringham	2,181	Foster Bros.	2,013
Martin, Wells & Co.	2,179	Proctor	2,295
Tonge	2,088	Thomas & Edge	2,069
Jerrard & Sons	2,198	Enness Bros.*	1,997

Alterations and additions to drains and to caretaker's house, infants', boys' and girls' school, by Jennings.

Woodward & Co.	£625	Miles	£547
Patman & Fotheringham	574	Foster Bros.	540
Martin, Wells & Co.	601	Proctor	547
Tonge	558	Thomas & Edge	565
Jerrard & Sons	603	Enness Bros.*	547

* Accepted.

BRITON FERRY, Wales.—For the erection of a public library and Council offices and other work in connection therewith, for the Briton Ferry Urban District Council. Mr. H. Alex. Clarke, architect, Briton Ferry :—

J. S. Chubb & Co., Cardiff	£4,135 5 3
J. E. Evans, Cardiff	3,579 0 0
D. Jenkins, Swansea	3,500 0 0
Bennett Bros., Swansea	3,450 0 0
Bowers & Co., Hereford	3,420 0 0
A. J. Howell, Cardiff	3,416 13 10
L. Gower, Briton Ferry	3,315 17 6
M. Cox, Port Talbot	3,150 0 0
J. Goodridge & Son, Swansea	3,188 10 0
W. E. Willis, Ystrad	3,117 0 0
T. Watkins, Limited, Swansea	3,094 0 0
T. W. Waters, Swansea and Briton Ferry*	2,970 15 0
D. Thomas & Son, Cardiff	2,929 16 6

* Accepted. [Architect's estimate, £2,965.]

DEVONPORT.—For alterations to St. Aubyn Vicarage, for the Rev. Coulthard. Mr. Edgar M. Leest, architect, Public Hall Chambers, Devonport :—

W. J. Oliver	£138 5 5	A. Truscott	£102 0 0
T. Jenkin & Son	122 0 0	S. Perkins, Devonport*	99 15 6
J. Healy & Son	121 15 0		
D. Veale	110 16 8		

* Accepted.

GOUROCK, Scotland.—For the laying of whinstone or granite setts and tar macadam pavement, &c., on the principal thoroughfare of the burgh, for the Town Council. Mr. Alexander Duthie, C.E., burgh surveyor :—

J. Greenshields & Co., Glasgow	£8,551 2 6
W. Wilson, Croy	8,417 5 0
A. A. Lang, Gourock	8,048 18 4
D. & J. Stratton, Sandwich Place, Edinburgh	7,220 0 0
W. Shepherd, Milkstone, Rochdale*	5,047 15 0

Tar macadam only.

Wilson & Leitch, Glasgow	5,625 0 0
G. Halliday, Limited, Rothesay	3,562 10 0
W. G. Walker & Co., Ayr	3,562 10 0

* Accepted.

KINGSTON-ON-THAMES.—For the erection of additions to laundry and coal stores at the Kingston Workhouse. Mr. W. H. Hyde, architect, 87 Brayards Road, Peckham, S.E. Quantities supplied :—

J. W. Brooking	£3,000 0 0	E. Chamberlain	£2,608 5 9
Goddard & Sons	2,888 0 0	W. J. Renshaw	2,497 0 0
E. F. McCarthy	2,766 13 3	Veale & Carter	2,398 0 0
Windsor & Co.	2,711 8 0	W. J. Bowden	2,122 10 0
Foster Bros.	2,677 0 0		

LONDON, W.—For forming a new street from Kensington Square to Charles Street, for the Kensington Borough Council. Mr. Wm. Weaver, C.E., borough engineer :—

H. Boyer, Terminus Wharf, Paddington, W.	£1,392 0 0
Acme Wood Flooring Co., Victoria Park, N.E.	1,388 5 10
J. Mowlem & Co., Grosvenor Wharf, Westminster	1,362 0 0
E. Rogers & Co., 6 St. Lawrence Road, Notting Hill, W.	1,347 0 0
J. Mears, Crab Tree Wharf, Fulham	1,340 0 0
Improved Wood Paving Co., 46 Queen Victoria Street, E.C.	1,327 0 0
B. Nowell & Co.,* Warwick Road, W.	1,300 0 0

* Accepted.

LONDON, N.—For the erection of new branch library at Highgate, for the Hornsey Urban District Council. Mr. W. H. Hyde, architect, 87 Brayards Road, Peckham, S.E. Quantities supplied :—

Leslie & Co.	£5,258	Wilson Bros. & Lamplough	£4,516
Thompson & Beveridge	4,912	W. T. Batchelor	4,360
Kerry and Sons	4,800	Willmott & Sons	4,286
General Builders' Co.	4,797	Foster Bros.	4,174
H. L. Holloway	4,781	Lawrence & Sons	4,169
Spiers & Sons	4,676	Webking & Co.	4,161
Chessum & Sons	4,613	W. Wade	3,998
J. Appleby	4,600		

ROCHFORD, Essex.—For the erection of an isolation hospital near Sutton Ford Bridge, Rochford, Essex, for the Rochford Rural District Council. Messrs. C. & W. H. Pertwee, architects, Chelmsford :—

Foster Bros., Suffolk Road, Norwood Junction, S.E.	£5,169
Gibb & Co., 1a Birchfield Street, West India Road	4,800
Smith & Son, Chipping Hill, Witham	4,669
A. W. Robins, High Street, Wanstead	4,598
S. Parmenter, Braintree	4,500
Enness Bros., Erith Road, Erith	4,498
Snewin Bros., High Road, Upper Clapton	4,464
West Bros., Caxton Road, Strood, Kent	4,430
E. West, Chelmsford	4,242
J. Rayner, East Hanningfield	4,078
Davis & Leaney, Lancaster Gardens, Southend	4,028
Hammond & Son, Romford	3,989
F. Dupont & Co., Southchurch Road, Southend	3,987
T. H. Coleman, Foster Hill Road, Bedford	3,945
F. & E. Davey, Queen's Road, Southend	3,897
Coulson & Loft, East Road, Cambridge	3,888
W. E. Daney, Burdett Avenue, Southend	3,820
S. Norden, Rochford,*	3,810
Harris & Rowe, Shoeburyness	3,724

* Accepted.

ROMFORD.—For the laying-out and fencing of a cemetery at Upminster, and the erection of a chapel, &c., in connection therewith, for the Romford Rural District Council. Mr. E. M. Whitaker, architect, 1 Gresham Buildings, Basinghall Street, London, E.C. :—

S. Saunders, Earl's Court Square, W.	3,120
Sumpter Bros., Plaistow	2,649
D. Gibb & Co., West India Dock Road	2,565
Bowman & Sons, Stamford	2,348
Griffiths & Co., Limited, Bishopsgate Street, E.C.	2,214
T. Bruty, Hornchurch	2,127
W. Hook, Upminster	2,080
S. Parmenter, Braintree	2,016
Coulson & Loft, Cambridge	1,919
Hammond & Son, Romford	1,897
Dowsing & Davis, Romford	1,895

SOUTH SHIELDS.—Accepted for rebuilding "The Blue Bell" Inn, at Ryhope, Sunderland, for "Joseph Johnson." Mr. Henry Grieves, A.R.I.B.A., architect, Albany Chambers, South Shields :—

Taylor & Welford, Sunderland	£3,255

SURBITON.—For the erection of mortuary, Alpha Road, and road works, Tolworth and Surbiton Hill, for the Urban District Council. Mr. S. Mather, A.M.I.C.E., surveyor :—

Mortuary.

E. Tomkinson	£798 0 0
McDonald Bros.	733 0 0
Higby & Rawson, Thames Ditton	674 12 0
W. Hobern	609 0 0
J. Pavey, Wood Green	598 0 0
G. Merredew,* Kingston-on-Thames	598 0 0

[Surveyor's estimate, £617 2s.]

Making-up Roads.

R. M. Parkinson, Peterborough	£2,598 0 0
C. Ford, Harlesden	2,170 0 0
Fry Bros., Greenwich	2,168 16 8
Free & Sons, Maidenhead	2,088 15 2
T. Adams, Wood Green	2,057 9 8
S. Atkins, Kingston-on-Thames	1,841 0 0
J. Nicholas	1,751 16 0
S. Kavanagh*	1,650 4 9

[Surveyor's estimate, £1,699 2s.] [Rest of Surbiton.]

* Accepted.

WEST HAM.—For making up the following streets, for the West Ham Town Council :—Bethell Avenue, Florence Street (part), Shepherd Street (part), Chargeable Street (part), Pigwell Lane, Gipsy Lane (part), Chatsworth Passage, Passage Whitehall Place, Sutton Court Road (part), Upperton Road (part), Pond Road, Richardson Road, Wakelin Road. Mr. John G. Morley, borough engineer :—

T. Adams, Green Lanes Goods Station, Great Eastern Railway, Wood Green	£7,686 11 6
R. Ballard, Limited, Child's Hill, N.W.	7,591 3 11
J. Jackson, Broadway, Plaistow	7,362 5 7
D. T. Jackson, 104 Ripple Road, Barking	7,309 10 9
W. Griffiths & Co., Limited,* Hamilton House, Bishopsgate Street, E.C.	6,948 18 7

* Accepted.

WHITBY.—For extensions and alterations to the Fylingdales Waterworks, for the Whitby Rural District Council. Mr. John Rickinson, Robin Hood's Bay, engineer :—

A. Palfreman, Whitby	£2,655 0 0
F. W. Winterburn, Whitby	2,640 0 0
J. Stephenson, Whitby	2,495 0 0
E. Russell,* Robin Hood's Bay	2,888 10 0

* Accepted.

Godalming Old Market Hall.—The Town Council of Godalming had a debate recently on the subject of what should be done with this hall, when it was proposed to repair it and utilise it as a reading room. Amendments to take a vote of the burgesses, and to defer the matter, were both negatived. One member suggested selling the hall to those who had petitioned for its preservation, and asking them to take it away and preserve it, whilst another described the building as a hideous obstruction. The council decided by eleven votes to six to repair and maintain the hall.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

FEBRUARY 20, 1901.
No. CCCXV.

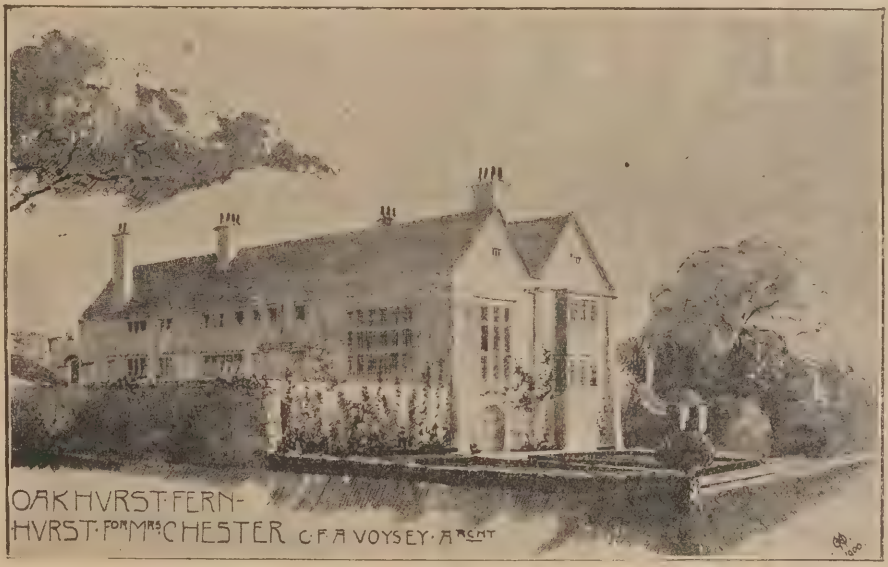
EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

A Monument To Queen Victoria. MANY years ago the Prince Consort suggested that the public offices should be removed from Whitehall to South Kensington, and occupy the site now filled by the Imperial Institute the Natural History Museum and other buildings. In those days the Thames was not embanked; several of the older Government buildings were very insignificant, and the idea of a systematic laying-out of Whitehall, though entertained for a moment, had been given up. It was said that under the proposed scheme the buildings "would be out of the smoke," but the growth of London has long since dispelled that notion. The project was abandoned, but a land of museums has taken its place and close by is the Prince Consort's own monument. Where will the Queen's be placed? From the point of view of architectural effect and the embellishment of London the question is of the highest importance. The suggestion will possibly be made that it should stand near the Albert Memorial, yet what an opportunity would be lost if this were done, for another site seems infinitely better adapted for the purpose; this is the open space known as Parliament Square. Here are two little grass plots with statues of statesmen at their outer edge placed at long distances apart, "emphasising nothing by nothing emphasised," surrounded by vast empty spaces and wide roadways. On the whole the effect of these clearances is pleasant, but the total space is a little too wide for the finest architectural effect; the great buildings are well seen, but are also slightly dwarfed; the eye gets accustomed to them as they are so gradually approached, and we lose the sense of size; in short, to be effective, buildings and spaces must be proportioned to each other. St. Margaret's Church is the only object which gives scale to the Abbey. Something more however is required to obviate the sense of vacuity; something large and high, yet not so large as to encroach upon the public space or to narrow any thoroughfare. Surely a mighty monument to Queen Victoria might fitly be erected here, and the effigies of statesmen now so oddly scattered about re-arranged and grouped at its base. The details cannot be foreshadowed now, but in historic Westminster it would be in accordance with the fitness of things that the monument should be Gothic. Architecturally speaking, there is something wanting to break the vast void north of the Abbey without filling it; and the need will be greater when the old houses in Abingdon Street are pulled down, as they soon will be. There is some danger indeed of creating *un boulevard à vue infinie*—a huge vista apparently leading nowhere—and that is a thing much to be deprecated.

The Blind School, St. George's Circus. THE latest architectural victim to public improvement is the building known as the School for the Indigent Blind at St. George's Circus. This spot was originally called St. George's Fields, and attained a certain celebrity as the place where the followers of Lord George Gordon assembled in 1780, preparatory to marching upon Westminster. The present building dates from 1834, and was designed by the late John Newman. It is long and low, pleasantly proportioned, and broken by two excellent and picturesque towers. Standing at the junction of two thoroughfares, the site has been cleverly utilised; the low elevation consisting of two small storeys spread out to such a length speaks of 1834—when there was less pressure of population upon land; many a modern architect would be glad to have such freedom for his plan. The structure is noticeable only for its towers, which deserve a word of description. The salient angle is occupied by a vaulted gateway with a slightly flattened Tudor arch; a large oriel window is over it with a small ornamental parapet; the detail is everywhere good. Halfway down the long flank of the building is another gateway and tower, the latter broken by a high narrow oriel of pleasing design. The whole building is doomed to make way for the new electric railway from Baker Street to Waterloo, and the only question is whether the pretty Tudor tower and gateway at the angle of the building could still be preserved and utilised as an entrance. A station entered by a vaulted Gothic gateway under an oriel would be a pleasant novelty in South London.

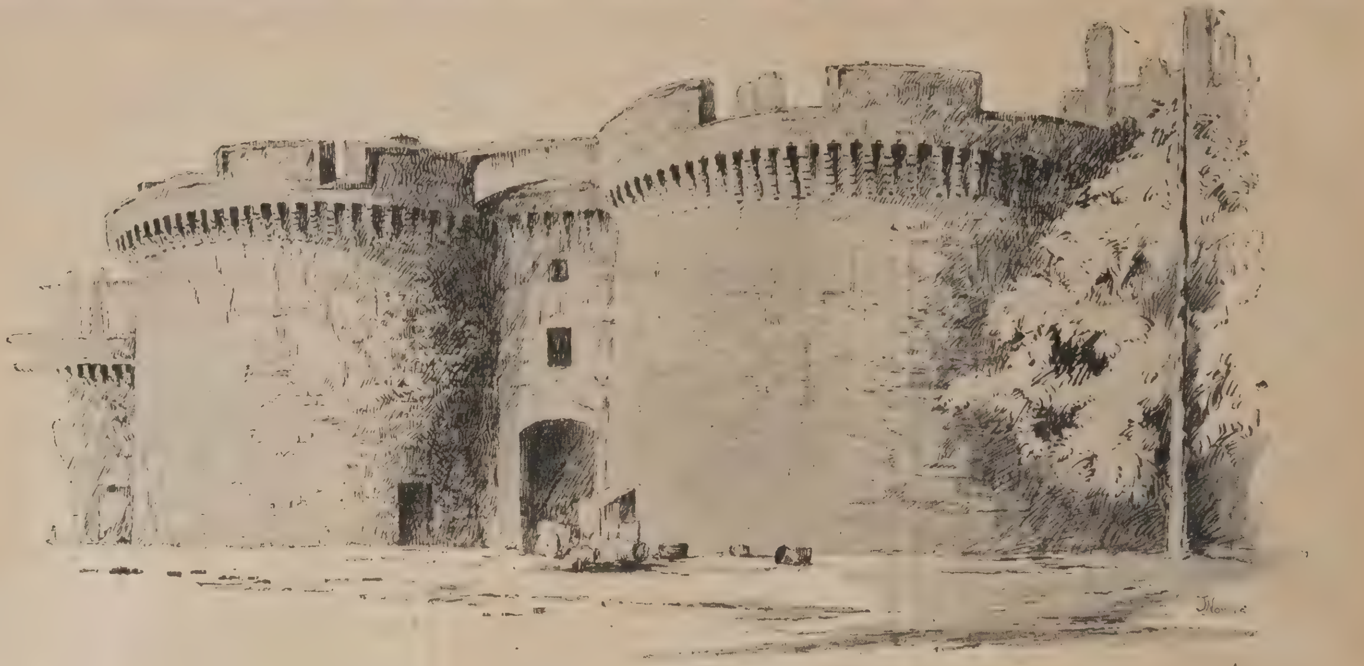
The Pediment. IT is difficult to state exactly the derivation of the word "pediment," but it most probably comes from the Latin *pes, pedis*, a foot—as ancient pediments were often finished at the crown with a statue or ornament. But, whatever be its true derivation, it was always considered as an important part of the building it embellished. At the present time it often receives no such consideration. It is treated as a separate feature, and instead of forming part of the architectural scheme we see it stuck on the eaves in the most distressing manner. It is generally broken at the top to receive some kind of "pepper-pot," and, to aggravate its incongruity, sometimes needs to be supported by an iron stay fixed in the roof! Buildings are not meant to be looked at from the front only, though by the practice referred to one would suppose such to be the case. If the intention is to secure a pleasing skyline, it certainly fails—rather it gives the building a top-heavy appearance, and the pediment itself looks as if it could be pushed off with little trouble. Examples of this manner of building are plentiful in our streets. Seing how a pediment proper may be made to give such a finish to a front, what a pity that it should be replaced by these wretched make-shifts!



OAKHURST FERNHURST FOR MRS CHESTER
C F A VOYSEY ARCHT
1900

(*See page* 44.)

Colour in Streets. THE tendency of modern life is to banish colour, especially warm colour, from our midst. A modern crowd, that is a crowd of "men only," is mainly black, grey or neutral tinted; the appearance of a populous street at midday is the same, and very few articles for outdoor use are of any but the soberest hue. The interiors of our dwellings exhibit the same tendency, and although the black groundwork for carpets, black furniture in dining-rooms, and "sad colours" relieved only by sage green which were fashionable eighteen or twenty years ago have been superseded by something more cheerful, the rule of modern life is still to distrust colour, to introduce it only as a relief, and very sparingly. Gilding—that is, gold as a colour—plays but a very small part in systematic decoration: which of our new buildings has a Golden Gallery like Hatfield, or a Gilt Room like Cobham Hall? In the last century our streets were full of colour; the present age began with the introduction of low-toned colouring, if colouring it can be called. The red-brick revival, and the use of tiles and terra-cotta may be looked upon as a protest against dinginess and colourlessness, as an attempt to revive colour in our streets, but in the ages of warm colouring it was universally applied together with ornament to every object that admitted of it. A little warm colour has been used of late upon houses with stucco fronts, often very happily, but yet with a sparing hand; chocolate seems to be the favourite hue in these cases. A square with none but stucco fronts would seem to admit of a beautiful system of painted decoration *if treated collectively*—that is by arrangement and combination among the inhabitants—but where are such artistic and public-spirited inhabitants to be found? The revival of colour as a part at least of architectural effect is much hampered by public ignorance; as usual, popular "art" has rushed from one extreme to the other; where once stood a quiet old-fashioned house with a moderate area of shop-window on the street level, we have a staring pile which, not content with red brick and freestone dressings, must needs be decked out with polished marble, an enormous metal sign, great lamps, brightly-coloured tiles, and, at night, a vast transparency for a vulgar advertisement. The main thoroughfares of London exhibit much of this tinsel, and even in buildings where some knowledge of architecture is evident several materials of different colours are often found most unpleasantly combined; Peterhead granite polished like glass, bricks of a loud red, and lemon-coloured terra-cotta are not perhaps the only materials used in a single design; the whole picture is irritating; better the sober Palladian of a hundred years ago than such a crude mass of colour. One of the worst examples of the ignorant use of colour is to be seen just now in Waterloo Place. It is one of the few streets in London symmetrically designed and depending somewhat upon columns for its appearance. But the architectural effect of columns in all ages has been, and was always intended to be, that of vertical lines of light against shade; here this has been deliberately reversed, for whilst the background of wall is a light cream colour, the columns have been painted a particularly ugly chocolate-brown; the result is something extremely displeasing. It spoils one of the few fine streets which we possess.



ST. MALO : LA GRANDE PORTE.

ST. MALO.

BY F. H. CHEETHAM.

THE man with the sketch-book and the rod, whose time in northern France is limited, naturally devotes that time to the rich treasures of Normandy and the Ile de France. He may stray westward as far as Mont St. Michel, but he does not generally go into Brittany, unless he is seeking the picturesque as well as the architectural. The artist and the holiday-maker know St. Malo better than the architect. The novelist, too, has found it out, for the sea-girt city forms an admirable background for romance.

The place exercises upon you a strange fascination that is not at first easy to account for. After visiting St. Malo you feel that you have been looking upon a town such as you have not seen before. Wherein, you ask yourself, does it differ from other towns—towns perhaps that boast of older and more magnificent buildings, and more full of historic interest?

The secret, I think, we can discover in the fact, so well described by Mr. Douglas Sladen, that St. Malo, more perhaps than any other town in France, has preserved the appearance of a mediæval city—and this in spite of there being very few of its buildings, as we see them to-day, that date from mediæval times.

"Those who have seen St. Malo from the sea at early morning or sunset," says Mr. Sladen, "with its huge grey ramparts surmounted by huger grey houses, and the whole capped by St. Malo's one spire will never forget the sight; for looking upon it they see a city as men saw cities in the Middle Ages."

Compare Rouen with St. Malo. The architectural wealth of the one is in such violent contrast with the architectural poverty of the other as to well warrant the student-holiday-maker giving the City on the Rock the cold shoulder. Rouen bristles with mediæval buildings, yet in looking down from the heights of St. Catharine we do not see a city as men saw cities in the Middle Ages. Besides spires we see tall smoking chimneys, and when we go down into the streets we find Necessity and Progress have spread far beyond the walls of the old town. The walls have disappeared, making way for broad and handsome boulevards. The city is pierced from north to south by wide streets, which, however much the artist may regret them, are none the less necessary if the work of Rouen is to be done efficiently and well. Big steamers lie moored at her quays, and commerce reigns and makes of Rouen a modern city, despite her picturesque clinging to the past.

Walls may be built round a city, but as times change and more room to live in is needed, the city spreads outside the walls, whose protection it no longer needs. Where can we find a city contained to-day within the same limits as in the Middle Ages? St. Malo is almost one such city. As far as appearances go it is such a city, for if it has been enlarged from time to time, this was either before the present walls were finished, or else they have accommodated themselves to include the added area. St. Malo being built on a rock in the sea—joined only on the north-east corner to the mainland by a narrow isthmus—has never been able to grow much beyond her ancient limits. She stands to-day a sea-girt city, much as she must have stood for hundreds of years, and as she will probably stand for hundreds of years to come. All around her, at Paramé, at St. Servan, at Dinard, the world may advance, may be as intensely modern as ever you please (indeed, just outside her own walls, on the sands, St. Malo herself is very up to date, and has built herself a Casino under the shadow of the Castle), but within her walls the city preserves all the characteristics of the days of long ago. Everywhere we come across splashes of colour and picturesque fragments that bring joy to the heart of the man with the sketch-book who doesn't bother with the rod.

But it is from the sea that the impression of St. Malo as a mediæval city is strongest. It is a favourite excursion in the summer time to sail over from Jersey. You can return next day, or, if you like, you can have a three days' tour in France, going on from St. Malo to Mont St. Michel, or to Dinan, and work round by Avranches to Granville, and thence back to Jersey again.

As you approach the old sea-birds' nest—the city that gave birth to Jacques Cartier, Duguay-Trouin, Robert Surcouf and Labourdonnais—you can at first scarce distinguish it from the neighbouring towns on the mainland. Far away on the left as you near the mouth of the Rance you may distinguish the conical mass of Mont St. Michel showing blue on the horizon. As you draw nearer to the coast St. Malo begins to detach itself. You sail round three sides of it, and land on the quay that faces south. It is all very perplexing unless you have a map with you, or have been before and know the lie of the land.

From the sea St. Malo's solitary spire looks very mediæval. But it is not. The ramparts and gates remind us of the battle and defence of the age of chivalry. But we are again deceived. For Joanne tells us that the walls were designed by Vauban, and built at the beginning of the eighteenth century. And so our guide-book disillusions us. In this short article there can be no attempt at giving a description of St. Malo, or relating its history. For those who seek information there are always the guide-books to refer to, and as a supplement to these there is Mr. Sladen's very admirable little volume "Brittany for Britons," from which I have quoted. Mr. Sladen draws largely from Joanne and from other French sources, especially from M. Harvut's interesting St. Malo guide.

Still, despite the rude shock to our mediæval hopes, we find St. Malo, in all respects but in date and detail, a city as men saw cities in the Middle Ages. The castle, however, can boast a respectable antiquity. It stands at the head of the isthmus, and must be passed on entering the city from the mainland. Its most ancient part—the old keep, called the "grand donjon"—existed before 1378, but the greater part of the castle dates from the days of Anne of Brittany, being commenced about 1475. Before this time, it must be remembered, Brittany was a Duchy independent of the Crown of France. The Duchess Anne, by her marriage with Charles VIII., united the Duchy of Brittany with France, and "lost her sovereignty by becoming a queen." The Malouins did not like the building of this castle at their gates, holding the city as it were at its mercy, and their complaints reached the ears of Anne. She accordingly had inscribed on one of its towers the words: "Qui qu'en grogne, ainsi sera, c'est mon bon plaisir" (whoever growls at it, thus shall it be, it is my pleasure), and to this day the town is known as the Quiquengrogne.

The cathedral is a building of not very great interest. Since the Revolution there has been no bishop, and I sometimes wonder whether it has any right to be called a cathedral at all. On the plan of St. Malo in Black's Guide, it figures as the Parish Church. It is situated in the middle of the town and part of it dates from the twelfth century. The choir and chapels belong to the fourteenth and fifteenth centuries, but the greater part of the nave is Renaissance work of the sixteenth century. The façade was rebuilt in 1713. The tower belongs to the fifteenth century, and until 1859 was without a spire. We can hardly imagine St. Malo to-day without its stone flèche, but it was by a mere accident that it ever came to possess it. At least, so the story goes. Napoleon III., in one of his tours in this part of the country, visited Dinan and St. Malo. Both towns are in the Department of Ille-et-Vilaine. At Dinan is a church dedicated to St. Malo. It lacks a spire. Napoleon noticed this, and on his return to Paris sent a sum of money to the authorities of the Department with instructions to complete "the church of St. Malo." But he forgot to state that it was the church of St. Malo in Dinan which he meant, and so the spire was put on the wrong church. But it was a mistake that few will regret.

The ramparts are the great attraction of St.

Malo. They form the principal promenade of the town, and from them magnificent sea-views can be obtained. The scenery at the mouth of the Rance is strangely beautiful, and St. Malo in the flaming sunlight of a summer evening is a sight that does not soon fade from the memory.

Behind the ramparts rise the picturesque eighteenth-century houses erected by the East India merchants. They are built of granite, with high-pitched roofs and lofty chimneys. "Unlike most French houses," says Mr. Sladen, "they have no lattices; but they have double windows to shut out the draughts of Atlantic storms, and the outer windows folded back on the walls give a fine effect at sunset."

Inside, the city is full of old houses of the sixteenth, seventeenth and eighteenth centuries. In one of these was born Duguay-Trouin. It is a house much prized by the Malouins—an old wooden house of four storeys, the uppermost of which projects and has a continuous window across its entire breadth. There are plenty of these picturesque old timber houses in St. Malo, though the principal dwellings, those, for instance in the Grande Rue and facing the ramparts, are built of granite. Colour is given by the window flowers, the dresses and uniforms in the street, and the fruit and vegetables in the shops.

So we can make pictures at St. Malo even if we do not care to fill our sketch-books with measured details. And we can do more. We can take in something of the atmosphere of long ago; that is, if we are not too critical, and will allow full play to our imagination. We can pay literary pilgrimages to the birthplaces of Chateaubriand and Lamennais, and, if in a romantic mood, we can meditate over the island tomb of the author of "René." Then, shutting our eyes and ears to the gaiety of Dinard across the water and to the reminders of our own days closer to, we can put out to sea, and there, for a brief moment, can persuade ourselves that we are indeed "looking upon a city as men saw cities in the Middle Ages."

THE ARCHITECTURE OF THE TWENTIETH CENTURY.[*]

BY BANISTER F. FLETCHER.

TO transport oneself into the middle of the next century requires perhaps more imagination than an architect in everyday practice has at his command, but it is interesting and perhaps instructive to try and think out the problems which are likely to harass the architect of the coming century and to picture in our minds how he will solve them. The following remarks are therefore necessarily speculative, because I am breaking away somewhat from the hard facts of the present and dealing with what may come to pass, say, fifty years hence. Our subject is the architecture of the twentieth century.

General Considerations.

Perhaps it will not be unwise to put the question to ourselves, What is architecture? The answer to the question is really that which we shall give as the result of our imagination for the coming century.

Architecture is the result, the record of civilisation, the permanent expression of the people, the great recording angel who writes on indestructible granite the manners and customs, the very lives of the people in whose times such architecture is carried out.

Let there be no mistake in this, that architecture in this respect is as true now as it was in the times of the Egyptians, Assyrians, Greeks, Romans, or Mediævalists. Then as now it records our lives, our civilisation, our mental and social conditions as truly as does any mirror the man who stands before it. It is evident that since the Renaissance the record is more subtle, the pictures are less clear, but that is because our civilisation is more complex and our methods more obtuse. When architecture ate of the tree of knowledge in the fifteenth century, and seized upon the outspread manuscripts and splendid structures of old Rome, she was doing something which until then was an unknown quantity in the world of art. Architecture until that time had been the spontaneous growth, the natural unbidden fruit of a tree planted on various soils, and hence bore varied natural fruit, the result of such planting. In the fifteenth century, however, such a natural cause of growth was abandoned, and architecture, so far as outward form was concerned, went back like a bow unstrung to the ancient forms of classic times. In other words, the revival of the learning of the ancients tended to produce the revival of the forms extant during the period of the Greek and Roman ascendency. And so it must always be. Architecture is made by the people, and *nolens volens* it must bear the impress of the people's mind, although at the time this be difficult to discern.

Placing aside for a moment the new types of structures demanded by succeeding generations of men for their use, let us glance at the ever-recurring question of style in architecture and see if we can picture that style of architecture which will be paramount in the dim and distant future.

Of one thing we may be certain, I think, and that is, whatever style in architecture may be in vogue, Classic, Mediæval or Renaissance, it will be so adapted to the needs of the people that its form will be to all intents and purposes new. We shall be spared the absurd and pedantic Greek temples which were erected as dwelling-houses at the beginning of this century, or later the lath and plaster Gothic palaces which were to transport us back to the Middle Ages. The world is now too matter-of-fact and too much addicted to reviewing buildings from the practical and sanitary point of view to suffer such chicaneries.

Fashions in architecture we shall have, as we have fashions in ladies' attire, or, for that matter, in men's garments; but we can safely predict that convenience in planning will not be sacrificed to outward form, and that the sizes of our floors and windows will not be subordinated to anything but our requirements and convenience. Beyond that we may strain our eyes in vain along the architectural horizon in search of an advance copy of the style which will prevail. And this the more so because we must look unsuccessfully for new forms unless we have new materials which will evolve such forms. It must be remembered that we are using in our architecture the materials that the Romans used; and although the difference is great compared with Roman architecture, yet it is comparatively small when the distance between the one and the other is remembered. It is only by "ringing the changes" on the various architectural forms and features that we can see the future of architectural design. I think it was Lord Eldon who said that architects and lawyers were the most conservative people in the world. Perhaps his lordship did not remember that both Roman law and Roman architecture had reached a perfection of completeness beyond which it was difficult to go, and that therefore what appeared as conservatism was merely the inability to go further. Certain it is that architecture, like language, is a structure built up of certain well-known forms or letters. Now in language it is not necessary to alter the number or names of our letters to produce nineteenth-century literature. Tennyson and Shakespeare use certainly the same letters and also largely the same words, yet one is not a copy of the other. The same in architecture. Because once or twice in the history of architecture there have been revolutions in form, as from Classic to Gothic, and Gothic to Renaissance, people have come to expect what they call a new style in architecture every century or so; but such a thing is unlikely. It is in the putting together of various features that new phases in architectureal art are introduced, and not by wholesale destruction and invention of new ones. To tell the truth, such invention is well-nigh impossible, for if we take such homely instances as a door, a window, or a fireplace, it is impossible to alter much the form of either as long as the size and position of the same remain similar and appropriate.

Thus architectural style will probably not vary much from the Renaissance form at present in vogue for public buildings, or the Gothic for ecclesiastical buildings. But whatever form is current there is no doubt that freedom—almost license—will be paramount. Such is the spirit of the age; thence the architecture will reflect such spirit. We need, I think, expect no more revivals. Architects will be honest in this. The attempt to foist imitations of another century, as in the Greek and Gothic revivals, will probably not recur; but design will travel along the smooth line of careful inventiveness without any revolutionary tendencies. But in any case, as we shall see later on, difference in the needs of the people will produce buildings new in form and outline, if not of necessity largely so in architectural detail.

It is the age of the democracy, and the buildings of importance, such as the libraries, public halls, &c., will tend to show the turn of civilisation in these constructions.

If there is one thing more in evidence and

ST. MALO: THE CATHEDRAL.

---

[*] A paper read before the Birmingham Architectural Association on February 8th, 1901.

likely to be so than another it is the complicated and intricate planning which many modern structures require. I shall refer to these later, but it must be apparent that these structures are quite modern in feeling and form, and that little of their character has been seen before. It is true that during the great Roman period of architecture emperors vied with each other in the erection of public baths for the people, but these are isolated instances erected as a bribe to the populace. From the plan of a building is developed its general form; from the junctions of its various parts are evolved its exterior; and as the various types of buildings alter so does the architectural elevation vary with them.

But before I pass on I must refer to the science and profession known as engineering, which, formerly in the architect's province, has now quite dissociated itself from its elder sister. There seems no doubt that to posterity the great engineering structures of the day will appeal as essentially of this century. Such works as the Forth Bridge, the Eiffel Tower, the Tower Bridge, the Brooklyn Bridge, and many others are essentially new in form, born of a new material, steel, which by necessity has evolved forms quite new in the world of design. The number of such works will no doubt be largely increased, and the twentieth century will probably be known as the "Steel Age." It is only to be hoped that the hideous structures perpetrated under the name of engineering will be improved in outward appearance as they could easily be by engineers being trained together with architects in their early studies. In France great engineering structures of this kind are often designed jointly in the manner indicated above, and this has been followed by very encouraging results, as at the Paris Exhibition of 1882. As far as civil architecture is concerned, there is little chance of the use of steel superseding that of other materials.

Steel is not suitable for forming the walls of our houses: it is a conductor of heat, it is used in thin lace-like shapes, and is quite unsuited to keep out heat, cold, or the elements. Hence, although it is sure to be used for large engineering structures or in isolated cases demanded by peculiar conditions, as at Chicago, it is not likely to be a factor in the evolution of architectural forms *per se*. Its increasing use however, to make house roofs of large span will tend to alter interior architecture considerably. Instead of the ponderous wooden roofs erected in the past, a light steel framework, covered with plaster in coffered parts, is likely to be largely used. The lace-work design and construction of the ribs prevents any necessity for tie-rods, and thus gives a new element in architectural design, which should produce a new treatment.

Architecture and Public Health.

It is admitted that architecture consists in the designing of beautiful buildings suitable for the special purpose to which they will be put, and having therefore the essential quality of fitness.

There can be no doubt that the healthy arrangement of buildings has much to do with architecture in its highest sense, and considerations relating to the health of the occupants of buildings affect the form and structure, and therefore the expression, of buildings. In the coming century this will be even more distinctly the case, because there can be no doubt that the principles of sanitary science will be more strenuously sought after and more rigidly applied.

It might be argued that beautiful buildings are not necessary to health, but I maintain that to live among beautiful buildings set in well-designed streets does help to a healthy condition of mind. Paris as a city is perhaps too stereotyed in its architecture, too stiffly set in the framework of her streets; but one never visits it without feeling mentally in a beautiful atmosphere, which is of course sometimes counteracted by the unmistakable signs which seem inseparable from Continental cities—that the system of drainage is not quite perfect.

Environment.

I am stating an admitted truth when I say that environment is a great power, a great factor, in the formation of character and in the general well-being of any community. How can we expect the gutter children of London to grow up as good citizens, as honest, sober and manly, when they pass their lives in the filthy atmosphere of a London slum, with a square of dirty pavement for a playing space, and with a gin palace for a background? We might as well try to get blood from a stone as citizens healthy in mind and body from such a nursery.

Slums are to a certain extent being exterminated; but, if I judge the future aright, we are only at the beginning, and by the middle of the coming century municipalities will have agreed that slums are as dangerous to the community as unhealthy drainage, and that light and air and plentiful sunshine shall find an entrance, as far as possible, into every quarter of our ideal city. What more can we look forward to than beautiful buildings filled with light and suitably built from a sanitary point of view, set on to broad streets so aligned that the sun's rays can penetrate during the greater part of the day?

So much then for the element of fine art in regard to the house proper and its frame, the city beautiful which I contend should be considered in relation to health arrangements.

Further, the architectural conception of life is what we want, the idea of one controlling spirit guiding all others for the common weal and producing works of beauty, forming part of a general progress, the same kind of co-operative labour which resulted in the erection of the Parthenon and the Mediæval cathedrals.

Sanitation.

We may spare a few moments to speculate on the construction of houses in the new century dealing with the subject—(*a*) from the point of view of plan; (*b*) from the point of view of construction; (*c*) materials; (*d*) ventilation; and we may well preface these remarks with a suggestion for the necessity for a Minister of Public Health (assisted by a committee of experts). Such an appointment is necessary in order to codify the enormous amount of literature on the subject and to place the carrying-out of the Acts (if neglected by local authorities) in the hands of those who will not be under local influence, and who will have power to enforce the law. I shall touch upon this later when I come to consider the smoke-abatement nuisance.

(*a*) Sanitation or public health will be the watchword of the new century. Pure air, pure water, pure food, pure soil, clean dwellings and clean bodies will constitute the well-being and strength of a nation.

The more efficient sanitary arrangement and construction of our dwellings has been advancing steadily during recent years, and lectures and treatises galore have been delivered and written on this most important subject—yet how much remains to be done to render our dwellings in a sanitary condition. By the more general teaching of hygiene people may be expected to see more clearly the necessity for a soundly constructed dwelling whereby doctors' bills may be avoided and a more efficient day's work performed by the occupants.

If we consider how often the ills to which flesh is heir are due to badly planned and constructed houses, it does seem startling that any one is entitled to call himself an architect and be responsible for that most important of sciences—the planning of buildings. But this will be referred to later.

The advance in the system of planning buildings has been considerable in recent years, and no longer are houses arranged with the sanitary apartments ventilated on to the staircase or passage. Yet this was a common practice in the past, and there are numerous houses in London on the great landlords' estates where such things exist even now.

(*b*) *Construction.*—In the twentieth century certain anomalies in the construction of houses, it is hoped, will disappear. Amongst the most notable of these are the spaces specially provided by architects for the collection of filth, for the storage and breeding of vermin and the dissemination of disease. I refer in particular to the time-honoured method of constructing the ordinary combustible timber floor. It is useless lecturing on sanitary science while such a harbour for dirt is erected in almost every house. Washing such a floor possibly only makes matters worse, for half of the dirt is washed through the open joists between the floor, and rests contentedly on the laths which support the plaster ceiling below. Our floors must be solid if we would have them healthy. Hollow spaces of all kinds will no doubt be condemned by law in the coming century. Hollow floors, hollow walls, hollow spaces behind skirtings and the like will be things of the past.

Materials.

Since architecture first began to raise herself to the level of fine art, there has been very little change in the materials used in the erection of buildings. Stone, brick, concrete, marble, terra-cotta and wood have been the materials at command, and, although the manner of working them has varied, this has been brought about largely by the social condition of the period. In the twentieth century we can dream of no fresh addition of any material which is likely to revolutionise form. Steel we have already at our disposal, but one can hardly imagine that in works of pure architecture it will ever oust the older materials, although it has almost completely done so in the domain of engineering.

The use of wood in buildings seems likely to be less and less adopted in interior fittings, and it is doubtful whether many good substitutes for it may not be found, especially in such parts of a building as *floors*. This is foreshadowed for us in the construction of modern hospitals, where the floors are in most instances made of some non-absorbent material of a concrete nature, which can be thoroughly cleansed. In some modern buildings which are not hospitals this method has been adopted. In the Great Central Hotel, London, there is no wood used except for doors and windows, and there is really no reason why any architectual features except doors should be in wood. In the hotel mentioned the floors are of steel joists and concrete, the upper surface covered with mosaic, and the skirtings, which in most houses are of wood, are of cement, instead of the objectionable wooden skirting behind which are the usual dirt-traps. It does not seem that expense stands much in the way of the adoption of solid concrete floors, and the latest decision of the London County Council permitting fireproof floors to be constructed of fir joists and concrete has much reduced the cost of such work. One element of inflammability is therefore done away with, besides placing the building in a much better sanitary condition.

For all buildings the tendency is to cultivate the use of fire-resisting construction, and there can be no doubt that this will be greatly extended in the future.

Ventilation.

Ventilation, in general, will no doubt proceed on lines of general advancement, but except in public buildings nothing that could be called mechanical ventilation will be attempted, the expense of such systems being too great. In theatres, music halls, public assembly halls, churches, &c., it may be confidently asserted that great improvements in the proper provision of pure air will be effected.

It certainly does seem a curious thing that although the science of ventilation has passed the preliminary stages, and may now be said to be an exact science, yet the amount of air necessary to be pumped into our meeting halls and churches is not regulated by any Act of Parliament.

It would therefore appear that the Legislature does not believe fresh air to be a necessity to existence, or even to good health, although it may be observed that the Houses of Parliament are probably the best ventilated buildings in the land. Our Building Acts and Public Health Acts regulate the construction of buildings and provide in special cases for a certain amount of cubic space per person, but as regards the ventilation of public meeting halls they are practically inoperative. The improvement which may be expected to accrue to the health of the community at large by breathing fresh air, properly warmed and admitted without draught, when crowded together in large numbers is not to be over-estimated.

It is certain that such provisions cannot be much longer omitted from the Public Health Acts, and the present disgraceful condition of our public meeting halls will then be altered for the better. We have been termed "a nation of shopkeepers"; but I think a more appropriate term, at least during a certain proportion of the day, would be a "nation of lookers on"; and I am bound to say that I think this national characteristic—which, be it said, we hold in common with other nations—will extend. The increase in the numbers of theatres, music halls and concert halls which will be erected to supply this demand will probably be very large, and even the small provincial towns may be expected to be provided with such buildings, properly ventilated according to the latest sanitary knowledge.

Garden Cities.

The city beautiful. Is there in the whole of Great Britain a city which might be called beautiful? Some approach beauty, but there are foul blots in most; slums, badly-constructed tenements and insanitary factories, which spoil the picture. What can we say of the heavy pall of thick black smoke which hangs over London, and to a much greater extent over the manufacturing towns of Northern Britain? Is that a subject of gratification to our municipalities or a matter affecting the public health which should not be remedied? I believe I am right in saying that laws do exist which prohibit these monster belching chimneys from fouling God's air and blackening the earth, but that these laws, from local influences, are often not put into force. The open fireplace it will always be difficult to dispense with, owing to associations connected with the domestic hearth; but important improvements in its construction are already shadowed relating to smoke consumption which will no doubt be enforced on all householders. Personally, however, I am inclined to think that gas will supersede coal for warming the ordinary buildings.

Let us glance at London—London the great, the picturesque and far from ugly capital of the Empire.

Roof Spaces.

In the first quarter of the new century when London, with the assistance of legislative action, may be expected to have shaken itself clear of its smoky curtain, and to have removed a large number of its most offensive factories to a convenient distance into the country, the idea of overhead promenades formed upon flat roofs will probably be brought to the front and found to be practicable. The roof promenade may, in fact, be a feature of the next century, and we shall perhaps return to the usage of the Egyptians and other Eastern peoples. These roof spaces, adequately protected, could be more generally utilised as playgrounds, flower gardens, for tennis and sports generally, or even, as in Chicago to-day, as a space where shops could be erected. If imagination does not desert us, we might conceive a football match on such spaces, with the attendant thousands of spectators. Such roof gardens would have this advantage, that in the summer when fires are not needed for heating purposes, and when cooking will be effected by electricity, the air would be quite free from smoke: they would be more conveniently used. "Afternoon tea" on the roof will probably be the invitation of the future, and with the above suggestion a substitute would be found for a terrestrial garden. Public health would be benefited thereby, for the cool breezes generally obtainable at the height of a five-storey house with a view from the Highgate heights to the Surrey hills would be a blessing to the jaded office worker. I only mention this as showing the possible effect of public health problems on architecture, because the advantages of level roofs are admitted, and it is possible that when the way is cleared by a better atmosphere the great cities, owing to value of land and increase of population, will wake to the advantages which they now miss, and a third London will appear on the house-tops, as there is already a second beneath the surface.

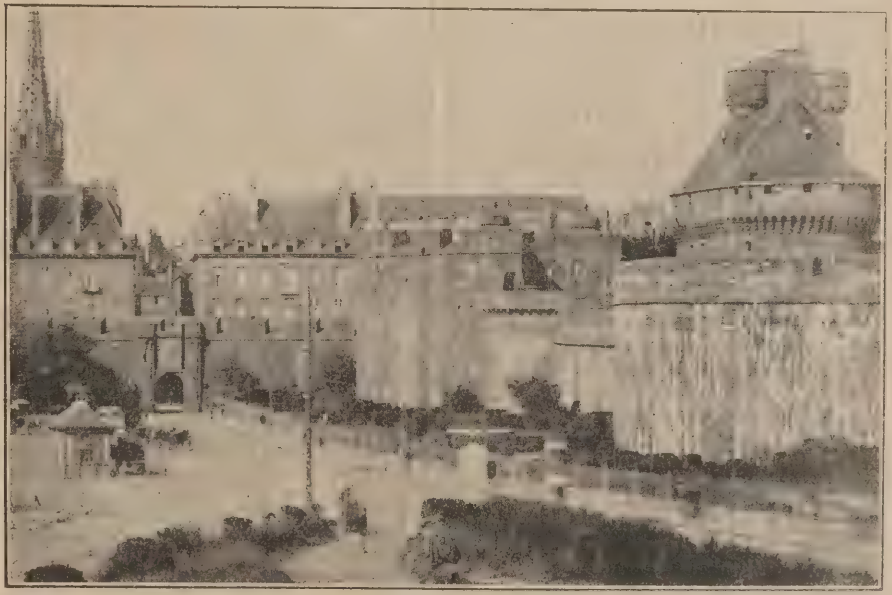
Time will not allow me to pursue further the fascinating subject of the future city; we must pass on.

Domestic Architecture.

In approaching domestic architecture one is met on all sides with so many "ifs" that the difficulty is to proceed at all. What is to be the civilisation of the next century? Is it to be socialistic—the levelling of the rich—or is it to proceed on the lines of the present day? Will the people rush from the towns to the country, or *vice versâ*? It is plain that the railway, the cycle, the electric tramway and the new "flying machines" will quite as much tend to throw the people out of, as into, the great cities. It would certainly seem that with improved methods of communication there will be a tendency to live out of towns and work in them—for those at least who are able.

It is considered now somewhat a feat to live at Brighton with one's business in London; but we may take it that such a thing will be quite common, and that by the middle of the century a man may possibly go much longer distances. Domestic architecture will be governed very much by the course which easy transit develops, and such being the case the health of the community will no doubt be improved by the placing of people over a wider area of ground.

But besides easy transit, telephonic communication and the new science of writing by wire known as the telautograph will have an important effect on the distribution of population, and hence on the health of the community, and it is not unlikely that the trend of events will enable us to carry on our practices "far from the madding crowd." As an instance I call to mind how some years ago in the United States I visited a village ten miles from Boston, where the most celebrated landscape gardener in the United States lived, and where he worked with his assistants on his designs.



ST. MALO: SQUARE AND PORTE ST. VINCENT.

Being in telephonic communication with Boston, and thence with other centres of population, he and his staff had the advantage of being in direct communication with his clients and at the same time of living in the country, with all the advantages of fresh air and congenial surroundings—an environment which we must admit is conducive to the production of the best work. Such is an ideal state for an architect, and it needs no great stretch of the imagination to conceive its possibility. But even if we must work in cities, it is certain that, with improved means of communication, the dwelling-house will be the better for being removed from the environs of the city.

If there is one class of building which has improved in design and construction during the last fifty years it is the smaller house of the suburbs and provinces. It is true that streets of houses are still erected in the suburbs by speculating builders, but it is possibly a hopeful sign of the times that whereas formerly such houses had no pretence to be designed in a sanitary manner, yet now in many instances they are so designed, and an endeavour is also made to give them a pleasing architectural exterior, which is, of course, very seldom successful—still the attempt is encouraging. The drainage and sanitary fittings are now boldly advertised and placarded, even to the great luxury of one bath, with hot and cold water. Other alluring enticements are held out to the future occupier. In one house on the outskirts of London which I recently had occasion to visit a plan of the drains, engraved in red lines on a brass plate, was prominently fixed to the wall by the kitchen dresser. It is needless to say that after such a display of careful sanitary forethought the house was immediately sold, and I give the suggestion to anybody with a house unlet on his hands as a prescription by means of which the desired result may be attained. It is, moreover, a hopeful sign of the times.

Although long unlovely streets of dwelling-houses are still erected, all cast in one mould, and people are obliged to live in them, there is a decided move towards a desire to live in a house with some character about it which shall differentiate it from its neighbours. Will this tendency increase and will such houses multiply, or will the desire die out?

I must be permitted a few words on this important subject, because I really think it is connected with the idea of public health in its widest sense. A house which is to be a home should be made to suit the occupant in the same way as his clothes are, or should be made to fit him. A man should not, if he can help it, stuff himself into any house haphazard. The growth of individualism in taste is certainly manifest, and the greater interest taken in ordinary art matters by the coming generations will possibly not be lessened. But although the country dwelling-house will possibly increase to a considerable extent, yet there must always be a considerable number of dwellers in cities, and their lot in the garden cities already foreshadowed should be of comfortable character.

Where will they live, and how?

The twentieth-century "flat" will be a creation of its own; something to make the lonely bachelor of to-day sigh for. Everything will be able to be "turned on." I do not know how long we have been able to turn on water in our houses, but it must have been considered an immense advance in sanitary science and must have done much towards the attainment of that personal cleanliness which has been considered by some experts as next to godliness. Besides turning on water for washing, gas for heating, electricity for lighting, the liver in the flat will press a button for breakfast, lunch, or dinner, and somebody will do the rest, *i.e.*, will supply it.

By the pressure of another button the "babbling machines," described in "When the Sleeper Wakes," will be turned on and will tell the worker while he eats his breakfast the morning news, supplied from headquarters. People will be too busy to read newspapers in the coming days.

The life in a flat will be socialistic, yet exclusive, for although the *ménage* will probably be undertaken by one person for the benefit of many, yet the result will be available privately. This life is already shadowed forth in the United States and in London, and there seems no reason to doubt that it will become very general among the class of people who will inhabit such buildings.

The great domestic-servant problem is going to account for a good many things in the coming century; amongst others we may expect the multiplication of fittings, such as lavatory basins with hot and cold water in each bedroom, the use of gas fires for heating, the more sanitary arrangement of servants' quarters.

In how many houses of even fairly good size are there servants' bathrooms? Yet surely our successors will look back upon such a state of things with wonder.

The Working Classes.

We often used to hear about "better days for the working people," and no doubt better days have come. The Rowton houses, the County Council lodging-houses, and the immense blocks of flats already erected in London are but the precursors of other big schemes which will certainly be pressed forward as population increases. This is, perhaps, one of the greatest public health problems we have to face. It is, moreover, so wrapped up in our commercial system that much will depend on the way that manufacturers regard it.

Will the factories be removed to the country, or will they to a large extent remain in the towns? Personally I am inclined to think that a large proportion will go to the country, and that only a few will from their nature probably remain in the towns.

Let us picture

The Country Factory.

The country factory with the cottages for the employés is an excellent idea, and one likely to give the best results to employer and employés.

The employer will construct his factory on land comparatively cheap, and by providing his workmen with house accommodation, also at a low rent, will have at his disposal a contented community, living largely in the fresh air who, being under healthy conditions, will give better results than the town worker, crowded into compartments necessarily small because of the value of city land. The growing families will also have the inestimable advantages of fresh air and country life. Some of the large manufacturers of the North have already tried this plan with good results, such as Messrs. Hartley, Lever and Cadbury, and new villages with the latest sanitary improvements both in the planning of the cottages and in the abundance of light and air and tasteful surroundings have sprung up.

If such schemes should prosper we may look forward in the new century to a return of the people to the country, whence of late years there has been such an exodus, and the improved means of rapid communication already foreshadowed will assuredly assist in such a return.

Peoples' Palaces.

On the other hand, if the study of economics should compel the abolition of the present wasteful system of living—the multiplication of fires for warmth and cooking, the waste of service, the extravagance of buying food in small quantities—then it is possible that the erection of country palaces for the people on socialistic principles will be promoted. Such palaces, with proper equipment, could supply all the needs of the community as to food, service, &c., at probably a quarter the cost of the individualistic cottage treatment.

Each palace would be contained in its own park, with lakes, playing grounds, &c.

Such a building—a real peoples' palace, a twentieth-century homestead—may be beautiful, although in the minds of many not so picturesque as the simple thatched cottages of our forefathers.

At any rate, the old dark and damp cottages of the present period, devoid of a proper water-supply, will soon sink on their rotten foundations; the educated working classes of the future, who will know the evil effects of damp, will refuse to live in them, and they will be replaced by structures, dry, well-planned and lighted, with proper water-supply and drainage and healthily constructed in all particulars.

The old picturesque "lichen covered" thatched cottages which we eagerly pounce on for our water-colour sketches are, we may rest assured, more pleasant to sketch from the outside than they are to live in.

Before returning to the town-dweller we must spare a moment to discuss the scarcity of rural cottages which at present exists. It is a feature of this period, and the reason is that it is almost impossible to erect cottages which will pay a fair percentage on the outlay. That being so it becomes a question whether some such scheme of communistic living, as hinted above, will not be the outcome of this state of things.

I believe such scarcity is partly due to the present building regulations, which for this class of buildings are unnecessarily stringent. There is no reason why country cottages with proper brick foundations and damp-courses should not be built of wood in the upper part and made perfectly sanitary constructions; it is the usual way of building even large country houses in the United States.

Workers in Town.

But a large proportion of workers must always live in towns; the needs of town life demand it. There is, however, a good deal to be said against these huge blocks of barrack-like buildings which have lately housed so many persons on a limited area, even if the sanitary arrangements are perfect.

The absence of sunshine and fresh air is bad not only for children but also for older people, to whom also a multitude of steps is specially objectionable. The absence of light and air in the lower floors of these huge blocks of flats is especially to be remarked.

Municipal Architecture.

Let us look at a few types of structure which concern themselves somewhat less with the public health and speculate in what way they are likely to be influenced by the progress of civilisation.

The development of municipal architecture will depend, of course, on the view the masses take of their citizenship, and whether they will regard the emulation of the architecture of rival towns as falling within the scope of citizenship. In the past ages such has been the case. From the Hellenic period of Greek civilisation, through that of Augustus, and the Middle Ages, and in the great Renaissance movement of Italy in the fifteenth century, the emulation between rival cities has been the means of producing buildings of the first importance. In our own day the town halls of Glasgow, Liverpool, Manchester, Oxford, Colchester, Sheffield and other large towns have risen in evidence of this feeling, and as if to point the way to the importance of architecture as an exponent of the cities' progress. The stately town, the emblem or visible sign of the harmonious life of the twentieth-century citizen, will be the product of the moral forces of which sanitary science is not the least important.

Municipal buildings are worthy records of a city's greatness, and as the country population appears to be steadily drifting towards the towns, thus increasing their numbers and wealth, the new century may possibly be productive of this result. But whereas in the Middle Ages in England the principal building rivalry often lay between cathedrals, in the twentieth century it will probably be more of a secular rivalry between cities.

As regards theatres, we may expect a great revival of building, which has moreover already commenced. The love of music and the drama is assuredly on the increase and will continue to grow. The late John Addington Symonds, the distinguished critic on the Italian Renaissance, said that music was the only true modern art, the only art which seemed to appeal to the senses in a modern way.

Certain it is that the public generally take a far greater interest in music than in architecture, painting and sculpture. As municipalities expand and increase in wealth, provincial theatres and concert halls will rapidly increase.

In this respect, the piecemeal decoration of the Royal Exchange in London is an example of how not to do it. Instead of the decoration of such an important building being competed for by the best fresco artists of the period, and the prize awarded to the finest conception as a whole, isolated pictures are selected from time to time by eminent artists, the result being a want of continuity of scheme and design, which is unfortunate in its results, instead of the whole series of frescoes forming a continuous picture of English or (say) London history in one general comprehensive scheme.

There is, or should be, an intimate relation between architecture and national life.

Picture Galleries, Museums, Public Libraries,

will become a *sine quâ non* in every provincial town, and in many cases will form part of a group around the town hall, the building symbolic of the executive who will direct the formation of and undertake the custody of such collections.

In London, the "city of cities," the division into separate municipalities will, it may be hoped, engender a broader municipal spirit, so lacking under the old vestry system, and so lead to the erection of appropriate municipal structures worthy of the importance of each, as representing a city in itself.

Public baths and washhouses will be considered as necessary to every town or district as a system of drainage, and our grandchildren will look back with horror at the insanitary nineteenth century in which, although lecturers were continually priding themselves on the advance in sanitary science, local authorities were not compelled to provide facilities for the furtherance of public health.

Properly constructed abattoirs, provided with the efficient sanitary precautions in the slaughter of animals for the purposes of food, will undoubtedly be entirely under municipal management, as in Paris and other large continental cities.

The most significant constructions of the new century will possibly be the monster towering hotels, of which in London we have but seen the commencement. Such will be the expression of the touring, travelling and luxurious twentieth century, the age of big cities, art pilgrimages and personally-conducted parties, the age of the sightseer and the "looker on," the age in which people will feast upon the glories of the past, live in the future, and exist by way of contrast in the present.

Asylums, police stations, fire stations, waterworks, electric works, tramway works, board schools, poor houses and hospitals, all of which are the outcome of our modern social condition, will increase a thousand-fold.

The greater the science of public health is studied and applied, the greater however the chance of the "weaklings" pulling through, and being a charge on the public purse.

The strain of living will increase the number of lunacy cases to an unparalleled extent, necessitating considerable additional hospital accommodation for neurotic diseases.

People will talk of the good old days of the nineteenth century and will fondly believe they would have been happier now than then, and perhaps they would be right.

Within the region of purely monumental architecture can we expect much? Possibly not! The monuments of the twentieth century will be ranked as works of utility.

The great railway stations, properly planned for ingress, egress and the health and comfort of the community, will take the place of the present cramped enclosures.

When in, say, 1925 the "flying machine" shall have been perfected, it may necessitate a reversion to the huge platforms about 50ft. in height and several thousand square yards in area in use in Babylonia 2,000 B.C., and on which the temples and palaces were placed.

Such raised platforms will be required as resting-places for the twentieth-century flying machine; these elevated platforms being reached by lifts continuously moving.

Such platforms will be constructed of steel; the best prototype I can give you being the half-finished Wembley Tower, near London.

In the great constructive science, the bridges of the future will probably be of astounding dimensions, and the new Brooklyn Bridge may be regarded as a forerunner of many which will far surpass it. To bridge from Calais to Dover, and even from London to New York is a far from unlikely occurrence. And yet the thought comes, shall we do without bridges, shall we, with the aid of flying machines, fly to New York, fly everywhere and anywhere? In such cases we may possibly require resting-places at stages in the Atlantic for the lubrication of the monster wings of the flying machine, such resting-places taking the form of the monster steel platforms of the Wembley Tower type, already mentioned.

Am I romancing without reason? It may be so, yet it is not possible for anyone to say these things will not happen. If we look at the strides in every science which have been made in the past century we must feel that if the present is to proceed in a like ratio, not only the things I have sketched for you, but much more also, will come to pass.

A Twentieth-Century Architect.

And if this is a correct view of the architecture of the coming century, what of the architects; of the creators of such work? If architecture in its outward forms has not advanced by any revolutionary stages along the highway of progress, yet in the manner of construction she has and will develop exceedingly. Old Philbert de L'Orme, an architect of the French Renaissance, once said that an architect should have four eyes, four ears and three hands; and if it was necessary then, what now?

An architect nowadays is necessarily skilled in mechanics, several sciences, and in various arts connected with architecture.

Now architecture differs from engineering in one essential quality, that while the latter is a matter of common sense, which everyone understands and therefore can appreciate, the former in its highest stages is based on an appreciation of æsthetic quality which the public can scarcely be expected to understand.

The new century will be a utilitarian and scientific age essentially, and architects will have to adapt themselves more to the requirements of the time and hold less to the antiquated ideals of the past centuries if they are to capture and retain the public interest.

We must be of the twentieth century if we would succeed in it. Therein lies our great difficulty, prevalent in no other profession, for architecture is an art, science and profession.

In architecture we have the artistic requirements sadly hampered by the material needs, and above, dominating those, the professional qualification requiring us as men of business above all things to protect our clients' interests.

The question of architectural education therefore is an important one. The foundation of the Royal Institute of British Architects and the Architectural Association in this century, and the institution of professional examinations, are merely the reflection of the spirit of the age, in which the public require to have some indication that the men they employ are capable, and, in fact, that they are qualified to practise their profession.

This will undoubtedly lead to a compulsory registration for architects, when no one will be allowed to practise without a diploma. To the public it is a never-ending theme of amazement that anybody can call himself an architect.

And truly it is quaint. We cause the men we direct on our buildings to be registered—we have our registered plumbers, our carpenters, bricklayers, joiners, plasterers and masons who have all served their apprenticeship, besides being technically educated, and yet anybody can call himself, and practise as, an architect.

Let us think for a moment of the power for good or evil in an architect's hands, due to his knowledge or ignorance in matters connected with building, and then who can doubt but that this compulsory registration is bound to come.

Opposition has always been forthcoming in these matters. In the law, in surgery, and in medicine, the same well-worn statements have been flung back to those who have advocated progress, and generally this opposition comes from the older men, the relics of a past age, who can see no good in change of any kind.

The only real difficulty is the question of the possibility of examining in art, and as far as the public goes it would not matter if art were left out of the question, for in nine cases out of ten the public employ us to protect their interests, and not to provide them with artistic work about which they know little and care less. The principal thing to remember is that the public expect us to be thoroughly qualified all round, to be directors and experts of all departments of building, and to possess the business qualifications for guarding their interests which are usually associated with the profession of the law.

If a profession or a calling which is employed by the public is to continue to exist there must be confidence by the public, and how are the public to know with certainty the qualified from the unqualified unless some official qualification is available?

Again, a great part of the architect's ordinary practice consists in utilitarian work which requires no artistic talent, but which does require great scientific and practical knowledge and business habits.

We have elsewhere hinted that the guiding star of the next century will be sanitation, matters of drainage, and everything connected with the hygiene of the house with which architects are concerned, and they will no doubt be properly registered to deal with such work.

If persisted in, the present fine-art theory of architecture, held by a few eminent architects who have clients enough to support their fancy, will tend to the gradual absorption of legitimate architectural work by builders or big firms of decorators, who probably will employ a "tame" designer to put a frontal to their stock plans.

In regard to the increasing complexity of our civilisation, the number, extent and intricacy of new types of constructions, it may also be expected that the tendency to specialise will develop itself, although the general practitioner will, of course, continue to hold his place as in the other learned professions.

Such are a few of the thoughts which I have been able to put together dealing with the future of architecture, and although they are far short of what I had hoped to produce, yet in the time at my disposal I have found it impossible to go more deeply into the subject, but hope that I may, at least, have made suggestions upon which a discussion may be profitable.

Builders' Notes.

The Edinburgh and Leith Master Builders' Association held its annual meeting last week, when Mr. Robert Lamb, Logie Green, was appointed president for the ensuing year in place of Mr. James Miller, who retires.

Mr. William Thomas Flavell, of Horsemarket, Northampton, died last week at the age of forty-six years. He was by trade a plasterer, and was for many years a well-known and respected tradesman of Kingsthorpe. Besides the plastering work he took up building.

The Portsmouth Master Builders' Association held its annual meeting recently, Mr. A. E. Porter, T.C., presiding. Mr. W. J. Light was elected chairman for the ensuing year. Mr. W. H. Evans was elected vice-chairman, Mr. H. Jones, treasurer, and the following committee was appointed: Mr. C. Dye, T.C., Mr. A. E. Porter, T.C., Mr James Crockerell, Mr. J. W. Perkins, Mr. H. E. Wilkins and Mr. G. R. Chamberlain. Messrs. S. Lillington and E. Bradshaw were elected auditors, and Mr. F. W. Simpson was re-elected secretary.

Building Operations at Sunderland.—According to a report that has been prepared by the Building Committee of the Sunderland Corporation, 352 plans for buildings of all descriptions were submitted during the past year. Of these 314 were approved and 38 disapproved. The plans that were approved included 143 for new houses, and these represented 658 houses. Cottages of one storey continue to be by far the most common style of dwellings erected at Sunderland, for it appears that the 658 houses were divided as follows:—334 one storey, 158 one storey and a half, and 166 two or more storeys.

Building Materials in Peru.—The system of building in vogue in Peru will be considerably modified shortly for sanitary reasons, and in view of the frequent earthquakes. Cement is of primary importance—a remark which also applies to iron shells for two-storied houses with double walls of sidero-cement, ordinary bricks, or compressed sand. Under these conditions this market will require prompt supplies of cement, iron girders for uprights and top-beams, iron for use instead of binding joints, &c. The employment of these will necessitate the use of screw-bolts, hand drills, shears, sledge hammers, &c.

Municipal Housing in Sheffield.—Ten of the cottages in Hands Lane are ready for occupation, and five more will be ready shortly. The cost of cottages, including land, erection, street works, and incidental expenses, will be approximately as follows:—

	Estimate.	Approximate total cost.
	£ s. d.	£ s. d.
Land		714 12 0
Contract work	1,856 15 4	2,020 14 6
Increased (through contractors having declined to carry out tenders) to	2,020 14 6	
Building work, &c., done by Highway Department	2,760 0 0	2,751 5 7
Printing, clerk of works' wages, street works, &c.		306 18 2
		£5,793 10 3

The rental of the cottages is to be fixed at 6s. 6d. per week each.

Cement Trade Difficulties.—In July last an agreement was made under which the principal London cement merchants agreed, upon certain arranged terms, to take their whole requirements of cement from the Associated Portland Cement Manufacturers, Limited. After the agreement had been in operation about six months, the latter gave the merchants notice that they were advised that the agreement was not enforceable. The merchants took counsel's opinion, which laid down that the agreement was enforceable, but the merchants, after considering the difficulties in their way, and the "critical and disorganised state" of the cement trade in London, decided not to enforce their contention. Consequently they have agreed, under protest, to the agreement being cancelled. There is considerable feeling in the trade on the subject; and Mr G. E. Wragge, chairman of the Associated Cement Merchants of London, 47 Belvedere Road, S.E., complains that "this agreement, which was drafted entirely by the manufacturers, and which at any rate was distinctly the understanding upon which the merchants were to be supplied with their cement should now be repudiated by the manufacturers."

London County Council.—At last week's meeting of the Council Mr. Samuel George Burgess, secretary and manager to the Middle Class Dwellings Company, Rowton Houses, Limited, and Wharncliffe Dwellings Company, Limited, was appointed manager of the Housing Department at a salary of £800. Mr. John Hall Rider, the chief consulting and resident engineer for electric tramways and electric lighting under the Plymouth Corporation, was appointed electrical engineer to the Council at a salary of £1,000 a year. Mr. Goulding, M.P., drew attention to a decision of the Housing Committee to hand over to contractors the work of constructing some dwellings for the working classes, instead of giving the works manager the option of erection. He remarked that already contractors had saved the Council £14 000 on dwellings as compared with the amount which the Works Department required for the work. Mr. Alderman Dew said the reason why the contractors could do work cheaper was that they had more freedom. In one case a contractor had his joinery done in Plymouth by boy labour, and a lot of it was condemned. It was patched up, however, and used. The maintenance cost of such work would be very heavy in the future.

Bricks and Mortar.

APHORISM FOR THE WEEK.

There is this difference between the products of the artist and of the craftsman: the artist produces what he himself finds good, the craftsman what is profitable. Phidias, for instance, finished his work with the greatest care, even though he did not sell it.—SENECA.

Our Plates. THE house by Mr. C. F. A. Voysey at Fernhurst, Sussex, is for a Mrs. Chester, and is now being built by Mr. F. Müntzer, of 16 Dover Street, Piccadilly, and Godalming. It is to be brick, cement rough-cast, with local stone terrace walls and steps, and local red-tile roofs. The hall and staircase will be entirely lined with oak, and the floor will be paved with slabs of Portland. Electric light will be provided by the engine that pumps the water. The windows will have Bath stone dressings and iron casements. The site is so steep that the bedroom floor is only 9in. above the upper terrace, the hall only 9in. above the entrance court, and the heating chamber and tool-room only 6in. above the lower terrace. The hall is open to the level of the ceiling of the bedrooms with an outlook from the landing and the parlour into it. The view from all the windows is most charming.

The Cloisters of Battle Abbey. THESE cloisters are among the most interesting parts now remaining of Battle Abbey. There is only one side left of the cloister garth, and the majority of the work is Perpendicular, of uninteresting character and much restored. The example published is, on the contrary, entirely untouched by the restorer, and is in almost perfect condition. It is executed in Caen stone, and dates about 1171, when Abbott Walter de Lucy rebuilt the cloisters. The small door shown is comparatively modern and gives entrance to part of the vaulted substructure of the dormitory known as "The Beggars' Hall." The window is, of course, also modern. All the mouldings are worked on the main wall of the building, being the inner side of the cloister aisle, and the springers of the stone vaulting are still in good condition. The carving of the caps and brackets is refined and quite Early English in feeling; unfortunately the concave stone of the circle has quite lost its enrichment, but the cuspings are good and well-preserved.

Winchelsea Church. WINCHELSEA Church is a fine "Decorated" building and was built between 1288-92, the choir, chancel and ruined transepts being all that now remain of what was once a very large church. The south aisle of the choir is the most interesting part of the church, and is called Alard's Charity, since it contains the elaborate canopied tombs of Gervase and Stephen Alard, and, in connection with them, the piscina and sedilia which we illustrate. These are in close proximity to the tombs and formed part of the same design. The carving has unfortunately lost much of its original sharpness, and the canopies have all had the tops (with one exception) broken off. These were not finished with finials as is most usual, but the sharp edge was left just running up. The Church contains altogether five monuments, two sedilia and piscinæ, and an aumbry; it has also a very beautiful choir arcade of lofty arches, supported on banded shafts of Caen stone and Sussex marble, besides some excellent windows. Our illustrations of the piscina and sedilia in this church, and also of the cloisters at Battle Abbey, are by Mr. Herbert Hall.

Ancient Ruins of Rhodesia. THE ancient ruins of Rhodesia form the subject of an article in the Christmas number of the "Buluwayo Chronicle." At the outset the authors refer to the romance of that deeply interesting land, and then go on to discuss the hundreds of ancient temple-forts scattered throughout its borders. All these temple-forts or Zimbabwes are in ruins. The altars are broken down, the orientated shrines once sacred to the votive worship of sun, moon and planets and the forces of Nature have become desecrated, and "the snake and owl inhabit there," while the very images of the gods have gone. No more the priestesses of Venus ascend to the summit of the sacred cones in these Rhodesian temples, which are all "open to the light of heaven," there 'mid pious orgies to acclaim the rising of the Queen of the Early Morning. These Phallic worshippers have gone, like the people of the ancient Aztec kingdom, the people who built the round towers of Ireland, the pagan temples in Scotland, reared the "cloven stones," and set up the "sacred circles" in England, as at Stonehenge, and scattered thousands of their monoliths and temples all over the world. The ruins, however, remain. One of the greatest of the circles, solidly built of well-cut granite sets, is of 280ft. diameter, the greatest height being 35ft. and the greatest base thickness 16ft. Around this vast structure lies a perfect labyrinth of ruins of a remarkable character. Experts derive from the orientation of the remains a date of about 1100 B.C. The authors of the article in question discuss the race who erected these wonderful remains, and give facts which incline them to the belief that they were of Sabæo-Arabian origin, and that Rhodesia was no other than the ancient Ophir associated with the glories of Hiram and of Solomon.

Bristol Infirmary Competition: Result. THE Special Committee of the Bristol Board of Guardians have issued their report in regard to the competition for a new infirmary. Fourteen architects were invited last May to compete, and seven sets of designs were received. Mr. Keith D. Young was the assessor, nominated by the president of the R.I.B.A. His fee was one hundred and fifty guineas. Mr. Young's award is as follows:—1st premium, £200 (design E), Mr. H. Percy Adams, of 28 Woburn Place, Russell Square, London, W.C.; 2nd premium, £150 (design A), Messrs. Giles, Gough and Trollope, of 28 Craven Street, Charing Cross, London, W.C.; 3rd premium, £100 (design B), Mr. Arthur Marshall, of King Street, Nottingham. The approximate estimate of Mr. Adams for the whole of the building, which will contain 852 patients' beds, accommodation for the medical and nursing staff and general administrative work, is £123,383, but the assessor intimates that in his opinion the cost will more nearly approach the sum of £153,796, although the price at which he has made his estimate is considered by the committee to be in excess of what the work can be done for at Bristol.

Victorian Art. "IN the whole history of British art," says the "Globe," "there is scarcely any period which can compare in importance with that covered by the reign of Queen Victoria. It must always be famous as a time of extraordinary progress and unprecedented development. From the Victorian era will, indeed, date the commencement of many great movements, the fruits of which will be enjoyed by generations as yet unborn. We are witnessing now the first stages of more than one undertaking that will affect in years to come the artistic activity of the world, and we are beginning to realise what is the significance of the events in which we are taking part. . . . It is only necessary to examine the condition of any branch of our art in the early Victorian days to appreciate what has been the progress that must be recorded during the Queen's reign. In painting and sculpture we have risen from a state of laughable incapacity to honourable rivalry with the best that any other country can show; and in the decorative arts we have become almost the arbiters of taste for the rest of Europe. British fashions in design provide the standards against which other nations measure their productions, and our designers receive the flattery of imitation all over the world. Yet we are far from having reached the limit to which we can hope to attain. Only the foundations of what is to come have been laid in Victorian art; but they have been laid soundly and securely, and the superstructure that will be raised upon them will be vast and monumental."

Architectural Registration in America. A CONVENTION of practising architects was recently held at the rooms of the Architectural League in New York, and the draft of a Bill to require persons practising as professional architects to pass an examination and be registered was discussed. A protest was read from the New York Chapter of the American Institute of Architects, and the Bill was finally referred to a committee of one hundred for further revision and presentation to the Legislature. The Bill provides that within sixty days after its passage the Governor shall appoint nine persons to constitute the New York State Board of Architects; the members of the board to serve without remuneration for their services, but to be reimbursed for their legitimate travelling and other expenses. The State Board may adopt, with the approval of the Governor, rules and regulations for the examination and registration of applicants for registration to practise architecture, the fee for which shall be at least $20 (£4 2s.). If the examination of any applicant is satisfactory to a majority of the board a certificate will be issued to him on the payment of an additional fee of $13 (£2 14s.), entitling him to practise. A person who, at the time of the passing of this Act, is engaged in practice shall be entitled to registration without fee or examination on the presentation of a satisfactory affidavit to that effect.

Forum Discoveries: Arch of Tiberius. ANOTHER important discovery has been made in the Roman Forum. In front of the Temple of Saturn, between the Rostra and the Basilica Giulia, Signor Boni has found a large platform of concrete with marks of a massive construction which formerly stood upon it. These marks have been recognised as those of the arch of Tiberius, which was of the same dimensions as the arch of Septimus Severus, and which stood in a line with the arch of Augustus. The position of the foundations corresponds exactly to the position assigned to the arch of Tiberius in the bas-relief on the arch of Constantine. Traces of these foundations were first discovered last November, but could not be with certainty identified until now. The arch of Tiberius was erected in the year 16 of the present era in order to celebrate the recuperation by Germanicus of the eagles lost by Varus when the three Roman Legions were destroyed by the Germans under Arminius.

Mediæval Castles of Wales. PROFESSOR LITTLE gave a lecture last week at Cardiff University College on the castles of Wales of the eleventh and fourteenth centuries. To illustrate his remarks, the lecturer dealt in detail with Cardiff and Caerphilly castles, showing what part each took in connection with the system of defence and government of the country. Until the end of the eleventh century, he said, there were comparatively few stone castles in the whole of Europe. Probably the first Cardiff Castle was a wooden structure erected upon an artificial mound, surrounded by palisades and a moat. This was within the mounds that had once protected the Roman camp. The probable site was the place on which the old "keep" now stood. The present "keep" was erected about the twelfth century, and it was probably in this "keep" that Robert of Normandy was confined, and not in the Black Tower as pointed out to visitors, which could hardly have been built at the time. He afterwards referred to the construction of the remainder of the castle, and to the raid of Ivor Bach, which resulted in a further modification of the defences. The dwelling-houses in the castle at that time probably occupied the site of the present buildings abutting on the west wall. After some reference to the customs and government of the period, he entered upon a lengthy description of Caerphilly Castle, which, he said, was one of the best examples of the concentric system of defence. The castle was built upon a mound of gravel, partly natural and partly artificial, which by artificial means was surrounded by water so as to form an island in a kind of lake. The eastern side was one of the most imposing pieces of military architecture known.

ASYLUMS AND ASYLUM PLANNING.

A MEETING of the Royal Institute of British Architects was held at the rooms in Conduit Street on Monday evening last, when Mr. E. A. Gruning, vice-president, occupied the chair. After an address by the president to the members in relation to the death of the Queen, and one presented by the Council to His Majesty the King on behalf of the Institute, had been read by the secretary, it was announced that in the ordinary course of events on the evening in question the name of the Royal Gold Medallist would have been announced; but this medal was a personal gift of the late Queen, and it was at this time not deemed expedient to approach the King on the subject. The Council intend, however, to make application shortly to His Majesty in reference to the matter.

The following gentlemen were then elected:—As Fellows: Messrs. F. S. Baker (Toronto), A. C. Blomfield (London), C. J. Blomfield (London), G. F. Collinson (London), W. Flockhart (London), John Leeming (London) and Joseph Leeming (London). As Associates: T. B. Ball (Weston-super-Mare), E. W. Banfield (London), G. Brumell (Morpeth), H. M. Cautley (Ipswich), W. G. St. John Cogswell (London), W. E. B. F. Crook (London), H. A. Douglass (Crowborough Cross), T. W. Gordon (Nottingham), A. H. Goslett (Great Stanmore), Shirley Harrison (Leicester), C. E. Hutchinson (London), A. L. MacGibbon (Edinburgh), R. H. J. Mayhew (London), W. V. Morgan (Carmarthen), R. W. Owen (Liverpool), A. W. Papworth (London), J. Quail (Manchester), F. J. O. Smith (London), E. J. Trench (Cambridge), C. B. Thomas (London), H. A. Tinker (London), P. J. Turner (London) and W. J. Walford (London). As Hon. Fellow: Sir Lawrence Alma-Tadema, R.A., F.S.A.

A paper on "Asylums and Asylum Planning," by Mr. George T. Hine, F.R.I.B.A., was then read by Dr. Hayes Newington.

Mr. Hine said that asylum construction embraced the study of almost every description of building, from a church to a cow-shed, and the art of combining so many dissimilar structures into one harmonious whole, with the engineering skill necessary to provide for and supply heat, light and water to what is practically a little town, made asylum architecture an almost distinct profession in itself. After giving an historical sketch of the progress and development in the building of public asylums, referring to many epoch-marking buildings, the author described some of the most notable erections since the Act of 1845 (which made it compulsory on local authorities to provide asylums for the insane in boroughs and counties in England and Wales), indicating the various stages in the evolution of asylum planning, a study of which is essential to a proper appreciation of its latest developments. Existing types of plan are all more or less developments of the corridor and pavilion systems. In the early days the corridor system, consisting of a long gallery, with single rooms opening out of it, was the only recognised principle on which an asylum could be built. The form was usually quadrilateral. After the Act of 1845, while the internal arrangements savoured less of restraint, the principle of the corridor system still prevailed. The first development was an attempt at classification by the introduction of a ward for the sick and infirm on each side of the building; the number of cells was reduced and more patients were allowed to sleep in associated dormitories. In the seventies special provision began to be made for epileptics, and the Lunacy Commissioners in 1874 published a plan designed by Mr. Howell for an epileptic ward, which has been adopted with trifling variations in nearly every asylum designed within the last twenty years. In the decade 1871-80 the most notable departure in planning is met with in the Lancashire County Asylum, at Whittingham, designed in what Burdett describes as the corridor-pavilion style, and characterised as one of the finest specimens of asylum architecture in England. The Gloucestershire second county asylum, erected on the pavilion system, the blocks being arranged in échelon, was the first of this type erected in England, and may be said to have originated the oblique or broad-arrow form of corridor now so commonly adopted in asylum designs. The Surrey second county asylum at Cane Hill, one of Mr. Howell's chief works, and accommodating 2,000 patients, is on the pavilion type, the blocks radiating from a main corridor of horse-shoe form. Criticising the variation of floor levels in this building, which necessitated flights of steps in the corridor, the author was of opinion that this irregularity could have been avoided by a more careful consideration of the surface levels of the ground and a little more excavating. He urged architects designing asylums to give a first consideration to the site. In many of the plans coming under his official notice the buildings were generally left to adapt themselves to the site rather than the site being adapted to the buildings. Describing the Claybury Asylum, designed by himself, the problem to be solved was how to accommodate 2,000 patients within reasonable distance of the administrative centre without prejudice to the position and aspect of their wards. The plan he adopted was a modification of the échelon type, the wards being approached from obtusely oblique corridors, the pavilion system being almost a necessity from the conditions issued. The asylum is built on the top of a hill, falling all ways, and by removing the apex of the mound, representing nearly 100,000 yds. of soil (which was well disposed of in filling up a valley to the north of the asylum), a level plateau was obtained, sufficient to allow of about half the patients' blocks and the whole of the administrative department being erected at one uniform level, the remaining wards being slightly lower, but in no case more than 5ft. below the central buildings. At Bexley Asylum the author first introduced the villa system on a tentative scale of three villas holding 35 patients each, and a detached hospital for 50 phthisical cases or others requiring isolated treatment. In this asylum, which accommodates 2,000 patients, all the wards communicate with one another, and an officer may pass from one end of the male or female side to the other without retracing his footsteps or being obliged in return to the main corridor. Bexley has proved so satisfactory that the London Asylums Committee have arranged with Mr. Hine to use the same plans, with a few modifications and improvements, for a second edition of this asylum at Horton.

Numerous other asylums were referred to, the author indicating their distinctive features and in many cases exhibiting plans.

The London Asylums Committee have found it necessary to add temporary buildings to some of their asylums. These erections, chiefly of wood and iron, provide accommodation for 1,700 patients at a total cost of about £173,000, averaging £100 a bed—a costly expedient, considering the limited life of these structures.

In 1889 the London County Council appointed a committee to enquire into and report upon the advantages of the establishment, as a complement to the existing asylum system, of a hospital with a visiting medical staff for the study and curative treatment of insanity. Their report showed the evidence to be greatly in favour of the scheme, and they summed up strongly recommending the establishment of such a hospital. The County Council nevertheless ignored the recommendation, and have continued building asylums on the old lines. Other county authorities, however, have taken up the matter, and are providing hospitals for the reception and treatment of curable cases. The provision of acute hospitals the author considered to be one of the most important evolutions in modern asylum planning.

Dealing with asylums on the Continent, various plans were shown of German asylums, and interesting details given of the villa system as seen in the asylum at Alt Scherbitz, which may be said to have originated this type of planning, now adopted more or less in modern American asylums, and more recently, but to a less extent, in England. The villas are constructed very much like boarding-schools, with day and class-rooms on the ground floor and associated dormitories above. The doors and windows are open, and the patients come and go as they please, wander about or work in the grounds, enjoying comparative freedom, but always under the watchful eye of carefully-trained attendants. No wall encloses the estate, only a light and easily climbable fence. The gardens surrounding the houses in the central establishment are enclosed with palings, grown over with plants and creepers. The colony is bounded on the south by the river Elster, which flows at the foot of a steep hill in the grounds, and there is nothing to prevent a patient rushing down the hill and plunging into the river. Great value is attached to residence in the colony, and patients are given to understand that their stay there depends on their good behaviour, and are thus encouraged to exercise self-control.

Having given an account of asylums as they are, the author went on to deal with future possibilities of asylum designing, and then gave a detailed description of an asylum as it should be, instancing a building to accommodate, say, 800 patients, with provision for future extension to 1,200. As an illustration, the plans were referred to of the new East Sussex Asylum now being erected at Hellingly.

To understand the first principles of asylum construction, it is necessary to know something of the eccentricities of insanity and the habits and treatment of the insane. The author recommended the student in asylum planning to make friends at all opportunities with the medical experts, and to study the subject in the light of those whose duty it is to look after the insane.

In the ideal asylum the most important building must be the acute hospital. Here it is that every patient, unless hopelessly incurable, is admitted, and during his stay in this hospital his future life is probably determined, whether he shall recover and go back into the world, or whether he shall pass on to the main asylum for the remainder of his days, to eke out an unhappy existence at a cost of more than £30 a year to his country. On every ground we cannot afford to neglect anything—consideration, care, or money necessary to produce a building—which affords the doctors the best opportunities for treating and curing their patients. Any money thus spent will prove the truest economy in the end.

The various parts of his ideal asylum having been discussed in detail, together with the engineering works, internal fittings, laundry, systems of heating and ventilation, &c., the author concluded his paper by a reference to the cost. He was of opinion that a well-built asylum, designed on liberal principles and fitted with all modern appliances, cannot be erected for much less than £300 a bed. Twenty-five years ago Nottingham Borough Asylum cost £170 a bed. But that the increased cost is not out of proportion to that of other building works is shown by the report of the Metropolitan Commissioners, where the cost of fifteen asylums erected before the year 1845 is stated to have averaged £200 a bed, some even then approaching as much as £300 a bed.

A discussion followed. Dr. Murray Cook (one of the members of the Lunacy Board), speaking of the cottage type of asylum in Germany, said that in that country a great proportion of the cases were very mild, so mild that here they would be dealt with in workhouses. He favoured having in all asylums a separate detached hospital for the special treatment of all recent cases which presented a prospect of cure. In his opinion more attention needed to be given to single rooms, which were often too small. As to the heating, he preferred steam coils; flues were often the source of much trouble and should be abolished whenever practicable. Another matter requiring special attention was the airing court: it was often much too small and unpleasantly situated. Dr. Urquhart said the latest model in asylum planning was the East Sussex Asylum; in America the latest was the St. Lawrence State Asylum. Mr. Clifford Smith and Mr. Gordon Smith also spoke. Mr. Hine replied and the meeting then terminated.

Law Cases.

Electric Light Signs.—In the High Court of Justice on Saturday last (before Justices Bruce and Phillimore) judgment was given in the case of *Hull* v. *The London County Council.* It was an appeal by Mr. Hull, a shopkeeper carrying on business in the Seven Sisters Road, London, from a conviction for exhibiting over his shop an electric advertising sign. The conviction was for a breach of the London Buildings Act, which provides that no obstruction, lamp, bracket, or projection from a building beyond the general building line, &c., should be permitted without the consent of the London County Council. For the appellant it was contended that the sign in question was erected in a window over the shop, and was no projection within the meaning of the section, and, therefore, the conviction was bad. Mr. Justice Bruce, in delivering judgment, said it was contended by counsel for the respondent that the section was wide enough to extend to anything attachable to a building. Their lordships did not think the words were so wide as to do that, as it was clear the intention of the statute was to preserve the width of the street in order to maintain architectural uniformity. They felt strengthened in the conclusion at which they had arrived because no inconvenience was likely to arise. The London County Council had power to make by-laws for the regulation of lamps, signs, projections, and such like, and a penalty might be imposed for any breach of the by-laws. The action taken by the respondents was barred by lapse of time; and after giving the whole matter the best consideration they could they came to the conclusion that the conviction must be removed, and that the appellant was entitled to the costs of the appeal. Judgment accordingly for the appellant, with costs.

Sale of Building Plots: Jury's Verdict Reversed.—The case of *Keats* v. *Rendle* was heard last week before Mr. Justice Day at the Devon Assizes. This was an action brought by James Henry Keats, architect, of Plymouth, against Mr. E. M. Russel Rendle and Mr. C. B. Rendle for commission earned, and also claiming damages for wrongful dismissal, the total claim being £1,600. Defendants denied entirely the owing of any commission or that plaintiff had been wrongfully dismissed. Lord Coleridge (for the plaintiff) said that defendants and others had been the owners, or trustees, since 1876 of the Vinstone estate at Compton, Plymouth, and were desirous of having it laid out as building plots. Plaintiff was consulted, and after several interviews it was substantially arranged that he should act as architect to the estate, that he should be empowered to sell building plots at a price to be agreed upon, and that in addition to 5 per cent commission he should receive £4 4s. from the purchaser of each plot. Upon this arrangement general conditions were embodied, and Mr. Keats took over the duties of architect. Messrs. Woolcombe and Pridham, who were at that time solicitors to the trustees, wished the commission to be limited to lands comprised within the meaning of building land, but plaintiff replied that in connection with all land he must have a commission of 5 per cent., even though the land might not necessarily be sold for building purposes. If he found a purchaser for land, although it might not be built upon, he expected his usual commission. For a considerable time matters went on satisfactorily, but in 1896 a dispute arose in regard to certain land to be let to a Mr. W. Law. Plaintiff had had some correspondence with this gentleman, but in October, 1896, he was informed by Messrs. Rooker, Matthews & Co. (acting for defendants) that it was possible the owners might receive an offer for a considerable portion of the property in block, in which case they would not require the further advice of an architect; therefore, plaintiff was to kindly let them know his charges against them, as the co-owners were anxious to clear off the liabilities on the estate. At this time plaintiff had been working eleven years on the estate, having supervised the draining and other necessary work for its development. In consideration for all time and labour he naturally expected ultimate commission on the plots. He declined to agree to their arrangement, and stated that he should claim from the vendors 5 per cent. commission on the purchase-money of any land sold included in his building plans, together with the contract fees which the general conditions provided for. Plaintiff contended that he was engaged by the defendants to be their architect and adviser until the whole of the building plots were sold, but as soon as the defendants believed they had a purchaser for the whole of the land they desired to get rid of his services and dispute an arrangement previously made so as to evade the payment of commission. Mr. Duke (for the defendants) said that Lord Coleridge had put the case before the jury as if it had been a very hard one for plaintiff, and that he had been served badly by the vendors. The whole thing was ridiculous. What land plaintiff had sold he had been well paid for, and according to a settled price. Had the jury ever heard of a man being employed to sell land on commission for life, and that he and no other could be employed for the purpose? He protested against the suggestion that the vendors desired to deprive plaintiff of commission. The learned judge, in addressing the jury, said: This is a most extraordinary action. My career at the bar, both as counsel and judge, has been a long one, but I must at once say that I have never heard of any action like this before. I have never heard of an action brought by a person against another for commission and services unless there has been an agreement in writing, or of some form. Here you have nothing whatever in the form of an agreement, but merely something entered in an every-day diary of a conversation, or something of that kind. Plaintiff tells you that he was to receive 5 per cent. commission on building sites on this estate, no matter if the last is not sold until years to come; in fact, that his appointment is a life-long one, no matter how many years he has to live. Can you believe that plaintiff had the right to dispose of plots whenever he liked and to get his commission? There is no such specific evidence that such is the custom of architects. After a quarter of an hour's deliberation the jury found a verdict for plaintiff for £200. Mr. Duke: I ask for judgment to be entered for defendant. His Lordship: And I grant it. The learned judge therefore set aside the verdict of the jury.

Surveying and Sanitary Notes.

A Welsh Sewerage Scheme.—The sewerage scheme for Senghenydd, Abertridwr, and Caerphilly has now been constructed by Mr. T. Rossiter, builder, Caerphilly, at a cost of £13,000. The main extends from Senghenydd to Wainybarra Farm, a distance of about six miles.

Institute of Sanitary Engineers.—At a meeting of the election committee held on the 13th inst. the following were elected:—Members: H. J. S. Abrams, London; W. N. Cosgrave, Straits Settlements; T. A. Groghan, Buxton; J. E. Scott, Newcastle-on-Tyne. Associates: G. W. Bird, Ripley; A. E. W. Blissett, Clifton; W. T. Mansfield, London; and J. J. Pratt, Hillingdon.

Mr. William Williams, surveyor for the county of Brecon, died last week, at the age of 78 years. Mr. Williams held the county surveyorship for thirty-six years, having succeeded his father, the late Mr. William Williams, of the firm of Messrs. Williams and Sons, builders and contractors, in the appointment. He was also one of the diocesan surveyors for the diocese of St. David's, and for a number of years filled the position of agent of the Penpont Estate.

"The State of London Streets," was the subject of a paper read by Mr. Thomas Blashill, F.R.I.B.A., at the Sanitary Institute, Margaret Street, W., last week. Mr. Blashill said that if he asked them to agree with him that their streets were dirty and ought to be cleansed, it was because he could see the dirt and knew that the means of cleansing were well within their reach. He would not say, as some had said, that London streets were the dirtiest of any to be found in the cities of Europe, but amongst the great Continental towns that he had seen, whether capitals or not, there was nothing similar to them. In all such towns the streets, however they might be paved, were kept clean. Thirty years ago the condition of the roadways in London, both as to paving and cleansing, was a matter of serious consideration. He had taken some interest in the matter, and sketched the design from which was made the "street orderly bin" that was now used on nearly all their asphalt roadways and might be seen in the chief Continental cities. In Glasgow they had hundreds of receptacles sunk in the pavement. Sometimes trucks or barrows were used, as in Holland, where the town streets were admirably kept. He was convinced that for town thoroughfares that was the only satisfactory principle. The work of a scavenger should no longer be considered of a low class, or even "unskilled"; it should be well paid and made to attract respectable, able-bodied men. The horse-broom, where needed, should be used with discretion, and kept in good order. He offered suggestions as to the material for roadways, and said that "Macadam" was never carried out as the inventor intended. A scheme which seemed feasible was carried out at Hamilton, in Ontario, where, after long experiment, a macadam of limestone saturated with boiling tar had been adopted. He thought that if granite stones which would pass through an inch and a half ring were mixed dry with boiling pitch, as was done with large gravel, and laid on a firm bed, then sprinkled with fine chippings and lightly rolled, a good hard roadway would be obtained. He had a strong and unhesitating opinion that the dirt in our streets, apart from odious comparisons, had increased, was increasing, and ought to be diminished.

Quarry Notes.

A Large Block of Compact Grey Granite has been quarried recently by one blast at the De Lank granite quarries, Bodmin. The block was of the finest grey granite, measuring 68ft. long by 20ft. wide, by 14ft. deep, and weighed about 1,400 tons. It is to be used principally in the construction of the Beachy Head lighthouse. This is believed to be the largest and finest block of grey granite ever produced in the United Kingdom. It was from this quarry that the granite for the Eddystone Lighthouse and the Tower Bridge, London, was obtained.

Tunnelling Through Solid Granite.—A tunnel through two and a half miles of solid granite has been successfully accomplished in the United States, where it has been necessary to cut through the Cascade range of mountains. This work is considered one of the most notable engineering feats of the century. Boring was started at each end towards the centre, and so accurate were the engineers' calculations that at the meeting point the difference of alignment was scarcely 1in. This cutting through refractory material was accomplished in 45 months by 800 men, operating 32 compressed air drills.

Solid Stone has been made to flow under pressure in some experiments made by Messrs. F. D. Adams and J. T. Nicholson upon pure Carrara marble. Polished columns 1in. in diameter and $1\frac{1}{2}$in. in length were placed in a wrought-iron tube, the ends of which were left free, and pressures up to 13,000 atmospheres were exerted by means of accurately fitting steel plugs. Under these conditions the marble was permanently deformed, its flow being like that of metals, and in some respects like that of glaciers. The colour was changed to dead white, the strength being weakened more or less according to the time required for the change. At ordinary temperatures the deformation was due in part to granulation, and in part to twining and gliding of the single crystals comprising the rock; but at elevated temperatures only the twining and gliding took place.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stresses in Arched Lattice Girder.

KENSINGTON.—C. H. G. B. writes: "Kindly give a simple formula for working out the strains on an arched lattice girder, as I am thinking of using one as a roof principal."

There is no simple formula for calculating the stresses in such a roof truss as this. It is one of the indeterminate cases, and assumptions have to be made that may or may not be justified by the construction. It is usual to consider that the radial bars, like the vertical members of a lattice girder, transmit half the load that reaches one end through the bar to the other end. The accompanying diagrams show an attempt to work out the case by a reciprocal diagram, but owing to the smallness of the scale the closing points 15–16, which ought to be in the same horizontal line, are separated by a considerable interval.

HENRY ADAMS.

A Building-line Question.

FOLKESTONE.—QUERIST writes: "Supposing a person purchases a plot of land for building purposes, and on the agreement it states that the building line must be 30ft. from the boundary of the property. Is not the 'building line' legally considered to be the main wall of the house and not the bay-window projection, as shown on sketch (not reproduced). The former owner of the land states that the building line is that of the bays, which project 2ft. 6in., and he says he can make the present owners pull them down?"

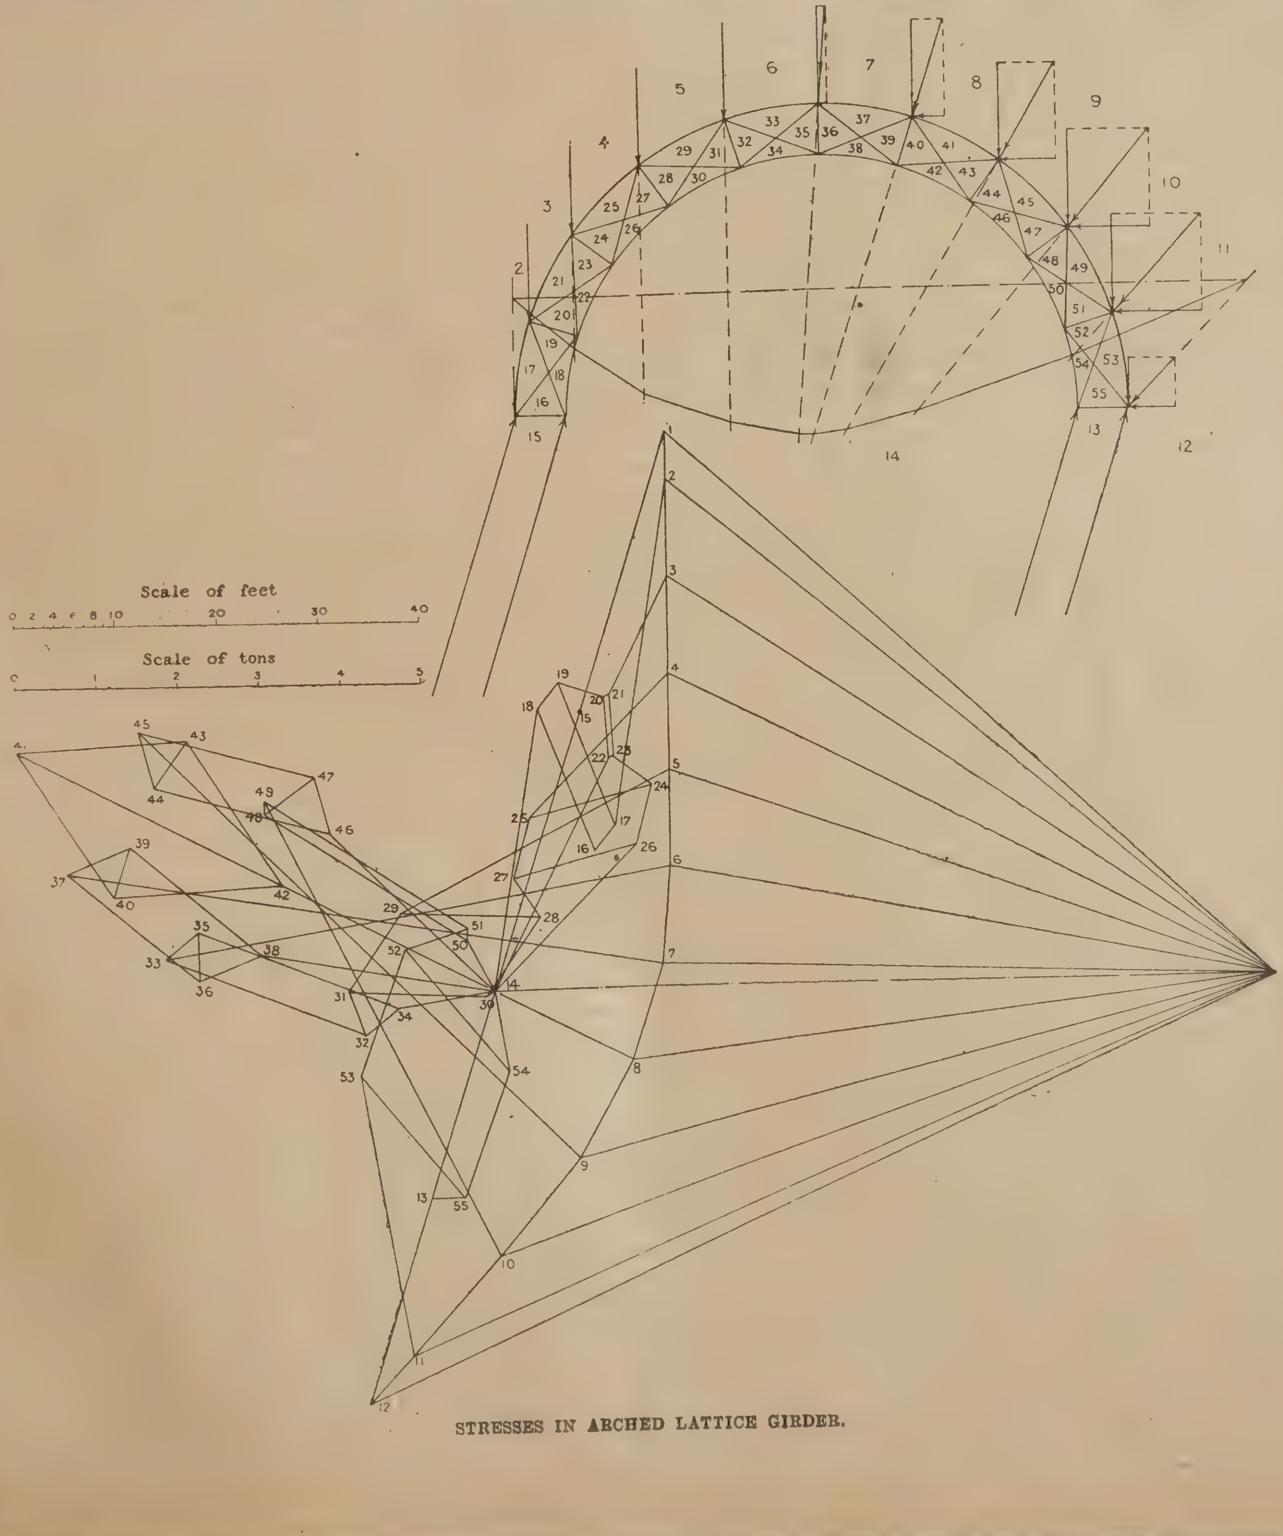
Undoubtedly the generally accepted definition of "building line" is that laid down in the "Model By-laws." "Width, applied to a new street, means the whole extent of space intended to be used . . . as a public way, exclusive of any steps or projections therein, and measured at right angles to the course . . . of such street." We do not know how far this affects your case, as your agreement is evidently a private one. Nor do we know how long your premises have been built; for if your houses were erected and the bays completed for a considerable period of time before the former owner raised his objection, we think it would be held in a court of law that by not giving you notice of objection at an earlier date the former owner gave his tacit consent to your interpretation of the term "building line."

R. W. C.

Building Construction.

BRIXTON, S.W.—DERRICK writes: "Would it be beneficial to a person who has not much knowledge of mathematics, but who has a good knowledge of the construction of buildings in general, to undergo a course of instruction in stresses and strains in structures? Also, would it be advisable, without having any knowledge of trigonometry or advanced mensuration, to take up a course in land surveying? I wish to acquire sufficient knowledge to enable me to deal with the small surveys generally needed in the routine of an architect's office, and for the intermediate examination of the R I B.A."

We think it would benefit you in the highest degree to undergo the course of training in stresses, etc., which you suggest. Presumably you have the ordinary school knowledge of mathematics and the subject should give you no trouble, though we should advise personal



STRESSES IN ARCHED LATTICE GIRDER.

tuition, as in that case every difficulty that arises is more quickly explained. A practical knowledge of land surveying may be acquired without the assistance of trigonometry. Here again we should recommend personal tuition in out-door classes. R. W. C.

Making Wood Floors Sound-Proof.

MARGATE.—C. F. H. writes: "Kindly describe an economical method of making a wood floor sound-proof."

The article on this page will supply our correspondent with the information he needs.

Whitening a Ceiling.

MALTON.—R. N. F. writes: "I should be glad to know how to whiten the ceiling of a farmhouse kitchen. All local men have failed. The fire has for some time smoked badly, and it may be that inferior oil lamps have been used which have also blackened the ceiling. Cleaning, sizing and whitening is no use as the ceiling is yellow at once, the colour striking through. Now that the causes of the discolouration are removed I should like to remove the effects."

Obviously smoke is the cause of the discolouration. Various methods have been used to remove or hide the effects of smoke, such as coating the ceiling with newly-slaked lime, applied while hot; after allowing the limewash to remain for three or four days to enable the lime to kill the smoke effects the ceiling is washed, and when dry whitewashed in the usual way. A solution of chloride of lime applied and the ceiling treated in the same way as above has also been used with more or less success. Another method generally successful but more costly than the above methods is effected by thoroughly washing the ceiling, and after it is dry painting with a good oil paint; when the ceiling becomes dirty in time through use it can be whitewashed in the usual way. Ripolin is a good paint for this and many other purposes, as it is easily applied, resists discolouration, and can be readily washed when soiled. An effectual and permanent remedy can be obtained by covering the ceiling with plain-face fibrous plaster slabs or with "Ornato" slabs. These slabs are easily fixed over the existing ceiling, thus covering all its defects and strengthening the old plasterwork. The slabs being dry when fixed and having a finished surface can be painted or whitewashed as soon as fixed. W. MILLAR.

Imitation Stone.

LONDON, N.W.—J. H. W. writes: "I wish to make some imitation stone. Can you tell me the best materials to use with the Portland cement when gauging. I particularly want a yellow and light-coloured stone."

Artificial stone is made with a combination of Portland cement and a suitable aggregate, such as granite chippings, crushed slag, broken stone, bricks or pottery, gravel, breeze, or sand. The proportions of the aggregate vary from three to seven parts to one of cement, according to the purpose for which the stone is required. A yellow colour can be obtained by the admixture of a yellow oxide, and a light colour by the admixture of powdered chalk to the cement. A durable yellow colour is also obtained by the use of yellow sand, and a durable white colour can be obtained by the use of silver sand. These sands are used in combination with the cement used for the "slip," *i.e.* the first gauge used for covering or facing the moulds when casting artificial stone. Good yellow sand, also silver sand, fine but sharp and well adapted for these purposes, can be obtained from J. Arnold, 32 St. Paul's Road, Camden Town, N. W. MILLAR.

A new School at Preston.—The T. C. Hincksman Memorial School, Croft Street, was opened recently. The plans for the new premises were prepared by Mr. Robt. Curwen, of London, and the tender of Mr. George Lucas, for £3,850, was accepted for the work.

Masters and Men.

The International Union of Building Labourers held its annual convention last week at Paterson, New Jersey. It was decided, on the suggestion of representatives from England, to amalgamate with the National body in England.

Blackpool Joiners' Strike.—As an outcome of this strike, the members of the Blackpool and St. Anne's branch of the Amalgamated Society of Carpenters and Joiners are taking definite action with a view to the establishment of a united joiners' works in the town. During the protracted struggle the men have executed several jobs on their own account.

The Teesside and Hartlepool Joiners have sent a demand to the Master Builders' Association for an advance of wages to date from May 13th next of one penny, or from ninepence to tenpence per hour. Alterations of rules with regard to permitting men unable to commence work at half-past six to start at seven, and seeking an allowance for lodgings when working outside of the town are also included in the demand.

The Northern Bricklayers on strike have agreed with the master builders for arrangements to be made for the Board of Trade to appoint an official to act as umpire at the forthcoming arbitration proceedings. Each party has their own representatives to lay their claims before the umpire, and he will give his decision shortly as to whether the bricklayers are entitled to an advance of one penny per hour. At the termination of the arbitration court the men will resume work.

The Dundee Masons' Dispute has been settled. Some time ago the Employers' Association issued a notice to the men that wages would be reduced by a penny per hour on February 16th. The men opposed the proposed reduction and threatened to strike. It has now been agreed, however, that wages should be reduced by one halfpenny per hour taking effect on 16th instant, and no further change made in the wages till May, when the matter will be further considered.

The Glasgow Joiners' Lock-out.—After a five weeks' dispute the Master Wrights' Association of Glasgow have given in to the operative joiners. The struggle arose over a proposal by the masters to reduce wages from 10d. to 9d. per hour. The men insisted on the maintenance of the bargain which bound the masters to pay 10d. per hour until the end of April, when a new agreement would fall to be arranged. A notice tantamount to a lock-out was then posted by the masters. The men at once came out, but, as many of the large employers failed to fall into line, there never were more than 800 of the men idle at any time during the fight.

Cardiff Plasterers.—A deputation from the Cardiff Branch of Operative Plasterers waited last week on the Cardiff Public Works Committee to protest against the employment of labourers as plasterers on the new corporation tramways now being laid. The spokesmen said that plastering tools were now placed in the hands of men who had never learned the trade, and it was a trespass on their occupation. If the work were done with shovels there would not be the same complaint. The deputation claimed that the "floating" in preparation for the laying of wood blocks was plasterers' work, but the matter was referred to the borough engineer to report on the practice of other towns.

The Fleetwood Parish Church Spire is stated to be in a dangerous condition. It has been examined by Mr. R. B. Preston, architect, of Manchester, who has sent in a report to the vicar and churchwardens, intimating that the spire must either be repaired or removed. The architect proposed to erect in its place a dwarf spiro with a flagstaff in the centre, surmounted by a weather-vane and cock as an emblem of St. Peter, also to renovate and improve the pinnacles of the tower.

PROTECTION OF HOUSES FROM DAMP, COLD, HEAT AND NOISE.

BY R. W. CARDEN, A.R.I.B.A.

Exclusion of Damp.—Damp-proof courses may be made of lead, asphalt, stoneware and slate, in addition to which there are many patent courses on the market. The usual slate course of two courses in cement is not to be recommended, as a settlement would crack the slates and render them useless as a protection against damp. Lead, in a heavy building, is liable to squeeze out at the sides, and does not form a firm bed for the course next above it: this means the possible chipping of stones or bricks in that course. Stoneware makes an excellent and impervious damp-course, but is not very suitable for use where a vertical course is also required, as this must be of different material. Asphalt is best for both vertical and horizontal work, as it can easily be plastered round at any curve or angle, making the whole system of proofing continuous. The writer's experience with patent bituminous courses has been that they are so unequal in thickness that the joint into which they are built has to be about 1in. wide in order to give the course next above a level bed. Dry areas have been so fully discussed in the technical works on building construction that there is no need to deal with them here. Moreover, an article on "Hollow Walls" was published in the issue of THE BUILDERS' JOURNAL for January 16th last, to which readers can refer.

Fig. 1 of the accompanying illustrations shows the ordinary precaution to be taken for cellars partially (or even wholly) underground. The damp-course in all these figures is of Val de Travers asphalt. For inhabited basements the same precaution might be adopted, though while the wall would be dry it would always feel cold to the touch. A better expedient would be to use a hollow wall, or, better still, a hollow wall protected externally by a vertical damp-course (see Fig. 2). Ventilation to the underside of the floor is obtained by means of air-bricks, the air passing down the 2in. cavity. As in many London houses, it is probable that the ground would be below the floor level at the other extremity of the building, so that the ventilating bricks could be placed as shown by dotted lines.

Fig. 3 is for use where the soil is very moist, where there may be considerable upward pressure against the underside of the concrete. This is a less troublesome method than forming an inverted arch in the concrete, as it saves curving the under-concrete to take the arch and also the difficulties of forming the arch in this position. The damp-course is built *in* the concrete just below the joists: this will effectually keep the damp away from them and prevent rust, the joists being coated with Dr. Angus-Smith's solution before the concrete is put in.

Exclusion of Sound, Heat and Cold.—The principle which underlies all work of this nature is the simple fact that air is a very bad conductor of sound, heat and cold. Therefore form an air layer in everything about the building. Boots that are a little too large are warmer in winter and cooler in summer than boots that fit exactly, because there is room for a layer of non-conducting air in the former, while the latter allows no such protective layer. Figs. 4 and 5 illustrate this principle as applied to floors, Fig. 6 as applied to doors, and Fig. 7 as applied to windows. Patent expanded metal lathing could be substituted for the asbestos slabs in the concrete floor, but the method shown is cheaper, as the slabs are fairly thick and quite capable of being secured to the ceiling joists without the addition of boarding. In Fig. 7 the outer window is an ordinary double-hung sash, while the inner one is a casement made to open inwards. It should be mentioned that there is also another system of double windows in which the panes only are doubled. It is a simple contrivance, but not very efficacious, as in view of the fact that the space has to be contrived in considerably less than half the thickness of an ordinary sash, the layer of protective air cannot be more than $\frac{3}{8}$in. thick.

THE PROTECTION OF HOUSES AGAINST DAMP, COLD, HEAT AND NOISE. BY R. W. CARDEN, A.R.I.B.A.

GOTHIC ART AND THE BASIS OF ITS BEAUTY.

A MEETING of the Architectural Association was held on Friday evening last at 9 Conduit Street, W., when the chair was occupied by Mr. W. H. Seth-Smith, the president. After it had been announced that a special general meeting would be held on Friday, March 8th, at 7.30 p.m., when the scheme for the establishment of day classes at the Architectural Association would be submitted to the members, and after Mr. M N. Castello (of London) had been elected a member, Mr. E. S. Prior read a paper on "Gothic Art and the Basis of its Beauty." He asked whether there was such a thing as beauty in art, and cited Tolstoi's deduction that such beauty was a phantom and an impossible endeavour. But whatever might be thought on this point, there certainly was a love of beauty.

He referred to some of the suppositions as to who were the creators of the Gothic art. These might be summed up into three theories—the ecclesiastical theory, the freemason theory, and the architect theory. The ecclesiastical theory would derive the origin of beauty in Gothic art from the faith and character of the religious orders and the members of the several religious houses. In defending this theory the supporters gave to words mentioned in old documents a meaning which was exaggerated or inaccurate, and ascribed to many holy men to whom churches were dedicated the actual design of the building. This could not be maintained. The clearest records from the seventh to the sixteenth centuries proved that the common practice was for the church authorities to hire builders and masons to do their work, and it was these latter who really were responsible for it. Certainly as regards the plan—the accommodation—the abbots and monks did dictate and direct the workers, but there the authority ended. It did not follow that the design of the building lay with him who ordered it. Moreover, the ground plan was very much a matter of tradition, and the construction which followed was done by the masons according to well known lines. It should, however, be mentioned that there was some supervision by clerics. The venerable Bede says that in the seventh century workmen were instructed in building by clerics, and without a doubt stone buildings came as the result of missionary effort. But this must not be carried so far as to affirm that there was a class of clerics who *designed*, and so produced the Gothic art. If records were searched and the correct meaning given to words it would be found that the freemason theory was similarly defective. Macaulay asserted that the English cathedrals were built by travelling masons, and the word "comacine" had been interpreted and extended in a like manner After the eighth century we lose trace of the comacine masons (so called from an island in the lake of Como, where they worked); yet in much later times buildings—even crosses so far away as in Ireland—were asserted to have been erected by them. Anybody in Lombardy was a comacine! Wyatt Papworth had thoroughly investigated this matter and sifted the evidence, and his opinion was that "all the documents lead me to believe that there was no masonic guild in England." It was like all the other guilds, to which the various workmen belonged. There was no brotherhood of masons other than the recognised craft of masonry. But there certainly were master-masons. Mr. Prior then dealt with the architect theory, referring in particular to Street's book on Gothic architecture in Spain, and his conclusion was that in the olden days there was no such person as an architect as we know him to-day—such a person originated in Elizabeth's reign. In fact, everything went to prove that Gothic art was cosmic, not individual; that though, as indicated, certain points of the building were dictated beforehand, the fabric grew up under the combined hands of the several workmen.

A discussion followed. Mr. G. B. Carvill could not conceive how a building like Lincoln Cathedral could be erected without some person in the position of an architect. Mr. G. H. Fellowes Prynne held a similar view. He felt that what Coleridge said was true—the architecture of our churches was the petrifaction of our religion—and it was the religious lives of the men of Gothic times that constituted the beauty in their buildings. Salisbury Cathedral was surely the result of one mind—it showed this too strongly to be otherwise. Mr. H. H. Statham said we should look more at the buildings themselves than at the documents referring to them, and he could not see how some buildings could have been erected other than under the direction of one mind. The remarkable similarity between Ely and Peterborough Cathedrals was cited. Even if there were no such name as architect in olden days, there was a man—perhaps a master-mason—who practically represented him. Mr. Hooper referred to the statement that bands of workmen travelled from town to town, and cited the fact of the same workmen having been employed over and over again by Sedding in the restoration of Cornish churches. Mr. Prior, in replying, said that Lincoln Cathedral, now isolated, was formerly surrounded by other buildings possessing the same characteristics; he then dealt at some length with the other questions raised. The meeting then terminated.

New Patents.

These patents are open to opposition until March 23rd.

1900.—Lifts—1,310, W. B. SAYERS, 189 St. Vincent Street, Glasgow. The cage is fitted at the top with wheels or rollers having resilient tyres (pneumatic or cushion). These wheels run in grooves formed in the vertical guides. The object of the invention is of course to enable the lift to work smoothly.

Measuring Rules.—4,722. R. WEBSTER, 42 Milner Square, Islington, London, and A. G. THORNTON, St. Mary's Street, Manchester. This invention relates to the combination of a wire and metal gauge with an ordinary folding rule. The gauge is arranged on the almost circular hinge, which is perforated at the edge for the purpose mentioned.

Secret-Nailing Wood Floors. — 4,812. T. POTTER, 5 Outram Road, Croydon. The floor boards are rebated or grooved for the purpose of hiding the nails, the rebate or groove being filled (after the board is fixed) by a slip of wood glued in place.

Ventilating Fans.—22,821. H. SIDEBOTTOM, Brazennose Street, Manchester. The fan consists of a flat disc of metal having vanes fixed on it around a central cone. Air is sucked in at the apex of the cone, drawn along its sides, and finally discharged by the vanes at the edge of the fan, the formation of a central vacuum being entirely prevented.

The following specifications were published on Saturday last, and are open to opposition until March 30th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—1,443, ADAMS AND WHITGREAVE, means for spraying liquids, disinfectants, &c. 1,450, HOLME (*Silfverberg*), push for electric bells. 1.776, NÖLTHER, roofing tiles. 2,888, 2,888B, 2 888C, 2.888D, 2.888E and 2,888F, NAEF, method and apparatus for producing gas and by-products. 3,126, LACHMAN, pulleys and wheels. 4,001, ORME, vehicle hoists. 4,389, APPERT, apparatus for rolling glass. 4,686, PERFETT, smoke-consuming stoves. 4,786, MORELLE, apparatus for generating acetylene gas. 4,924, BRADBURY, BRADBURY, BRADBURY AND BRADBURY, guards for circular saws. 6,015, JAMES, drawing pins. 6,131, VON GELDERN-EGMOND AND VON LIPOWSKA (*née* VON GELDERN-EGMOND), sheet-metal bearing plates for buildings. 7,210, VON WELSBACH, osmium illuminating filaments. 12.525, PETRÉANO AND LA COMPAGNIE GÉNÉRALE D'INCANDESCENCE PAR LE PETROLE ET L'ALCOOL, hydrocarbon burner constructed without the use of solder for lighting or heating purposes. 12,990, FRANKLIN, syphon-discharge cisterns for waste-water preventers. 16,345, RICHARDS, metal-cutting machine for planing and shaping. 17,700, JACKSON, kilns. 17,966, KELSEY, process of making glue. 18,211, CHANDLER AND CHANDLER, revolving gas scrubbers and washers. 19.214, BAKER AND DARBY, window blinds. 19,733, WONNACOTT, hinges and fittings for casement windows, &c. 29,045, LOGAN AND PORT, timber-sawing machines. 20,726, REGNARD, apparatus for mechanically washing sand. 21,948, MCKELVEY, concrete mixers. 22,189, JACKSON AND MCDONOUGH, combination wrench, screw-thread cutter and vice. 22,206, BOULT (*Grasset*), carburettors for air and gas. 22 227, VOGT, sinking or boring mechanism. 23 311, RENO, inclined elevators. 23,486, SCHUBIG AND STEIN, cisterns for water-closets.

Correspondence.

Load on Girders.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In Professor Adams' reply to "Student" on page 495 of your issue for January 30th he states that "the minimum load is that portion of the wall contained within an equilateral triangle, having the full length of the girder for a base." I understand the theory is, that the wall over would form a natural arch and throw the weight (over same) on to the piers, so that in the event of the girder being removed, only the shaded part shown in the sketch would fall. But the triangle should have the span for its base, as the span (not the length of girder) is the basis for calculating the load on girders. In the other example the principle of the arch does not apply. Would it not be advisable in this case to take the weight on the beam—span multiplied by the height of wall, openings deducted? Part of this load would be concentrated and part distributed. It is also stated "the allowance beyond weight of material for live load on floors is $1\frac{1}{4}$cwts. per sq. foot for living rooms." In a text-book this is given at $1\frac{1}{4}$cwts. per sq. foot, including weight of floor, for distributed load.—Yours truly, J. D.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the above letter, which you kindly forwarded me for perusal, your correspondent is quite correct as regards the natural arch theory, but he is wrong as to the clear span being the basis for calculating the load on the girder. For instance, in the pressure on bearing surfaces it is the load on the whole length of the girder that is acting without any doubt being possible. In the second case the natural arch principle is perhaps not quite so apparent; it might be called the natural corbel principle, and after all it is only an approximate means of arriving at that which does not admit of exact calculation Where there is no object in keeping the load as small as possible it is simpler to take the whole weight vertically over the girder as acting, and this would err on the side of safety. I find that in "Notes on Building Construction," Vol. IV., the second case is given with triangle of 45°, having its base from centre to centre of bearing surfaces. As regards load on floors, a dense crowd averages 120lbs. per sq. ft., and "Molesworth" says: "For flooring $1\frac{1}{2}$ to 2cwt. per square foot, exclusive of the weight of the flooring is generally allowed. In store-houses from 2cwt. to 4cwt. per square foot," so that the text-book which says $1\frac{1}{4}$cwt. per sq. ft., including weight of floor, is not reliable. It might, however, be a sufficient allowance for bedrooms.—Yours truly,

HENRY ADAMS.

Old Lancashire Churches.

To the Editor of THE BUILDERS' JOURNAL.

SOUTHPORT.

SIR,—"Anxious," of Southport (see page 33 of last week's issue) will find in the reference room in the Southport Free Library "Notes on the Churches of Lancashire," by the late Sir Stephen Glynne, edited by Canon Atkinson, of Bolton. The book is Vol. XXVII. of the Chesham Society's publications (1893).—Yours truly, F. H. CHEETHAM.

Professional Practice.

Halifax.—The new Victoria Concert Hall was opened recently. It is situated at the junction of Fountain Street with Commercial Street and Wards End. Mr. W. Clement Williams was entrusted with the work of preparing plans. He was asked to design a hall thoroughly suited for the particular purpose in view, and at the same time to enable the frontage to be used to the best advantage for increasing the revenue by shop rents. The structure, as now completed, comprises a large hall, eight lock-up shops, a restaurant in the basement, and a lecture theatre for smaller meetings. The large hall is 72ft. wide and 120ft. long. The auditorium has sitting accommodation for 836 people on the floor, and is provided with two galleries. The first is set apart as the grand circle, and will seat 500, whilst the upper tier, or balcony, will seat 750. Adding to these figures the orchestra accommodation of over 300, the total seating capacity of the hall is 2,422. It should be noted, however, that, acting upon instructions from the committee of management, the architect has allotted 21in. to each sitter, whereas the average space allowed in public halls throughout the country is from 16in. to 18in. The estimate of 2,500 is therefore a reasonable one. The stage measures 55ft. by 40ft., and is so constructed that it can be used as a platform for dramatic and operatic performances, but is also provided with a removable orchestra for choral-concerts. At the back of the stage will be permanently located an organ at a cost of several thousand pounds by Messrs. Hill and Son, of London. The instrument has been planned with a view to it forming little or no obstruction on the stage, and is divided into two portions, which fit into opposite angles, a screen connecting with the manual in the centre. It will only encroach upon the stage two yards. The area, or lower level, of the hall is fitted with a spring dancing floor that can be blocked and made into a solid floor in three minutes, and is capable of bearing some 800 or 900 persons with safety. This arrangement is a novelty, the invention of the architect. The ceiling and proscenium are of a very ornate character. Various panels are fitted in with figure paintings emblematical of the arts. The galleries are supported on the cantilever principle. The slope of the galleries as arranged, affords every person in the building a clear view of the stage. Under the orchestra are dressing rooms for the artistes. Separate cloak-rooms are provided on each level for both ladies and gentlemen. The large hall is approached by a vestibule 12ft., opening into a hall 35ft. long by 30ft. wide forming an irregular octagon. From the centre of this entrance hall rises the grand staircase 9ft. in width, branching out on the first landing into a double staircase by which the grand circle is reached. On either side of the staircase are entrances to the area each 11ft. wide The balcony is approached by a separate entrance from the higher ground at the junction of Powell Street with Fountain Street. To secure means of exit separate staircases have been constructed at the four corners of each level in addition to the entrances described. All the staircases, corridors and floors are fire-proof, being constructed of concrete and steel. A lounge and a refreshment room are provided on the grand circle level measuring 34ft. by 28ft., and on the balcony level there is a crush-room 44ft. by 21ft. Another addition to the means of entrance and exit is a corridor 7ft. wide, running round the hall on three sides of each level. From this seven separate entrances lead to seats blocked and lettered in both area and grand circle. There are five separate entrances to the balcony. Externally the portion opposite the stage is circular. The shape of the site is irregular, the sides being parallel for a portion of the length. finishing in a long wedge at one end. Around this wedge the ground rises from Commercial Street to Fountain Street 12ft. in the width of the building. Advantage has been taken of the outine to arrange a semi-circular principal entrance, on either side of which there is a lock-up shop 27ft. by 20ft., with access from the entrance vestibule. There are six shops, with work-rooms above and cellaring underneath, each being 22ft. by 17ft. and fronting to Commercial Street. The circular corner has afforded an opportunity to provide a lecture theatre on the first level. This room is approached by two entrances from the approach to the grand circle. It is 56ft. in diameter and has accommodation for 360 persons. Immediately below, in the basement, is a restaurant, 17ft. by 17ft., with a cooking kitchen. The entrance to the restaurant will be from Commercial Street. Provision is also made for the officials. The decorations, both in the principal entrance, the vestibule, the lecture theatre, and the large hall, are in varying shades of rich cream pale blue and gold. No stencilling whatever has been done. The effect has been produced by the ornamentation in the fibrous plaster and by the harmony of colour. The cost has been not quite £30,000, including the cost of the site. The work has been carried out by the following firms:—Painting and decorating, Messrs. Jonas Binns and Son, Halifax; the mosaic flooring in the grand hall, Messrs. Maw and Sons, Jackfield, Salop; the glass dome over the grand staircase, Mr. W. Pape, Leeds; the wood-block flooring, Mr. J. Nightingale, Grimsby; terrazzo and concrete, Messrs. G. Greenwood and Son, Halifax; masonry and joiner work, Messrs. J. Charnock and Sons, Halifax; plumbing and heating, plastering, and slating, Messrs. J. Bancroft and Son; fibrous plastering and modelling, Messrs. J. Binns and Son; seating in the grand circle, Mr. W. Lazarus, London; area seating, Messrs. T. Simpson and Sons, Limited, Halifax; steel-work for flooring, Mr. John Berry, Halifax; steel cantilevers and roof, Messrs. Handyside and Co., Limited, Derby. The whole premises are lighted by electricity, the consulting engineers for this part of the work being Messrs. Shepherd and Whatney, London, and the contractor, Mr. Harry Wright, of Halifax.

Seaforth.—The new Catholic church dedicated to Our Lady Star of the Sea was recently opened. The new church, which has accommodation for 600, is situated on a corner site on the north side of Church Road and the west side of Crescent Road, Seaforth, the main gable facing south towards Church Road. It consists of naves and aisles, apsidal chancel, and two side chapels, baptistery, antechapel, and three porches, together 125ft. long and 55ft. wide, with three confessionals, priests' and boys sacristies, and passage behind the chancel for convenient access from the sacristies. Above the antechapel and porches are a choir gallery and organ chamber, separated from the nave by a stone screen with traceried balustrade. The nave arcade is supported by granite columns, with carved capitals. Above these, springing from carved corbels, granite shafts are carried up to the roof. The nave is lighted by large traceried windows. The roof is carried up by hammer-beam principals with traceried spandrels, &c. The chancel floor, of oak parquetry, is raised six steps above that of the nave. A lofty arch divides the chancel from the nave, and beyond it, the chancel shows five large traceried and gabled windows, three of which are filled with stained glass by Messrs. Hardman, of Birmingham. The church is lighted by electricity, and warmed by low-pressure hot water pipes. Externally, the church is built of Parbold stone, with Runcorn stone dressings. The south gable is divided into two bays for the greater part of its height, with statue niche in centre between two traceried windows, and rose window above. At the south-east corner of the church a tower and spire are intended, but these are at present completed only as high as the nave. Messrs. Sinnott, Sinnott and Powell, of Liverpool, are the architects; Mr. Williams, Seaforth, clerk of works; and Mr. W. Winnard, Wigan, the contractor. The contract amount is between £10,000 and £11,000. The greater part of the carving has been executed by Mr. P. Honan, of Liverpool.

Springvale, Ardrossan.—A new Infectious Joint Hospital for Ardrossan and Saltcoats was opened recently for the reception of patients at Springvale. The site lies about equidistant from the centres of the burghs, is well situated on the higher ground behind Saltcoats, and has a pleasant southern exposure. The buildings are four in number and are designed to accommodate nominally fourteen patients with the necessary staff; in the event of an epidemic, however, this number may be doubled without unduly crowding the wards. The administrative block provides accommodation for a matron, four nurses and two servants, and has kitchen offices of sufficient size to do the culinary work for the whole establishment. The ward block is divided into three sections, thus allowing for the treatment of three distinct infectious diseases. Each set of wards has its own nurses' duty room, bath room, &c., and is entirely disconnected. The wards are well ventilated and heated by hot-water radiators in addition to the fireplaces. All the sanitary fittings are of the most modern description. The laundry and discharge block contains a well-lighted wash-house and laundry with drying-room attached, boiler-house, mortuary and visitors' room, ambulance house and disinfecting rooms. Connected to this building are the rooms where the patients are discharged, being bathed and supplied with clean clothing before leaving the premises, thus guarding against the carrying away of infection. The porter's lodge, which is situated at the gates, is a compact little cottage and controls the access to the grounds. The drainage is carried out on the most approved principle, with inspection eyes at every change in direction so that any portion of the system may be easily examined. The sewage is treated before leaving the site by the septic tank system, the apparatus being designed and supplied by the patentees, Messrs. Cameron, Commins and Martin, of Exeter. The roads and paths leading to the various blocks have been formed, and the avenue leading to the site has been re-made, lamps have been erected and hydrants provided to cope with any outbreak of fire. The whole work has been carried out from the designs and under the direction of Messrs. Fryers and Penman, architects, of Largs. The contractors for the various works were:—Brickwork, Messrs. Greig Bros., Kilwinning; joiner work, Mr. Thos. Miller, Saltcoats; slater work, Messrs. Hogarth and Co., Ardrossan; plumber work, Mr. T. B Stevenson, Ardrossan; plaster-work, Messrs. Murray and McCallum, Saltcoats; painter work, Messrs. John Gilfillan and Son, Ardrossan; heating, Messrs. Boyd and Sons, Paisley; disinfecting apparatus, The Reck Heating Co., Copenhagen; railings, gates and lamps, Messrs. Frazer Bros., Largs. The clerk of works was Mr. James Potter, Largs. The furnishing, which was arranged by the matron and Mr. Adams, the Clerk to the Joint Committee, has been supplied by Mr. John Fullerton, Saltcoats; the medical appliances being supplied by Mr. Wallace, Ardrossan, under the direction of the medical officer, Dr. Fulton, Stevenson.

LONDON DRAINAGE.

THE PURIFICATION OF THE THAMES.

IN the second of a series of articles in the "Daily Chronicle" on the work of the London County Council, Sir Arthur Arnold gives an interesting account of the improvements effected by the Main Drainage Committee. When the sewerage works were commenced in 1855 the Thames at Westminster was nearly as foul as it was at Barking in 1889—at that time one man earned from two to three pounds a week by skimming the noisome fat from the surface of the river and melting it into a commercial commodity. The London County Council inherited three great sewers on the north side; the high level, commencing at the foot of Hampstead Hill; the middle level, beginning in the Harrow Road; and the low level, following the north bank of the river. Day and night, with no rest or intermission, the sewage of a great part of Western London is pumped at Pimlico into the head of this low-level sewer, whence it runs, a sluggish, loathsome, dreadful stream, confined in an egg-shaped barrel of about 8ft. diameter, to Abbey Mills in West Ham; thence the sewage of all London north of the Thames passes in three barrel sewers of 9ft. each to Barking, the contents of the low-level sewer being lifted by pumps at Abbey Mills. Of main sewers at the present time there are about 180 miles on the north side of the river, and 110 miles on the south side.

In 1855, the sewage of London was largely held in cesspits, and for the rest it flowed into the river in its passage through the City. In that year the main sewers were completed, and the sewage was poured out at Barking and Crossness, with terrible fouling of that part of the stream. In 1886, the Board of Works, alarmed at the condition of the river, spent £80,000 in chemicals, and in vain renewed the attempt in the following year with £42,000 worth of chemicals. The Council now expend about half the latter amount annually for lime and iron, by which the precipitation of the crude sewage is promoted.

During the last five years, the chemists of the Council, first Mr. Dibdin and now his successor, Dr. Frank Clowes, have been making experiments as to filtration through coke-breeze, or other material, of this effluent, and the Main Drainage Committee will soon have to consider whether the experimental stage should now be closed, and filtration recommended as expedient for further purifying the sewage effluent. It has been found that a coke filter of one acre in extent, with a depth of about 3ft., will purify a million gallons of sewage per day. For filter beds about 300 acres of land divided between the north and south sides of the river would be required, and this purchase, together with the construction of the filter beds, would perhaps cost little less than £2,000,000. It may be that some other method of improving the effluent will be preferred. But there seems to be no room for doubt that if this work were efficiently carried out the Thames would throughout become conducive to fish life, that Hampton may at some not distant date be famous for its salmon, and that anglers may with every prospect of good sport ply their gentle craft from any part of the Thames Embankment.

Engineering Notes.

Bristol Tramways.—The conversion of the old horse lines and the working by electricity and construction of new lines have cost £650,000.

Heaton Park Liberal Club, Manchester.—This building has just been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

The Wath and District Joint Infectious Hospital is being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Ipswich Dock Improvement.—The Ipswich Dock Commission have decided to complete the tramway round the dock in pursuance of the powers obtained by an Act of 1898. The estimated cost of the work is £50,000.

A new Carmarthenshire Bridge.—The stone bridge erected over the river Bran near Glansevin Mansion by the Llandovery District Council was formally opened last week. It displaces a small wooden footbridge, and has been erected at a cost of £900 by Messrs. Morgan and Sons, of Gwynfe, the architect being Mr. David Isaac, of Brecon.

A French Project.—A project now receiving much attention in France is that for constructing a new railway to enable the existing lines to open up a direct communication with the new route to Italy *viâ* the Simplon Tunnel, now being bored under the Leopontian Alps. France recognises that the opening of the Simplon Tunnel may change the present condition of things in a manner that will be greatly to her advantage, and may restore to her the trade that the St. Gothard took away. Work on the Simplon has been in progress for two years, and has been greatly expedited by the "Brandt drill." Mr. Brandt was a well-known engineer who had had much experience with the St. Gothard tunnel, and he invented a rotary drill of 3in. diameter, driven by hydraulic pressure. The probable cost of the tunnel will be about £2,000,000.

A Model Electric Tramcar.—Last week a model car and the short line laid down in the London County Council's Tramways Depôt in Camberwell New Road were inspected by the members of the Metropolitan Borough Councils. This was to afford them an opportunity of appreciating the details of the conduit system of electrical traction devised by Dr. A. B. W. Kennedy, and provisionally adopted by the Council. The model car is divided into two saloons, capable of accommodating twenty-eight passengers, the seats are comfortable, the gangways wide, the windows exceedingly large; and, further, electric bells have been fixed on both sides of the car, so that passengers can with ease inform the driver when they wish to get out. Outside lights are provided to enable passengers on top to read in the evening, while seats with ingenious covers to protect them from damp in case of rain are a possibility still under consideration. In about eighteen months from the present time it is hoped that at least a part of South London will be provided with electric tramways.

Keystones.

Municipal Buildings at Stockport formed the subject of a Local Government Board enquiry as to an application for sanction to borrow £14,000 for the purchase of a site.

A Memorial to the late Chief Bard Ceulanydd, the Rev. John Williams, has just been erected at the Maesteg-Birthdir Cemetery. It is of polished red Aberdeen granite, about 9ft. high, and massive stone bases bear a square pedestal surmounted by a broken column. The monument has been designed and executed by Mr. T. S. Morris, of Rock Monument Works, Maesteg.

Mr. Walter Crane's Exhibition at Vienna has turned out exceedingly successful. The comments of the Austrian and Hungarian Press (the exhibition has also been held at Budapest) are full of praise. The Austrian Minister of Public Instruction has bought from the collection a number of pictures for the Vienna Modern Gallery and a number of other works of art for the Austrian Museum. The collection now goes to Germany, where several towns are making arrangements to exhibit it.

Lockwood's Price Book for 1901 has been carefully revised and brought up to date. Special attention is given to all new materials and appliances, thus adding to the value and utility of the book. The present issue includes the amended electric lighting rules adopted by the Phœnix Fire Office and the extensive section dealing with electric lighting has also been added to. The book is too well known to need comment. Its price is 4s. and it is published by Messrs. Crosby, Lockwood and Son, of 7 Stationers' Hall Court, Ludgate Hill, E.C.

The Excavations in Pompeii have been carried on steadily during the past year on the northern side of the town, but nothing remarkable has been found except mural paintings, some of which are of great beauty. These have been left *in situ*, as there is no more room for them in the Naples Museum. They are protected as well as they can be, and they are naturally more interesting in their original places than they are when transferred to the Museum; at the same time, they certainly perish and fade more at Pompeii than they do when removed to a drier situation in the Naples Museum.

New Public Offices for Calverley are proposed to be erected, and plans have been prepared. On the ground floor are shown an office for the clerk and collector, and one for the surveyor. On the first floor is shown a council chamber, measuring 26½ft. by 16½ft. and 13ft. high. On this floor are also a store-room for books and documents of the Council, a cloak-room, and the necessary sanitary conveniences. A house is also provided for one of the officials. Application will be made to the Local Government Board for sanction to borrow the sum of £3,500 for this and other improvement works.

The Bristol Society of Architects held its ordinary monthly meeting last week, Mr. F. W. Wills being in the chair. Before the business of the meeting, the president alluded to the death of Queen Victoria, who, as patron of the Royal Institute of Architects and the donor of an annual gold medal for the promotion of architecture, was directly connected with the profession. Mr. C. H. Samson, F.R.I.B.A., of Taunton, read a paper on "Church Restoration" which dealt with the practical work of church restoration as applied to the fine old village churches to be found in West Somerset. The lecturer strongly advocated the preservation of all old work, and insisted that any necessary new work should be simple in character and of the very best materials.

The Sheffield Society of Architects and Surveyors held a meeting last week, the President, Mr. Joseph Smith, being in the chair. The winners of prizes in the competition promoted by the Society for measured drawings of old buildings in the neighbourhood of Sheffield were announced. Mr. H. W. Inott won the society's prize of three guineas, and the president's prize of five guineas; Mr. J. Miller the second prize of two guineas, and Mr. E. R. Bower's drawing was highly commended. The drawings will be displayed in the Montgomery Hall at an early date. It was unanimously decided to forward an address to his Majesty, expressing their heartfelt sorrow at the lamented death of her Most Gracious Majesty Queen Victoria. Mr. H. H. Statham gave a lecture on "Our Cathedral Fronts: a Comparative Criticism."

Ayr new Town Hall Competition.—The Town Council at its last meeting received the report by Mr. John J. Burnet, A.R.S.A., Glasgow, on the designs submitted in competition for the restoration of Ayr Town Hall. Mr. Burnet reported that the arrangements, both of the Court-house and police department and of the hall in No. 1 design, appeared to him so good that he had no hesitation in placing it first. The Council unanimously adopted the recommendation of the assessor, and resolved to proceed with the erection of the hall. The successful design is that of Mr. J. Kennedy Hunter, architect, Ayr, and the cost of carrying it out will, according to the estimate of the measurers, Messrs. Douglas, Hunter and Whitson, Glasgow, amount to £9,515. The hall, with its principal accessories, will be comprised within the four walls of the original building, and its total seating accommodation will be 1,078. In connection with the police office, a new Court-room is to be provided, and there are also to be matron's room, production room, chief-constable's room, superintendent's room, and muster room.

Cardiff's New Asylum, the result of the competition for the plans of which was announced in last week's issue, is designed to receive 800 patients, and to be erected at a cost of £194,000. The architects are Messrs. Oatley and Skinner, of Edinburgh Chambers, Bristol, who designed Winwick Asylum in Lancashire at a cost of over £300,000, and the Croydon Asylum at a cost of £150,000. The structure will be rigidly plain. It will have overhanging eaves and will be constructed with red bricks, relieved with white or yellow bricks. Provision is made for an extension of the building and its accommodation to the extent of 1,250 patients; while the administrative block will be suitable to receive the whole of the staff for the larger building. The competing architects were required to send an estimate of costs for the first scheme and the extension, and these were arranged as follows:—

	For 800 patients. £	For 1,250 patients. £
Wells and Anderson	238,000	295,000
Greenaway and Newbury ..	226,000	300,000
Hooley and Sander	215,000	263,000
Law and Allen	208,000	251,000
Oatley and Skinner	194,000	235,000

Messrs. Oatley and Skinner estimate that the plans will not be ready for tenders before 18 months, of which time something like nine months will be taken up in corresponding with and the passing of the plans by the Lunacy Commissioners and the Local Government Board.

The Restoration of Macclesfield Parish Church is practically complete. The work has been carried out upon plans by the late Sir Arthur Blomfield, A.R.A., and has cost over £20,000. A Burne-Jones window for the Salvage Chapel has been given by Sir Thomas Wardle.

All Saints' Mission Church, Bradeley, near Smallthorne, was dedicated recently. The new church is a brick building to seat 190, from plans by Messrs. Wood and Hutchings, architects, of Burslem and Tunstall, the work being carried out by Mr. J. Longden, of Dale Hall, Burslem.

Swinton Public Baths Competition.—The Baths and Electricity Committee of the Swinton and Pendlebury Urban District Council have considered three competitive designs submitted for the proposed baths in Pendlebury Road, Swinton, and have decided to recommend the Council to adopt the design submitted by Mr. T. J. Bushell, architect, of Manchester, at a cost of £4,725. It is expected that application will shortly be made to the Local Government Board for sanction to a loan to purchase the site and erect the baths.

Local Government Annual, 1901.—The tenth issue of this handbook has just been published. The directory portion of the book has been amplified, and now provides ready means of reference to all branches of local government. The directory portion gives the names and addresses of the chief officials of all corporations, County Councils, &c., throughout the kingdom, and the abstract of the Local Government legislation of 1900 cannot fail to be of service. This year the book is sold at 1s. 6d. It is published at 2 Dorset Street, Fleet Street, E.C.

Metallic Decorations.—Messrs. B. Dellagana and Company, Limited, of 11 Shoe Lane, Fleet Street, E.C., are introducing a new form of metallic decoration. It consists of a electro-deposit of copper on a modelled surface of plaster, ware, wood or similar materials, and in conjunction with Messrs. George Roselieb and Son, of Kennington, a provisional patent has been obtained for a new process of producing high-relief undercut metal work. The electrical deposition of metals is of course no novelty, but Messrs. Dellagana feel satisfied that there is a market for their invention, which embodies the action referred to.

Three new Panels.—Mr. John Baker has introduced at Sledmere Church, Yorks, three panel designs commemorating current events. The first has for her late Majesty a mediæval crown (surmounted by the orb), interlaced by the V. monogram and a sceptre. Passing from behind is a scythe cutting through the V. and the sceptre. Inscribed on scrolls is—

AN. REG. LXIV. JAN. XXII. OBIIT.

The second panel bears the inscription—

A.D. MCMI.
VICTORIA OBIIT.
EDWARD VII. REX.

The third panel has crown and orb, like the first, two sceptres crossing behind, and the inscription—

EDWARDUS VII.
REX FACTUS EST.

Twelve Artizans' Dwellings at New Beckton have been erected by the East Ham District Council. These dwellings have been erected as an experiment, and if they can be made to pay, the Council have decided to proceed with the erection of 87 double-tenemented dwellings. Land has been purchased and propositions have been made for the erection of 255 houses in all. The houses now ready for occupation have cost about £450 each, and the scheme at first provided for each house to be let at a weekly rental of 11s. 3d. But at the last meeting of the committee the surveyor submitted particulars showing that there was a necessity for raising the rents, and the chairman of the committee explained that the state of the money market had necessitated the borrowing of money at 3¾ per cent., instead of 3 per cent., as had been estimated, which made a difference of 10d. a week in the rents. The poor, general district and water rates, and property tax were also responsible for a difference of 1s. 7d.

A new Board School at Lampeter is to be erected.

The Bristol Police Courts are to be extended. A site is being purchased at a cost of £5,025.

Buckingham Palace stands upon the site of the famous Mulberry Gardens, planted by James I. for the cultivation of silkworms. Later on these gardens became a fashionable resort, in fact the Cremorne of the seventeenth century. Buckingham House was built upon the site of Arlington House by the Duke of Buckingham.

Artisans' Dwellings at Stafford.—A Local Government Board enquiry was held recently into an application by the Stafford Town Council for the approval of the appropriation of land in Crooked Bridge Road as a site for the erection of thirty-one artisans' dwellings, and for sanction to borrow £6,500 for the erection of the dwellings.

Mr. William Johnson, of Howden, died last week, at the age of 71 years. In his earlier life he was assistant overseer and assessor of the township, but for many years past he was engaged in his profession of architect, surveyor, land agent and valuer. He was agent for Mr. Walter Freeman's Howden estate and held several other appointments.

A Bronze Statue of Queen Victoria standing in her royal robes, with crown and sceptre, has been unveiled at Hove. It was intended to commemorate the sixtieth anniversary of the accession of Queen Victoria, and is from a design by Mr. Thomas Brock, R.A. The pedestal is of Aberdeen granite, the sides of which contain bronze panels emblematical of Empire, Education, Art and Science, and Commerce.

In Holy Trinity Church, Windsor, a baptistery has been constructed as a memorial of the Rev. Arthur Robins, formerly rector of the parish. The chamber, which is in the Gothic style and is situated at the south-west end of the church, has open carved oak windows on its east side. The font stands in the middle of the tesselated pavement, and around the upper part of the walls is an inscription.

Public Baths at Bradford.—Mr. A. H. Tiltman, the consulting engineer to the Bradford Corporation, has arranged to supply the Local Government Board with plans of the proposed new central baths at the corner of Morley Street and Chester Street, which are to be so constructed as to be available in the winter months as a hall of assembly. In order to ascertain the nature of the foundations, borings have been commenced.

The Embroidering for the Queen's Chair of State for the opening of Parliament was done at the Royal School of Art Needle-work. The work is an exact reproduction of that on the throne occupied by her late Majesty at high Parliamentary functions during the last forty years. The back shows the quarterings of the Royal arms in gold and coloured silk on a ground of deep crimson velvet; and the Irish harp in gold silk with silver strings on a ground of deep sapphire blue velvet. The seat is richly embroidered, the Tudor rose in the centre worked in gold silk, and surrounded by a wealth of ornament in leafage, wild rose, and shamrock. For the other two Royal chairs, smaller than those of the King and Queen, a ducal crown was worked in gold silk.

Mr. Henry Willis who died on the 11th inst. was familiarly known as "Father Willis," on the analogy of "Father Smith," of whom he was a worthy successor in the art of organ-building. He was born April 27, 1821. Mr. Willis's first important step in the career of an organ-builder was the reconstruction of the organ of Gloucester Cathedral in 1847. The instrument shown at the Great Exhibition of 1851 brought Willis's work into prominent notice, and he was chosen to build the famous organ for St. George's Hall, Liverpool. Another organ, exhibited in 1862, was destroyed by fire at the Alexandra Palace in 1873; but the instrument by which Londoners know Willis best is the huge organ at the Albert Hall, opened 1871. Among the cathedrals of which the organs have been restored by Willis are Winchester, Carlisle, Wells, St. Paul's, Durham, Salisbury, Hereford, Oxford, St. David's and Canterbury.

Archæology in Greece.—The divers at Cerigo have discovered further statues, which cannot, however, be brought to the surface without improved apparatus. M. Caradias, Inspector-General of Antiquities, speaking before the Archæological Association at Athens on the recently discovered bronze statue of a youth expressed the opinion that it dates from the period of Phidias. It was the most perfect and beautiful relic of antiquity yet brought to light. The Minister of Public Instruction is going to Cerigo to superintend the researches.

New Companies.

H. Wheatley Limited.

Registered February 4th to carry on the business of carmen, builders, contractors, &c. Capital £100 in £1 shares. Registered office: 10-22 Windmill Road, Chiswick, Middlesex.

Howley Park and Great Tinsdale Quarry (Morley) Company, Limited.

Registered February 4th to acquire the business of the Howley Park Co-operative Quarry and Building Society, Limited. Capital £20,000 in 25s. shares. Registered office: Britannia Road, Morley, Yorkshire.

Armstrong's Brick Company, Limited.

Registered January 19th, to take over the business of a brickmaker, coal merchant, &c., now carried on by T. Armstrong, at Kingsthorpe, Northampton. Capital £6,000 in £1 shares. Registered office: 4 Hope's Place, Kingsthorpe Road, Northampton.

W. W. Jacques and Co., Limited.

Registered January 18th, 1900, to acquire the business carried on at 10 Parson's Green, Fulham, as W. W. Jacques and Co., and to carry on the business of stonemasons, builders, contractors, carmen, brick, timber and hardware merchants, &c. Capital £1,000 in £1 shares.

Cobridge Hall Fire-Clay and Marl Co., Ltd.

Registered February 4th to carry on the business of miners, quarry owners, brick makers, &c. Capital, £8,000 in £1 shares (4,750 preference). The first directors are Walter de Wolf and Thomas E. Storey. Registered office: Cobridge Hall, Sneyd Street, Cobridge, Staffordshire.

New Llandudno Junction Brick Syndicate, Ltd.

Registered February 8th to carry on the business of brick, tile, pipe, pottery, earthenware paviors, artificial stone makers, manufacturing chemists, &c. Capital £4,000 in £10 shares. Registered office: Wynnstay Chambers, Conway Road, Colwyn Bay, Denbigh.

Musson Pencil Company, Limited.

Registered February 6th to acquire from F. W. Musson, of 21 Great College Street, Westminster, certain existing inventions relating to improvements in pencils. Capital £6,000 in £1 shares. The first directors (to number not less than three nor more than five) are A. E. Hitchcock, J. K. George, and F. W. Musson. Qualification, 200 shares. Remuneration as fixed by the company.

Non-flammable Wood and Fabrics Co., Limited.

Registered January 12th, to acquire all or part of the business of the British Non-flammable Wood Company, Limited, and the London Non-flammable Wood Company, Limited, or either of them, to treat wood, fabrics and substances so as to render them incapable of supporting or spreading flame, and to carry on the business of timber merchants, saw-mill proprietors, wood-workers, carpenters, joiners, builders, shipowners, chemical manufacturers, and merchants, &c. Capital £195,000 in £1 shares. Registered office: 2 Army and Navy Mansions, Victoria Street, S.W.

COMING EVENTS.

Wednesday, February 20.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary meeting at 8 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—Mr. A. H. Barker on "Works Management—II.", 8 p.m.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

SOCIETY OF ARTS.—Mr. Frederick McDermott on "Some Features of Railway Travelling, Past and Present," 8 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. J. Priestley, B.A., M.D., M.R.C.S., on "Duties of a Sanitary Inspector: General, (B)—Indoor,' 7 p.m. Inspection and demonstration in the district of St. George's, Hanover Square, 2 p.m. Conducted by Mr. Albert Taylor.

RUSKIN SOCIETY OF BIRMINGHAM.—Miss May Morris on "Patient Grizzel: some phases of women's life in mediæval times," 8 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Mr. W. Ferguson Irvine on "Some Old Halls in Wirral," 8 p.m.

Thursday, February 21.

CARPENTERS' HALL, London Wall.—Mr. H. Heathcote Statham on "Architecture at the Paris Exhibition," 8 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Mr. W. L. Magden on "The Electrical Power Bill of 1900: Before and After," 8 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

SOCIETY OF ARCHITECTS.—Mr. G. A. T. Middleton on "The Architecture of the Nineteenth Century," 8 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

NATIONAL SOCIETY FOR CHECKING THE ABUSES OF PUBLIC ADVERTISING.—General Meeting at the Society of Arts' premises, 5 p.m.

Friday, February 22.

PHYSICAL SOCIETY.—Meeting at 5 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. John G. Dunn on "The Practice of Chimney Building and Boiler Setting," 8 p.m.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. J. Osborne Smith on "Domestic Heating, Ventilation and Lighting," 7 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. J. Priestley, B.A., M.D., M.R.C.S., on "Duties of a Sanitary Inspector (C)—Offensive Trades and Trade Nuisances," &c., 7 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Professor Beresford Pite on "Stonework," 6.45 p.m.

ROYAL INSTITUTION.—Sir W. Roberts-Austen on "Metals as Fuel," 9 p.m.

INSTITUTION OF CIVIL ENGINEERS (Students' meeting).—Mr. J. L. Cridlan on "Automatic Couplings," 8 p.m.

Saturday, February 23

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at Friern Barnet Sewage Works at 3 p.m., conducted by Mr. E. J. Reynolds, A.M.I.C.E

DUNDEE INSTITUTE OF ARCHITECTURE.—Visit to General Accident Assurance Buildings, &c., Perth, at 12.45 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Bruntsfield House and St. Oswald's Church.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Annual Dinner, King's Hall, Holborn Restaurant, 6 p.m.

Monday, February 25.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Announce Royal Gold Medallist. Address to Students by Mr. William Emerson, President. Criticism of the Designs and Drawings submitted for Prizes and Studentships, by Mr. J. Alfred Gotch. Presentation of Prizes, 8 p.m.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. Henry R. Kenwood, M.B., D.P.H., on "Infectious Diseases," 7 p.m.

ROYAL INSTITUTION.—Professor J. A. Ewing on "Practical Mechanics," VI., 3 p.m.

PHILOSOPHICAL SOCIETY OF GLASGOW: ARCHITECTURAL ASSOCIATION.—Professor Henderson, B.Sc., M.A., on "Chemical Notes on Building Materials," 8 p.m.

Wednesday, February 27.

EDINBURGH ARCHITECTURAL SOCIETY.—Mr. Percy E. Nobbs, M.A., on "Why we go to Italy,' 8 p.m.

SOCIETY OF ARTS.—Dr. W. Schlich, C.I.E., on "The Outlook for the World's Timber Supply," 8 p.m.

CONTRACTS OPEN.

BOROUGH of CAMBERWELL.

ANNUAL CONTRACTS.

The Works and General Purposes Committee of this Council will meet at the Town Hall, Peckham Road, on MONDAY, the 25th day of FEBRUARY inst., at SEVEN o'clock in the evening precisely, to receive TENDERS for the requisite MATERIALS and WORKS in connection with the following: Guernsey Granite, Croydon and Kent Flint, Kentish Rag Stone, Paving Stone, Thames Ballast, Tarpaving, Asphalting, Lime and Cement, Timber for Wheelwrights' Work, Harness Leather, Materials and Fittings, Loin Cloths, Sacks, &c., White and Red Lead, Paniters' Sundries, Oilmen's Sundries, Lard Oil, Tallow, Candles, Soap, &c. Hire of Drivers, Horses, Carts, &c. Brooms and Brushes, Shovels, Pickaxes and other Tools, Shoeing and Bar Iron, Steel, &c. Coach and General Ironmongery, Gas Fittings, Tyreing, Coal and Coke, Clock Winding, &c.

The Public Health Committee of this Council will meet at the Town Hall, Peckham Road, on TUESDAY, the 26th day of FEBRUARY inst., at SEVEN o'clock in the evening precisely, to receive TENDERS for the SUPPLY of DRAIN PIPES, SEWER IRONWORK, and also for the SUPPLY of CARBOLIC POWDER, DISINFECTANTS, &c.

Forms of Tender and all particulars may be obtained from the Borough Engineer, Mr. W. OXTOBY, Town Hall, Peckham Road, Camberwell, and no Tender will be received except on such form.

Tenders are to be delivered at the Town Hall, Camberwell, at the times and dates first above-mentioned, when Contractors or their Agents are required to be in attendance.

The Council does not bind itself to accept the lowest or any Tender.

Approved sureties will be required for the due performance of the contract.

Persons tendering must comply with the conditions as regards rates of wages and hours of labour as contained in the form of contract and schedule annexed to the Tender.

By order,
C. WILLIAM TAGG,
Vestry Clerk.

Town Hall, Camberwell,
February, 1901.

TO BUILDERS and CONTRACTORS.

The Feltham School Board are prepared to receive TENDERS for the ERECTION of a NEW INFANTS' SCHOOL, on the Cardinal Estate, Feltham, about 50ft. from the present infants' school.

Plans, specifications, conditions of contract, and quantities, may be seen at the office of Mr. W. RALPH LOW, architect, 10 Basinghall Street, London, E.C., between the hours of TEN a.m. and SIX p.m. Saturdays TEN a.m. to TWO p.m. Copies of quantities can be obtained upon payment of a deposit of Two Guineas, which deposit will be returned on receipt of a bonâ fide Tender on the form supplied with the quantities.

Tenders to be delivered, on the forms supplied, at the office of the Clerk to the Board on FRIDAY, MARCH 22nd, 1901, not later than TWELVE noon, marked outside "Tender for Infants' School."

The Board do not bind themselves to accept the lowest or any Tender or to defray any expense in connection with tendering, and whatever Tender may be selected will be subject to the approval of the Board of Education before its acceptance.

Substantial sureties will be required for the due fulfilment of the contract.

By order,
OSWALD JACOB,
Clerk to the Board.

Feltham, Middlesex,
February 1901.

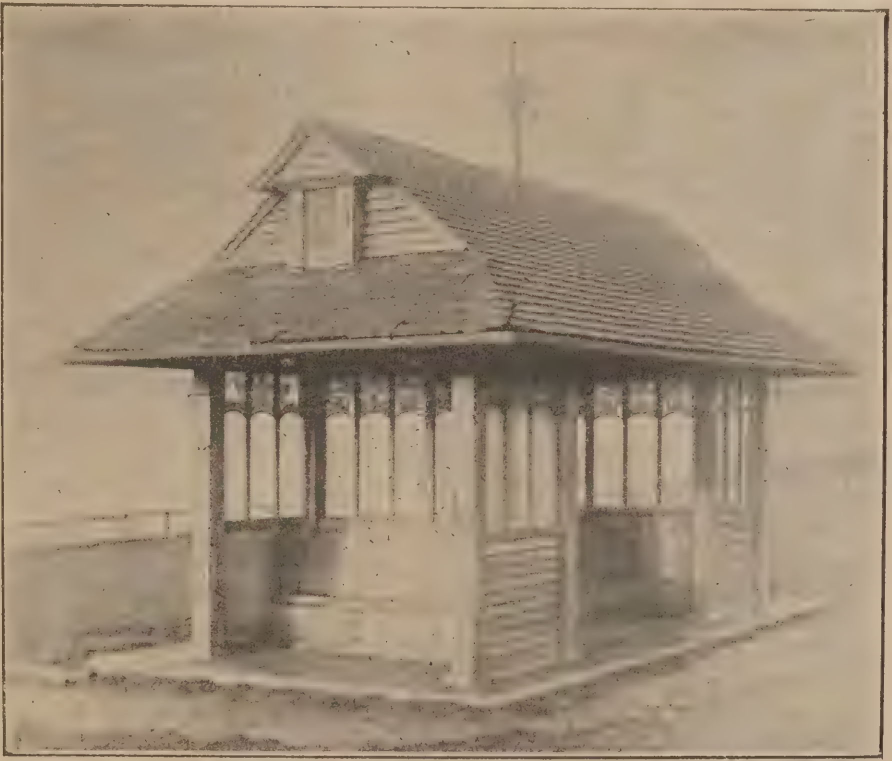
An Architectural Causerie.

Rights Affecting Architectural Drawings. ON referring to page 67 of this issue it will be seen that a correspondent raises a very interesting and important question in regard to the preparation of architectural drawings. Let it be supposed that a so-called architect commissions another man to prepare designs for a hospital competition. These designs gain the first premium and the work is carried out in the architect's name. The question is, can the man who really made the drawings use them for publication as a design apart from the architect, attaching his own name to them and making no mention of the architect? This is our correspondent's case. The point is a nice one and is entirely dependent on the exact conditions under which the work was done. Copyright law is affected, and it must not be forgotten that such law is most abstruse, though Lord Monkswell's Bill has certainly brought order out of chaos. In the case of pictures, at the present time the copyright rests with the artist unless he assigns it in writing. In the case mentioned there appears to have been no agreement in writing, but simply a verbal arrangement by which the one man was to prepare designs for the other at an agreed price. Did these designs so become the absolute property of the architect? We think so. But there is still the question of specific use. Were the designs made for the purposes of the competition only, leaving all other rights in the hands of the author? As no definite statement to this effect is made, we should think not. According to our view of this matter, all the rights became vested in the architect when he paid for the drawings; he practically bought the designs *in toto* and so acquired absolute possession of them. In all cases of this kind particular care should be taken to have an agreement in writing, stating exactly what rights are assigned. An interesting side issue is also raised—that of the architectural "ghost." We have already condemned this practice, by which one man reaps the results of another's handiwork. It has a degrading influence on both, and the evil is accentuated when a so-called architect attaches his name to drawings with which he had nothing whatever to do. The next development will be for certain men to keep designs for hospitals, town halls and free libraries of all sizes and shapes in stock, so that everyone can choose one to meet his own particular needs. A catalogue would also be useful—No. 232. Nice town hall. Brick and terra-cotta. All the latest improvements. Plenty of ornament. Would suit pushing young municipality. Plans sent on approval.—Let architecture be spared this at least.

Public Shelter: Hunstanton, St. Edmunds. THIS shelter has been recently built on the cliff in memory of the late Francis Hewitt of Leicester and Hunstanton, for some time president of the Press Association. It is constructed of English oak and roofed with red tiles. The lead glazing, which represents marine animals, birds and plants, more or less conventionalised, was made by Messrs. Nicholls and Clarke, of London, from designs by the architect, Mr. Herbert Ibberson, F.R.I.B.A. The builder was Mr. F. Southgate, of Hunstanton. Our illustration is from a photograph by Miss G. Hewitt.

London Water Proposals. THE London water companies are very ingenious in their arguments, but they excel themselves in trying to foist on the ratepayers a number of expensive new regulations. It is to be hoped that Mr. Long will quash the scheme. No doubt a large amount of water is wasted, but that is no reason why householders should be compelled (among other things) to provide cisterns, which have proved to be so insanitary in the past. It is well enough to say that these are perfectly satisfactory if cleaned, but they are often not easy to clean, and in many cases are never touched, whether it is easy to clean them or not. Moreover, the water companies want to have a box outside each house so that they can turn off the water when they like; but the consumer prefers otherwise. He does not like to find when he awakes that the water has been turned off for him during the night. No, people have had enough of intermittent supplies, and rightly so. Water supply should be constant, but if the companies manage to have the cisterns replaced in houses they will probably revert to the intermittent supply. It is better to have a waste of water than this: and as regards this waste the companies seem to think that people let their taps run for fun, which is absurb. The London water companies should never have been allowed to obtain the authority they now possess; such power should be taken away from them and the water supply municipalised. These new regulations exemplify the arbitrariness of the companies, who would obtain all the benefits while the consumers were loaded with the expense and inconvenience.



SHELTER AT HUNSTANTON. HERBERT IBBERSON, F.R.I.B.A., ARCHITECT.

The Preservation of Stonehenge. IT will be remembered that a short time ago two stones fell at Stonehenge, one being smashed. Several suggestions were made for the preservation of the whole group, and the matter is now receiving the consideration of a committee of well-known archæologists, in whose hands we are sure no vandalism will be permitted. Perhaps the most interesting letter that has recently appeared on this subject comes from Professor Flinders Petrie, who is now in Upper Egypt restoring the beginnings of the oldest known civilisation. He says in the "Times" that Stonehenge is the most impressive sight in England, "and on no account should it be destroyed by a hideous iron railing, such as now defaces Kits Coty house." In his opinion it would be of no benefit to the appearance of the place or to archæology if every stone that has fallen were re-erected. The real effort should be to save those now gradually yielding over, especially the largest stone of all. "When leaning stones have been pushed up into place, then all the unstable ones should have a concrete bed filled in, below the turf level, as I proposed twenty years ago. The whole soil under a stone might be removed while the block was clamped in a timber frame." We entirely agree with this scheme, as it is certainly the most effective way of dealing with the stones: it is always the foundations that need primarily to be made sound. Such work as that proposed would afford the chance for a historical research. The Professor says that not a handful of soil must be moved except under the instant inspection of a good archæologist, who must live in a shed at the site. There must be no driving up each day from an hotel at Salisbury, to find that the workmen have finished with the historical evidences before breakfast. The workmen must be trained hands, and full local value must be paid to them for everything they find; there must be no chance tales a year or two later about so-and-so having got prizes from the excavations. A perfect record of every scrap, even of pottery, must be kept, and the ground cut away in such measured slices that the place of every object is known to an inch. The public must be kept out from all interference with the portion being worked, and no festive luncheons and notabilities must be allowed to distract the recorder for a moment. Professor Petrie speaks from a bitter experience no doubt, and we hope that, as he suggests, he will be able to co-operate in a plan for the thorough repair of these wonderfu stones of Stonehenge.

Mr. Balfour's Scheme. WE should have thought Mr. Balfour would have had more sense than to suggest, as a solution of the housing problem, "a system of radiating thoroughfares, confined to traffic running at the rate of fifteen miles an hour or over—this is absolutely essential—and with a surface designed, not for carts or horses, but for some form of auto-car propulsion." We certainly believe that the solution of the housing problem lies not inside the city but outside, means of quick transit being essential; but what corporation is likely to attempt such a scheme as Mr. Balfour's? In the first place it would mean the demolition (in London, at an enormous expense) of a great amount of valuable property in order to form these "radiating thoroughfares," and in the second place we do not think it practicable for dozens of motor-cars to be rushing along beside or behind one another at a speed of nearly twenty miles an hour. At the present time the numerous railways afford ready means of transit and the companies should be compelled to issue tickets to workmen at cheaper rates and establish a more constant service. Horse trams are of little use, their speed being altogether inadequate: horse 'busses are a little better; but rapid electric cars are needed to supplement the railway service. It is useless to suggest a scheme like Mr. Balfour's.

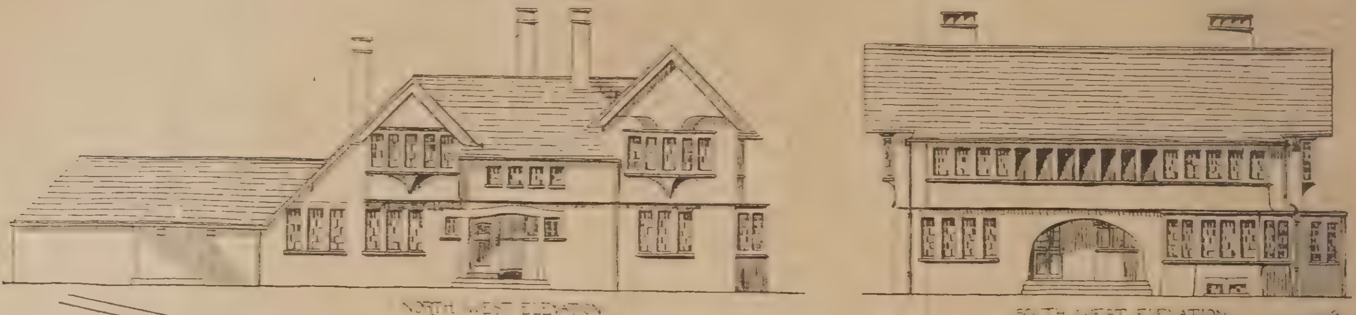
THE ART OF DESIGNING SMALL HOUSES AND COTTAGES.*

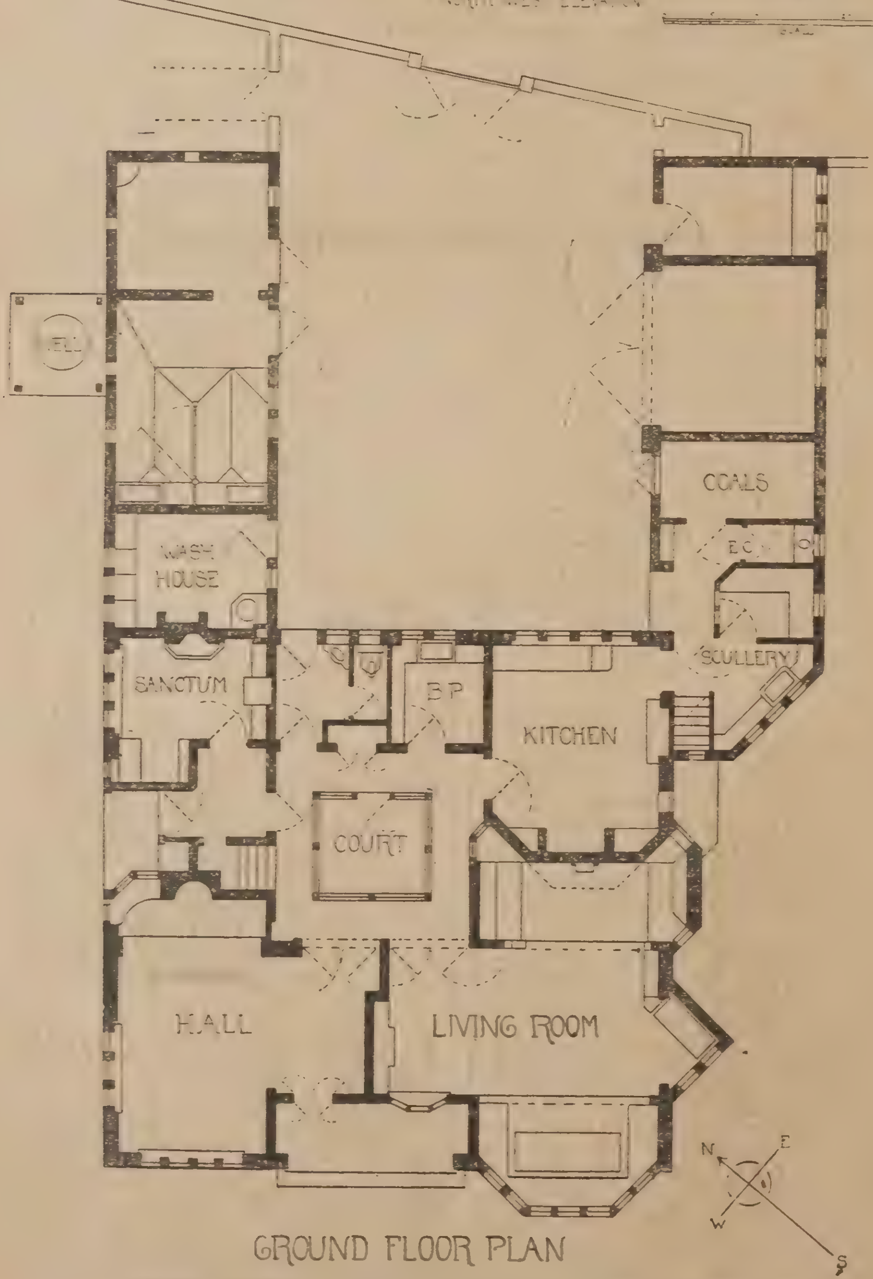
By BARRY PARKER AND RAYMOND UNWIN.

IN no house can every advantage be obtained; each must be somewhat of a compromise; in each there must be a sacrificing of what we deem the less important to secure what we esteem of greater value. It follows that the variety of our attitude must produce individuality in the results.

Suppose we have received a commission for a dwelling house. The first thing is to visit the site and devote some time to thinking out the problem on the spot. The site is the most important factor to be considered, for it usually suggests both the internal arrangement and the external treatment. If the site is a large one the position of the house upon it must first be determined. A primary consideration must be to so place the house as to afford its occupants the greatest possible enjoyment of such beauty of adjacent country or grandeur of distant view as the site can command. While doing this, however, we must so place and design the house that it shall not stand out as a disturbing excrescence, but shall look at home in its place, in harmony with its surroundings.

This consideration of the house as a detail in a larger picture will bring us to a determination of its general form, its treatment and its colouring. Some positions demand a lofty building to crown or complete a spur of rising ground, for example, while others seem to suggest that it be kept as low as possible, as when it nestles under some protecting hill-side. And in the country at any rate the low house is usually more successful. Some natural terrace may suggest a long house with all its rooms facing one way, or a ridge may indicate a double-faced house commanding the outlook over each slope, or perhaps a steep hill-side will require a house following its lines and clinging to it storey by storey, while a gentle slope will demand a general grouping of the roofs to give a sense of stability by contradicting it.





GROUND FLOOR PLAN

COUNTRY HOUSE IN NORTH STAFFORDSHIRE. BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.

In the choice of materials and colouring, harmony rather than strong contrast should be sought. There is only one sure way of obtaining this at all generally, which is of course to keep to local materials and local ways of using them. In some places a low-toned colour-scheme, such as stone walls and grey stone or slate roof, seems most fitting, in others the warmth and brightness of bricks and tiles; some invite the homeliness of whitewash, while others suggest the deep colouring of green or purple slate. Whatever it is, some definite colour-scheme should be adopted and colours of paint and any enrichments made to contribute to it.

Greatly as must the site influence the external treatment of the house, its internal arrangement will be even more definitely dictated by it. The position of each room in relation to the points of the compass and the outlook should be determined on the spot. It is now pretty generally realised that no sacrifice is too great which is necessary to enable us to bring plenty of sunshine into all the main living-rooms. The general rule would seem to be, to so contrive as to get the sunshine into a room at the time when it is likely to be most occupied. Let a study or breakfast-room be east or south-east, a general living-room or drawing-room south and south-west. A good western window in the room we most occupy in the latter part of the day gives us many an extra hour of daylight; while the opportunity it affords us of habitually seeing the bright colour of sunset is a privilege which is worth some effort to obtain. A kitchen is best north-east or east, for the first coming down into the fireless house may well have its cheerlessness reduced by what sunshine is to be had at an early hour; later in the day, when the kitchen is hot with cooking, the heat of the sun should not be added. A bathroom and bedrooms too are pleasant with an eastern

---

HOUSE WITH HALL AS CHIEF FEATURE. BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.

aspect, though some cannot sleep in a room into which early sunshine can penetrate.

Next only in importance to such considerations of aspect, and certainly important enough to modify them somewhat, is the question of prospect. For a pleasant outlook is a boon second only to a sunny aspect.

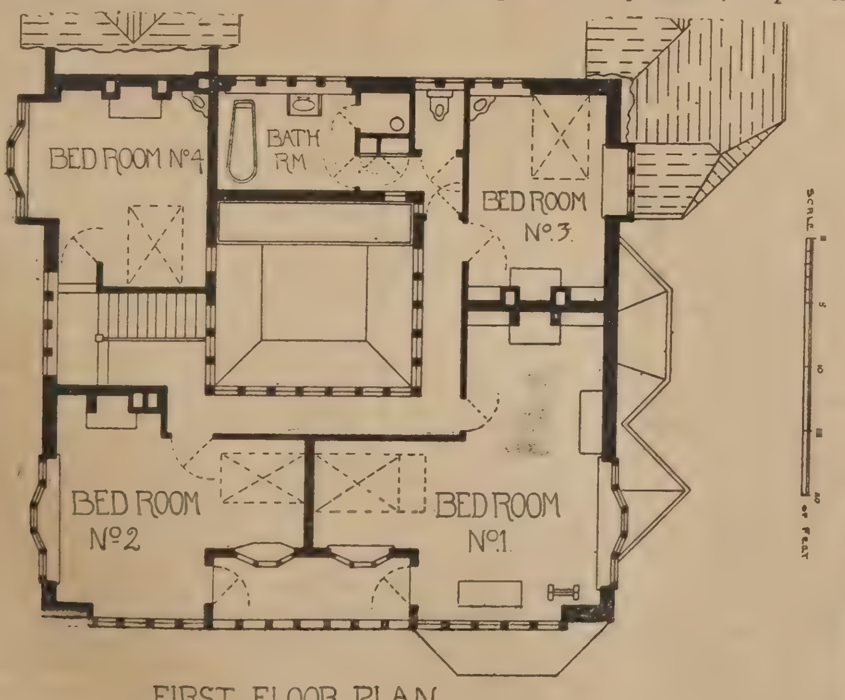
Before leaving the site one should be able to carry away not only detailed notes of drainage, water-supply, levels, fine trees, views and aspects, but also a general idea as to the best arrangement of the rooms of the new house, an ideal plan to be aimed at, and a sort of mental sketch in block of the general form the new creation should take externally.

It would be only tedious to you if I were to go through all the details of a house, trying to deal with them in a general way. I will therefore now take one or two definite examples and explain how and why we worked them out as we did, trusting that the interest which attaches to any active problem solved may come to my aid and redeem the details from tediousness.

We have chosen for the first example a country-house designed for a site in North Staffordshire, partly because the site was not one to very obviously suggest or very imperatively demand a special treatment. The plot of land consists of a small field, long and rather narrow; it is much the shape of a suburban building plot, though situated right in the country (see plan below and on the previous page.

The client required the house to have a good comfortable living-room for the general family life; another good room for entertaining guests and callers; a small den for his own use, with desk, safe, sample cupboards and gun-rack; four bedrooms, one to be a bed-sitting-room for an only son; a kitchen with the usual offices; outside there were to be wash-house, stables, coach-house, &c. The house was to be arranged to give as much open-air life within as possible.

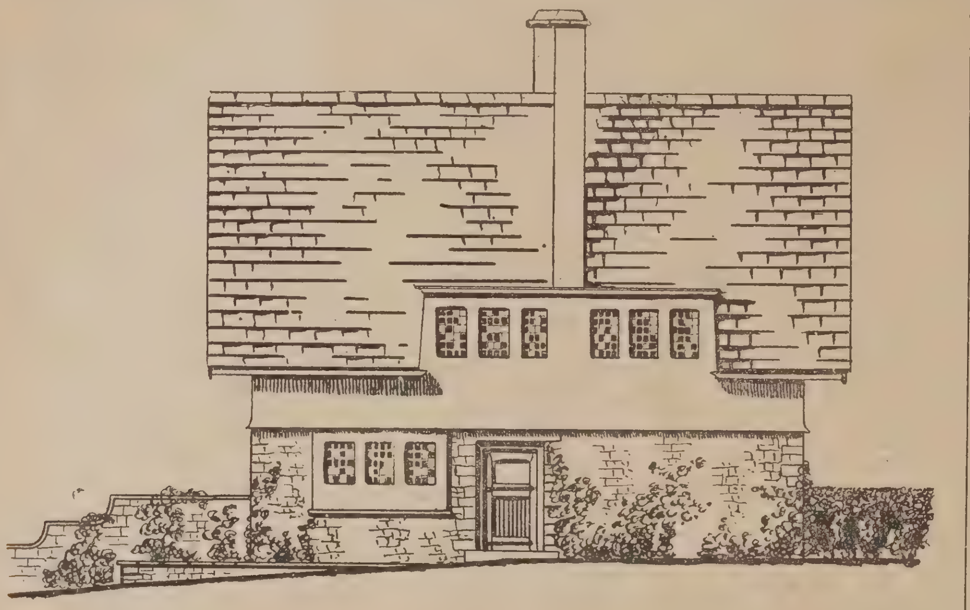
As the site is exposed to the prevailing winds, and the best prospect is in the direction whence they blow, some form of court on to which the rooms might open suggests iftsel as a means of obtaining the needful shelter. The stable yard not being very suitable for the purpose, the house is grouped round a very small central court, round which a corridor is planned fitted with sliding windows, so that it can be converted at will into a sort of small open-air cloister by sliding the sashes down below the sill. This is roofed over at as low a level as possible to avoid anything of the feeling of a well, which a court as small as this needs must be might soon produce. The main roof also is made to slope away from the court in all directions, so that a good deal of sunlight may find its way in. On to this corridor the main rooms open with wide double doors, and the court being protected against wind on all sides it is possible in any weather, except when extremely cold, to have the living-rooms open to the fresh air to a quite unusual extent. The kitchen, butler's pantry, front and side entrances, and stairs all communicate with the corridor, but so as not to destroy the privacy of the living rooms by obliging anyone to pass the doors when going from one to the other. Pleasing vistas are obtained from the rooms across the court, and from the corridor into the rooms, such as it is not often possible to contrive in so small a house. Provision is made in one corner for a ventilating stove to prevent excessive cold draughts in winter.



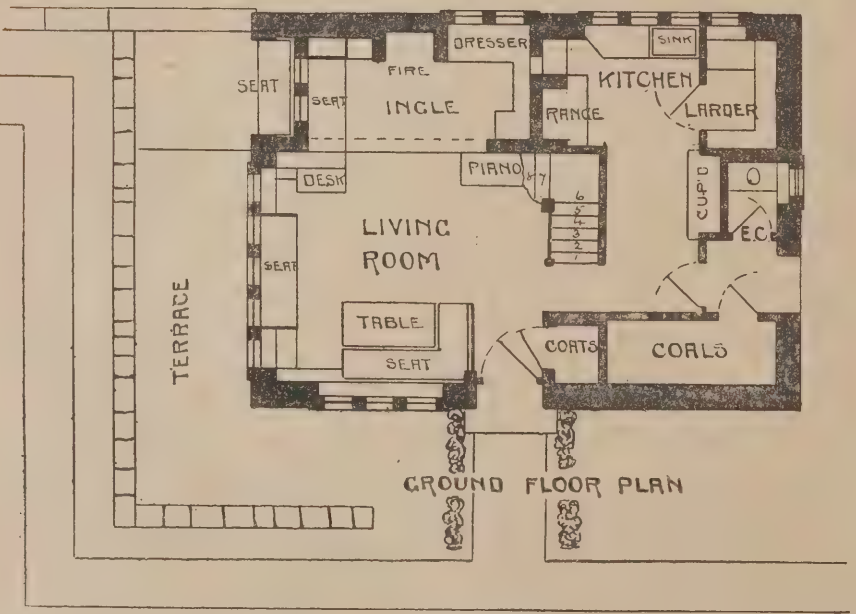
COUNTRY HOUSE IN NORTH STAFFORDSHIRE. BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.

The living-room, as the most generally occupied, and therefore most important room, is placed at the south corner, having the double outlook to south-east and south-west, and getting all available sunlight and the best of the prospect. It is not enough to give a room windows in the right direction, however: the room must be so arranged that it shall, so to speak, turn its right face, and the windows be so placed that they shall be naturally seen out of from the most usually occupied parts of the room. For this reason an angle window commanding the best part of the view is thrown out on the south-east side. The fire is put on the north-east wall, and, so that a thorough sense of cosiness may always be obtainable, it is placed in a deep recess or ingle.

Now an ingle affords a very good instance of how easy it is to misuse the old examples which we study, and that in two directions. For while some neglect altogether the suggestions which they offer, others copy the old forms without troubling to understand them. To make use of old features legitimately, of course one must first understand the reasons which called them into being: the difficulties which they were designed to meet; and when similar



SOUTH ELEVATION



COTTAGE IN DERBYSHIRE. BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.

reasons or difficulties present themselves to us we may then avail ourselves of the solution which they indicate, not copying slavishly the details, but taking the principle and working it out to suit our own particular circumstances. The ingle, of course, had two main uses: the first was to protect a wide open fire from the cross-draughts arising from badly fitting or open doors, shutters and windows; the second was to afford seats near the fire, sheltered from the draughts, where the aged and feeble could rest or anyone could keep warm in cold or rough weather. Incidentally, no doubt, our forefathers appreciated the value of contrast, the charm of the ruddy fire-light space glowing red in the grey ill-lighted building, and the cosiness of the sheltered low recess in the wide and lofty hall. To obtain this charm, as is often done, by forming an ingle so small that one cannot sit in it comfortably, is merely to remove the fire further from the room; while on the other hand, to arrange a large ingle, as is also sometimes done, with a modern tiled register stove set in a chimney breast is to lose the feeling of "sitting on the hearth" and the charm that springs from the fire being able to cast its glow all over the recess, and to be seen from every part where one can sit. To adapt the ingle to rooms of moderate size then and justify the space it occupies, it must be large enough to be comfortably sat in regularly: a place where one can live, not merely go to be roasted. The fire must be so designed as to have something of the feeling of the old fire on the hearth, and must not be cut off from the recess or in any way allowed to grow into a fireplace within a fireplace. It is generally well to make the whole recess into the hearth, and we often arrange for the fire to burn in a suitably-shaped firebrick hollow, which answers all purposes excellently. Fenders are best avoided, and anything like a loose coal-box is a disadvantage. A coal-box can generally be contrived in the thickness of the wall. The ingle must of course be protected from cross-draughts, otherwise the fire cannot be sufficiently exposed. When properly arranged and fitted with comfortable low seats, the ingle always proves to be a favourite part of the room: the place where people naturally go to sit and rest.

But I am digressing from the plan, and must return to the living-room which we are designing. There the ingle is of somewhat special construction, having several small windows to afford peeps out towards the court and the view, and to give light conveniently placed for anyone reading; and also having cupboards for the display of the client's collection of oriental pottery which is being utilised somewhat by way of decoration, where the changing lights falling on its bright colourings will give some additional variety to its beauty. The ingle is made deep enough for the seats to serve for sofas.

As meals will be taken in this living-room, a small dais for the purpose is provided in full view of the fire; and, by the client's wish, the recess for this is made a window recess in the form of a large sunny bay, having fixed seats on three sides of the table. This bay gives us another window facing directly to the best view as well as one to the west, which brings the evening light into the room, while the recess is a great advantage, as it prevents the room being blocked up with the meal table.

Near the door a slight recess is formed for a sideboard; and this end of the room is lighted by a window close by, which opens on to the balcony. A recessed balcony is, in our climate, much more useful than any projecting verandah. It is possible, owing to the extra shelter, to sit in such a balcony two or three times as often as in the verandah with open ends.

In this room all the important furniture forms part of the scheme: it is thought out and designed with the building. In the treatment of the room advantage is taken of the beams and lintels required for the recesses, and where these are lacking a deep picture-rail carrying line with them is adopted, under which the sideboard, cabinet and windows are arranged to finish, leaving an unbroken frieze above and giving a sense of order and unity to the whole. This frieze is decorated with a painted suggestion of landscape, but in simpler treatment if whitewashed, or tinted with the ceiling, would be light and satisfactory. The lower portion of the walls, under the decorated frieze, is finished in plaster tinted to the required shade by mixing colouring matter with the skimming coat.

Where economy is any consideration rooms may be kept as low as possible, giving additional space outwards, which is as valuable as space upwards, for an air reservoir, and for all other purposes so much more valuable. The house being described is 9ft. from floor to floor.

The hall or entertaining-room being intended for less constant as well as more formal use takes a somewhat simpler form. Placed at the west corner with windows south-west and north-west it gets all the sunshine during the afternoon and evening, when it is most occupied. It is placed so as to be immediately accessible from the entrance, and opens on to the balcony with folding doors and window. The fire is placed in an ingle contrived under the stairs and half landing, an arch being used in this case to carry the chimney stack and form the recess. The flue from the fire is brought over on to the arch by means of a copper hood. A little bay partly in the porch lights this ingle. The porch is also arranged under the stair landing, with a seat for a messenger under the stairs.

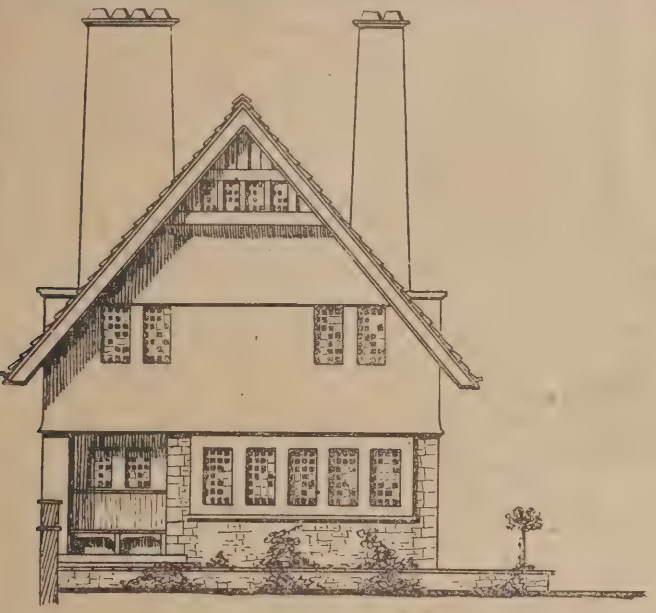
Adjacent to the entrance is the small sanctum. Here, again, something is taken off the square room, which, while improving it rather than otherwise by giving a recess for desk and pigeon holes, enables us to have a small vestibule with cupboard for visitors' hats and cloaks.

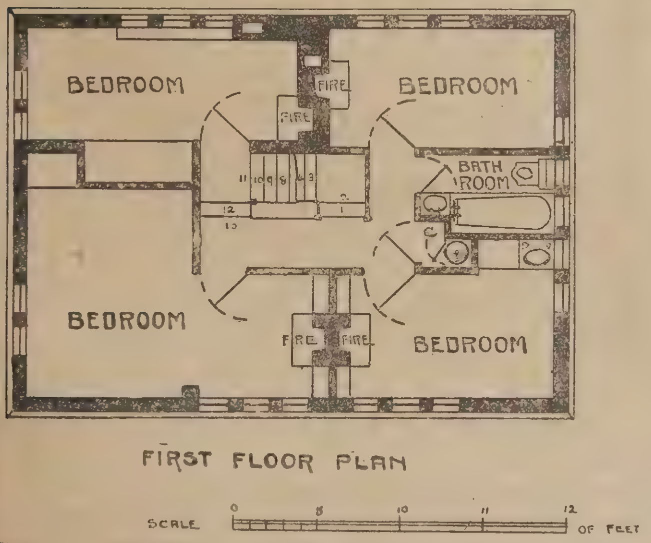
Handy to the entrance and to this room is the main coat-cupboard and the lavatory, from which a side door leads to the stable yard, while the butler's pantry completes this north-east side of the little court. Beyond this and behind the living-room, having its fireplace at the back of the living-room fireplace, is placed the kitchen. It occupies the east corner of the house and has its main window to the north-east, the right aspect for a kitchen. There is a small window to the south-east, to light the range and make it a comfortable place for sewing or reading. One corner between fire and window should always be kept free from doors in a kitchen, so that there may be a place to sit in, and it makes a more comfortable kitchen still where it is possible to collect the doors on one side only. Here an archway, closed by a heavy curtain when work is done, leads to the scullery, cellar, larder and back door.

The larder has its window in the back porch to get a north aspect, while thorough ventilation is secured by an opening on the south-east up under the eaves where the sun cannot reach it. The cellar was added after the preliminary plans were made, the scullery being re-arranged to receive it. This latter is made to obstruct as little as possible the squint window in the living-room ingle, and at the same time gets a south window, which, as there is no fireplace, is a good aspect for it.

The staircase rises from the corridor, and as it is accessible from all parts without passing the doors of the reception rooms, a back staircase is not needed. Where economy is a consideration the back staircase is one of the first things which may be dispensed with, for it adds little real comfort in proportion to its cost.

The bedroom plan follows pretty closely the ground plan, the bedrooms also leading off a corridor round the inner court. The balcony is repeated on the first floor, and, by reason of the parapet and overhanging eaves, it is even more sheltered than that on the ground floor, and makes it possible in two bedrooms to sleep practically in the open air in almost all weathers. It has special value, too, as an addition to the west room, which is designed for the boys' bedroom and study. Here the bed fits in a deep recess out of the way; a wash-stand is contrived in the sill of the window of the same recess, which is slightly bayed to give the needful room, and a curtain may be drawn across, cutting off all the special bedroom appliances, so leaving a good comfortable study.





COTTAGE IN DERBYSHIRE. BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.

The central court enables the corridor to have opening windows to three aspects, so that some can be opened whatever the direction of the wind; it also makes it possible to cut off the bathroom, housemaid's closet, and w.c. by means of a lobby having two little windows on to the court.

Of the treatment of the rooms little need be said. The recesses by the chimney breasts are fitted with cupboards and book shelves, which are designed to include simple framings or mantels for the fireplaces; the cornices are arranged to match the cornice over doors and windows and to carry line with a picture-rail running round the room. Wallpapers or other decorations stop at this rail, all above being taken in with the ceiling. This arrangement enables the ceiling to be broken up with the slopes of the low roofs without giving the ugly odds and ends of papered wall, which really are the only unpleasing feature about a ceiling broken up in that way.

During the whole of the planning the elevations are of course kept in view, and the block design carried away in the mind from the site constantly exerts a modifying influence. The difficulty usually is to maintain sufficient simplicity; so many features are suggested by little conveniences of planning that one has more often to cut them out, not to seek for them merely for the sake of effect.

This plan which we have just considered, representing, perhaps, rather a large house to be classed as "small," does not quite illustrate one point to which we attach very great importance in the designing of small houses. The two plans on page 57 show this—in which a special effort was made to obtain one room (the hall) giving some sense of space in a house not large enough to contain several large rooms. In every small house it should, we think, be a first consideration to secure one room large enough to afford some opportunity for interest being worked into the room itself, and to allow some comfort and dignity in the life of its occupants.

In the house shown the hall was made into the chief living-room and carried up two storeys to permit the introduction of an organ gallery. The gallery leading to the balcony, the landing, and the staircase are all thrown into this hall, the stairs being so arranged as to afford a screen to the fire, forming a sort of deep ingle with low ceiling under the landing. The low ceiling continues under the organ gallery and the balcony, the central part of the hall being open to the full height. The sense of cosiness in this ingle is greatly enhanced by contrast with the lofty open space outside, while the variety in lighting—whether when the morning sun streams in at the great east window, or when the ingle glows red in the gathering dusk—adds a perpetual charm. In the gallery is a second fire with a lounge seat by the organ under a kind of canopy formed by the half-landing of the second-floor stairs.

To obtain this spacious hall the remainder of the house has been reduced as much as possible. Only one other small room, for den or meal-room, is provided, with kitchens, offices and four bedrooms, two of which are on the second floor. It is open to question whether it would not have been a wiser use of the space to have thrown the vestibule also into the hall as was at first intended. Much dignity would have been added to the entrance thereby, while the way from the kitchens to the bedrooms would have been even less through the living parts of the hall than now.

Lest you should be inclined to think that only for people living a very exceptional life would it be advantageous to throw so much space into one room, I will next refer to a design made for a London literary man, who, though not able to afford a large house, still, by reason of his position, required occasionally to be able to entertain a good deal of society. Here the first consideration has been to obtain a hall which would be at once a comfortable living-room and a dignified entertaining room (see page 60). The meal-room has been kept as small as would just allow a little dinner party to be given in it. The fire is placed in one corner, the sideboard in another; had it been possible to put the door also in a corner it would have been still more convenient, for in a small dining-room it is in the corners that there is a little space to spare.

The narrow Hampstead building plot, having a southern aspect and the best prospect to the south-east, dictated the general arrangement of the house and the placing of the best room at the south-east corner. This room is spanned by two arches to carry the wall of the study over; within one of them is placed the fire recess with seats and fitment, thus using up all the space under the stairs to add to the size and character of the room, while the stairs themselves, which are shut off from the vestibule by a door, are also open to the room, the quarter-landing forming a small gallery overlooking it.

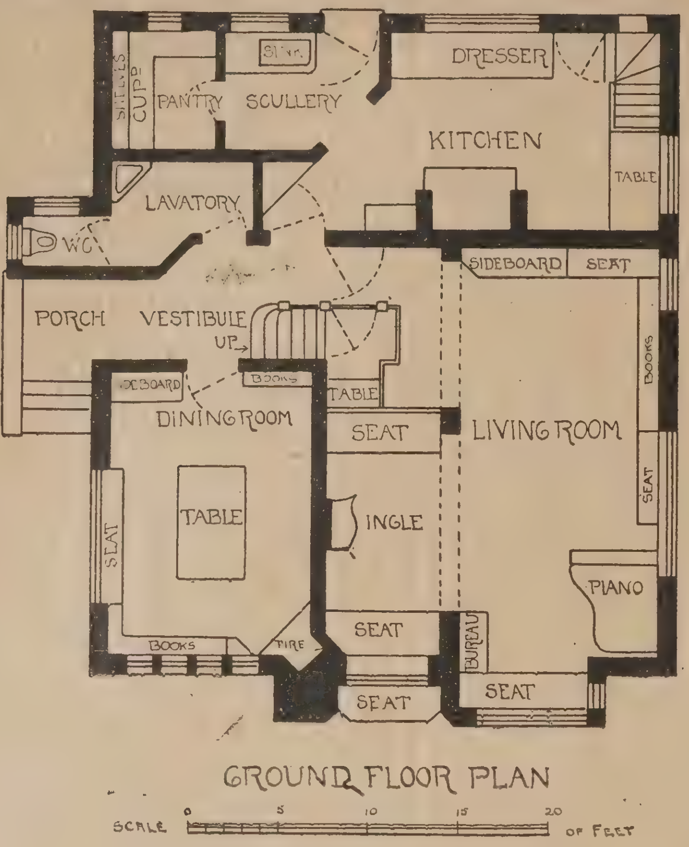
The staircase is such an essentially interesting and decorative feature in a house that it always seems a pity to shut it off in a mere passage, and the space under and around it may be made to add so much to a room both in size and individuality. In old houses the charm of such features is well recognised, for the favourite view, alike for the artist and the photographer, is that which contains some peep of stairs from the hall, some gallery, balcony, ingle or deep window recess. When the most is made of such advantages as can be claimed for the bare square room, they seem but a poor compensation for the loss of character and charm.

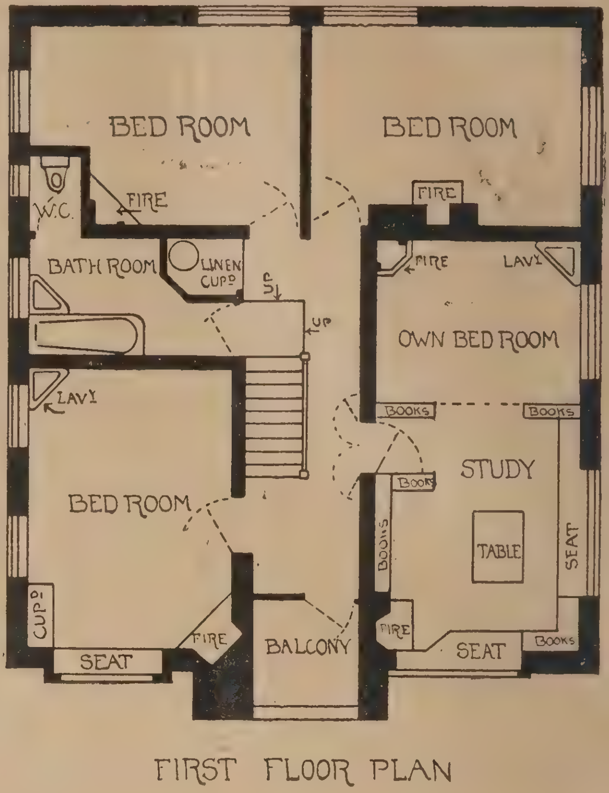
Over the hall in this house are placed the client's study and bedroom, the two being so combined that both may have the benefit of the whole air-space, book-cases and curtains screening off the bedroom portion. Double doors and double windows are fitted to this room, for perfect quiet both by day and by night is essential, and further to secure this, ventilation is obtained by means of two fireplaces and an air shaft built in one of the stacks.

But I must pass on now to cottages, the second part of our subject. I propose to regard as a cottage any house in which separate accommodation is not provided for servants.

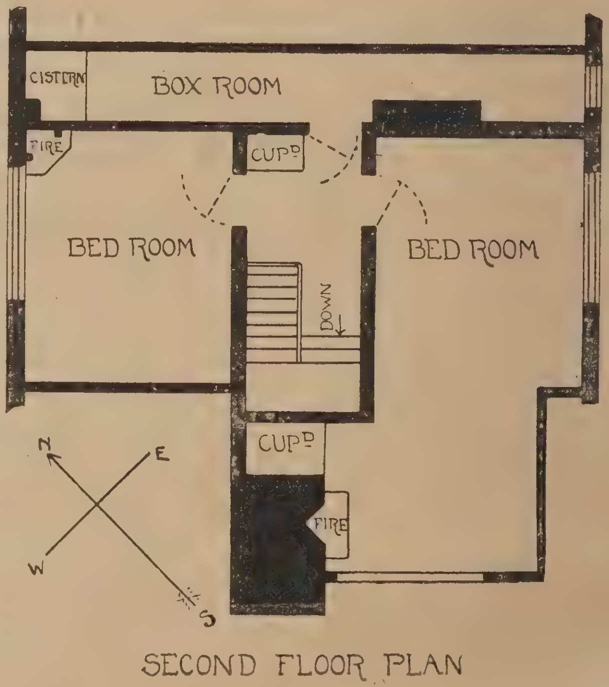
To cottages then all that has been said about the advantage of securing a good living-room, even at great sacrifice of other conveniences, applies with additional force. For not only is the total space at our command usually less, but the number of functions which the living-room has to provide for is greater, many of the functions of a kitchen being added to it. To combine the comfort of a living-room with the convenience for work of a kitchen will tax our skill in planning, and as the space we can give becomes less our care in the disposal of it must become greater.

Let us again proceed by way of example, taking a rather large cottage designed for a client who wished to live a quiet, simple life, yet on a scale that would allow of his enjoying the more necessary comforts and refinements (see this page and the previous one). The site





HOUSE AT HAMPSTEAD FOR A LITERARY MAN.
BARRY PARKER AND RAYMOND UNWIN, ARCHITECTS.



is near a small Derbyshire town, and consists of a mound caused by the outcrop of some shale grit. The site seemed to demand a simple oblong house with plain open roof kept as low as possible, forming a sort of ridge on the steep-sided mound.

The western end of the building naturally becomes the living-room, having plenty of window in the desired direction. There is a window to the north to command the best of the view—not a large one certainly, but one so placed that it is natural to look through it from many parts of the room. A window on the south side admits plenty of sun, and in addition on this side there is the outer door, placed there that it may be possible to enjoy the charm which a door opening direct from a room on to a sunny garden always gives. Such a door must, however, be so placed that while the peep out is obtained the comfort of the room is not destroyed. Here we have gathered the two doors and the stair foot together in a narrow part of the room out of the way, leaving all the rest of the space comfortably to occupy. The fire is placed on the north wall, in a deep recess.

To this one good room is added a kitchen for the more dirty work, fitted with a small range, a good cupboard for coats and hats by the entrance, a coal-place and larder. Upstairs are four bedrooms; one being rather narrow has a bed-recess taken off the larger room to help it, and as it is over the low ceiling of the ingle it gets the advantage of extra height under the sloping roof, and thus the low ceiling, which adds so much to the feeling of cosiness in an ingle, is made to help the bedroom over. Where some such arrangement as this is not possible, we sometimes utilise the space between the low ceiling and the floor above as a storage cupboard, and we often take advantage of it for ventilating purposes, by bringing fresh air into the room, slightly warmed by passing behind the fire, and delivering it over the opening to the recess, where it is distributed with the least possible draught. Where an outlet into a flue is desirable to supplement the exhaust due to the fire, we find this a very good place to arrange it In a room with close-fitting iron casements, sufficiently well built not to leak excessively through floors, skirting and door, the most frequent cause of a smoky chimney is the want of sufficient air-supply, and some form of inlet is an absolute necessity. In bedrooms we have successfully arranged this through a hollow fender kerb in some places.

All the bedrooms in this cottage are so arranged as to have a fairly comfortable corner between the fire and a window, where one can sit to read or write. An east aspect is obtained for the bathroom, and a linen cupboard warmed by the cylinder is provided.

Of the elevations I need only say that local random range stone is used for the ground storey, while for the upper portion the need for obtaining four bedrooms over a house so narrow required the use of 9in. brick walls, which are rough-cast in cement. To avoid the expense of dressed stone, and also to connect the two storeys a little, all the windows have brick jamb and mullions, and the rough-cast is carried down over them. The roof is covered with local stone slate.

Time will not permit me to refer in detail to any smaller cottage plans. But enough has, I hope, been said to make it quite clear that, whatever the size of the house, we think it should grow, both as a utilitarian plan and as an artistic creation, out of the real needs of the occupants; and that the art of designing small houses and cottages consists, not in following any accepted code of conventions, however useful these may be in their place, but in working out such a convenient and comely setting for the special life that shall be lived in them as shall enable that life to expand itself to the fullest extent, not merely unhampered by the building in which it is clothed, but actually stimulated by a congenial surrounding.

Workmen's Housing at Merthyr.—The Merthyr Urban District Council have the sanction of the Local Government Board to borrow £15,000 for the erection of 100 cottages at Penydarren.

Cripplegate Church.—A correspondent writing to the "Morning Post" in support of the proposition that the ancient Church of St. Giles should be opened up to view by leaving some land, now happily available, free from the hands of the builder, points out that the statement in the petition presented to the Court of Common Council that "the church was built as far back as 1090" is incorrect. The existing building was erected at the end of the fourteenth century. In 1545 it was greatly injured by fire, but happily it escaped destruction in the Great Fire. It has been altered and patched up at various times, the last restoration being in 1862, but it still preserves its old form.

ENGLISH ARCHITECTURE OF THE NINETEENTH CENTURY.*

By G. A. T. MIDDLETON, A.R.I.B.A,

IT is only with a considerable sense of the responsibility and the difficulty of my task that I have accepted the invitation of the Council of the Society of Architects to review the "English Architecture of the Nineteenth Century" immediately upon its close. Writing to-day, literally January 1st, in the first year of the twentieth century, it is almost impossible to divest one's self of all bias, and to approach without it the consideration of even one phase of the work of the most humanly complex century which the world has ever seen, especially when the phase in question is that which is the principal concrete reflection of the varying moods of man.

Looking dispassionately and broadly at the century which has recently been completed, it is seen to have opened for England in turmoil, poverty and privation, its people being borne up by a spirit of high patriotism. This period was followed by one of recuperation and then by rapid (at times too rapid) trade advancement, as the power of the steam engine was developed and our coalfields were opened up. Contemporaneously there came over the country a marvellous revival of religious feeling, both in the established and nonconformist churches. Towards the close of the century these fiercely-rapid movements settled down into steady commercial prosperity and generous religious tolerance, with less exuberance but more depth and solidity in both; and there has developed a still steadily advancing tendency to educate the people more and more highly, and to promote healthy municipal and family life, with comforts and elegancies within the reach of all, both in their own homes and in public institutions.

There have, of course, been other influences at work, and occasionally national events, such as the Crimean War, have caused at least a temporary diversion of the trend, but upon the whole these appear to be the lines upon which a general advancement has taken place. They are, too, the lines which are most prominently reflected by the architecture, and for the most part, it must be borne in mind, unconsciously upon the part of the architects who were individually concerned.

Speaking now of the country's architecture, it will be noted that the eighteenth century had seen the gradual decadence of a true English Renaissance style, and the substitution of formality and precise rule for the originality introduced by Wren and maintained by his immediate successors—alike in important buildings and in the comfortable square-brick dwellings of the middle classes. All design was based upon the Roman orders, which had been reduced to a system of precise proportions, on no account to be departed from, and this had become so entirely a fixed principle that even the discovery of the much more beautiful Classic work of Greece, with its varying proportions, had hardly shaken it.

At the commencement of the nineteenth century, consequently, all English architects were by training and education Classic purists, and were divided into two schools—Roman and Grecian—the many followers of Sir William Chambers forming the first, and Inwood leading the second, that is if during the first twenty years of the century England can be said to have possessed any architecture at all, for no buildings of first-rate and very few of even second-rate importance were attempted. Inwood, however, with his exact Grecian copyism, as in the Church of St. Pancras, was destined to be followed by others who, like himself, studied Grecian architecture in Greece, and who, on their return home, erected dignified and well-proportioned buildings in the Grecian spirit—not many, but now and again one, preserving in this country for more than half the century an appreciation of the simple, the beautiful and the refined, which might well otherwise have been lost. Such buildings were the British Museum, by Sir Robert Smirke; the Liverpool Athenæum, by Thomas Harrison; the Hanover Chapel in Regent Street, by C. R. Cockerell; and St. George's Hall at Liverpool, by H. L. Elmes—this last being one of the really great buildings of the century, perfect in its proportions and in the delicacy of its details, magnificent in its scale and perfectly satisfying to the most cultured taste.

But if the Grecian school retained for England an appreciation of the choice and pure, the Roman school, capable of wider and more varied interpretation, was eventually to have the greater influence, merging as it insensibly did into a revival of pure Italian Renaissance. In this form it was responsible for the Travellers' and the Reform Clubs, by Sir Charles Barry; the Carlton Club, by Sir Robert Smirke; the Museum of Practical Geology and the west end of Somerset House, by Sir James Pennethorne; and St. Thomas's Hospital, by Henry Currey—all works of great importance and worthy of any architectural period in any country. These it will be noted are all metropolitan buildings, and except in London and a few of the larger provincial cities scarcely any examples of the style of any value are to be found. About thirty years ago, indeed, it had to fight for its very existence in the now almost forgotten but then extremely virulent "Battle of the Styles," and its exponents, then mostly old men, were apparently vanquished by the more enthusiastic and younger votaries of Gothic work.

The Gothic Revival had commenced much earlier, and at that time seemed likely to become a permanent English style. Yet, like a hot-house plant, it withered with extreme rapidity after displaying a few flowers of great beauty; and it exists no longer. Originating out of the attention drawn to our churches by the "Oxford Movement," and from the necessity of repairing and enlarging the churches and cathedrals in architectural harmony with their original design, an immense impetus to the general employment of Gothic forms was given by their adoption in the Houses of Parliament by Sir Charles Barry, who had invaluable assistance from Pugin in the preparation of the designs. This truly magnificent building, a veritable "Wonder of the World," owes its greatness to other qualities much more than to that of style—to its marvellous grouping, its absolute suitability and great originality. Its style, in fact, is mixed, the general lines of the river front being essentially those of a Renaissance building; and even the Gothic detail is not above reproach if examined separately and considered as Gothic detail only, and not, as it should be, as the suitable and harmonious enrichment of one of the grandest buildings which the world possesses.

The influence was first felt by directing the attention of the students of the day to the possibilities of Gothic architecture, and attained fruition when these students reached their practising manhood. Butterfield, Sir Gilbert Scott, Paley, Street, Burges, E. M. Barry, Pearson, Sir Arthur Blomfield and Bodley are a few of the names most closely connected with the Gothic Revival; but Pugin had preceded them all, and is now generally regarded as the "father" of the style. The "cross" in the courtyard of Charing Cross railway station may, though small, be taken as a typical example of his work, and in this regard well bears comparison with the larger but somewhat similar Albert Memorial by Sir Gilbert Scott.

It is, however, somewhat invidious to single out any one of Sir Gilbert's Gothic works for mention more than the others, for if Pugin was the "father" of the revival, Scott was certainly its most prominent exponent, there being scarcely an English cathedral which he did not touch by way of restoration or some small addition, and hardly an ecclesiastical edifice in the country about which he was not in some way or other consulted. Of his original churches, the best known is St. Mary Abbott's, at Kensington, but merely from the accident of its being in the metropolis; for many are as rich and as perfectly proportioned, and, it may be added, as mechanically exact in detail.

Irrespective of restorations, the other great ecclesiastical works of the period may be reduced to four; and though there are a really large number which are eminently satisfactory, these four stand out unrivalled, while each is very different from all the others. Christ Church, Westminster Bridge Road, the work of Alfred Bickerdike, who died recently in obscurity, is an example of perfect grouping and graceful detail, worthy of the best mediæval period; Cork Cathedral is instinct with the spirit of original conception and overflowing artistic inspiration of William Burges; Truro Cathedral is the refined result of careful study of English architecture of the thirteenth century, by J. L. Pearson; and Trinity Church, Chelsea, exhibits the strong individuality of J. D. Sedding, tempered by much sketching both at home and abroad.

The public buildings erected during and in accordance with the Gothic Revival were scarcely so numerous, and show by their general unsuitability that the style was a forced revival and not a true growth. Thus it is that, in spite of their great beauty, the word "unsuitable" has been used as sufficient to condemn alike the Manchester Town Hall, by Alfred Waterhouse, and the Law Courts, by G. E. Street—though in the public mind the great architectural merits of this latter work have been greatly obscured by its acknowledged defects in plan, while among English architects the fact that it follows French rather than English tradition has frequently led to its being only half understood. Both, however, are great buildings, and speak eloquently of an endeavour amongst the more cultured of our race to express their desire to have things graceful and beautiful around them. More generally acknowledged as a successful Gothic public building is St. Pancras Station, by Sir Gilbert Scott, with its somewhat formal lines well concealed by clever grouping and the use of graceful towers, and its special adaptability to modern requirements. So far as it is formal and suitable to a modern many-storeyed building, it has been followed in many a smaller building since, but in its higher attributes it stands alone. For private houses the "Revival" has proved a failure, as it did for street architecture also, a notable exception being Mr. Astor's offices on the Thames Embankment, designed by Mr. Pearson.

The Natural History Museum was erected by Alfred Waterhouse, about twenty years ago, in what seemed then to be the full height of the Gothic Revival; and yet marked its coming sudden termination by the evident attempt, in a building of the first importance, to evolve something fresh. In spite of the deserved popularity of its author, the first of the great Gothic revivalists to willingly break away from the employment of Gothic forms alone, and almost the only one of those great men still living amongst us, this, his greatest work, has hardly received the recognition from his contemporaries which it deserves, and which will undoubtedly be bestowed upon it by posterity. Not many English buildings display so perfectly the quality of thoughtfulness based upon ample consideration of what is best in many other countries besides our own, combined with extremely careful colouring.

With the death of Sir Gilbert Scott in 1879, followed by the decease of Street and Burges in 1881, came the end of the energetic phase of the Gothic Revival. During the whole strenuous period it had unconsciously been but preparing the ground for something else, while the Classic and Renaissance traditions which it had apparently overwhelmed had in reality been but slumbering, and now awoke with the contemporaneous erection of the Bolton Town Hall, by W. Hill; the Glasgow Municipal Offices, by William Young; and the Brompton Oratory, by Herbert Gribble. The first of these was, at its opening, commented upon by the "Times" as "an edifice which, for architectural beauty and internal arrangement and decoration, is probably unrivalled by any building in the country which is devoted to municipal purposes"—an opinion which at any rate received endorsement in the erection of replicas at Leeds and Portsmouth. Of the Oratory it need only be said that it is incomparably the finest Renaissance church erected in England since the days of Wren.

The next architectural phase was a curious one—a rage for the quaint, induced by an over-study of the buildings in the low countries and the district of the Loire, in the hope of developing a picturesque style of small dwelling, and contemporaneous with the "æsthetic" craze in art generally. It would occupy too much time to-night to consider any except works of some magnitude, else a good deal might be said of the highly satisfactory domestic architecture of the last twenty years under the leadership of Norman Shaw and Ernest George. But the influence of this domestic style was felt in larger buildings, the picturesque grouping and tiny detail suiting well the comparatively small Law Courts at Birmingham, by Aston Webb; the recently-erected Municipal Buildings at Oxford, by H. T. Hare; and the English Opera House (now the Palace Theatre), by T. E. Collcutt; while it went far to detract from the nobility of the Imperial Institute.

---

* A paper read before the Society of Architects on February 21st, 1901.

This tendency to littleness of detail was checked by the common-sense solidity of Norman Shaw's New Scotland Yard, still in a distinctly Belgian style (its evident prototype being the Mont de Piété at Liège), and by the reversion to a strong Italian Renaissance in the Accountants' Institute, by John Belcher. This last is the most notable building completed during the last decade in England or elsewhere, its fine proportions, its strength and its bold originality, combined with the free use of the highest class of sculpture, raising it far above contemporary works. Its influence, too, appears likely to be considerable, if one may judge from the published designs for buildings which are not yet erected.

Looking back over the century as a whole, one cannot help being struck both by the immense variety of first-rate building which has been done in England, and more by the steadily increasing amount of good work which each decade has seen. During the early decades a few great buildings arose in London, but generally speaking architecture was a lost art; now there are educated practitioners in every part of the country, who are producing artistically satisfactory work largely in accordance with a prevailing fashion or style, while buildings of importance, hospitals, schools, town halls, &c., are rising everywhere. The past has shown progress, and the prospect for the future is good.

A GREAT HOUSING SCHEME.

BY far the largest housing scheme undertaken by any municipality is now proposed by the Housing Committee of the London County Council. An area of 225 acres of land has been secured at Lordship Lane, Tottenham, outside the county boundary, and it is proposed to erect there sufficient semi-detached cottages (with gardens) to accommodate 40,000 persons. The land upon which the new cottages are to be built lies high, and is well situated so far as communication is concerned. On the northern part of the estate there will be four classes of cottages. The fourth class will consist of dwellings which will hold 3,360 persons in 336 flats, built two in each house. The third-class cottages will number 1,900, for 11,400 persons; the second 1,950, for 11,988 persons; and the first 346, for 2,976 persons. The southern portion of the estate will accommodate 7,460 persons in 1,029 cottages. The cost of the scheme will be about £1,500,000. A portion of the land in the centre will not be built over, but will be left for a recreation ground, with public hall and offices, for the new scheme means the erection of practically a new and self-contained town. Shops, also, will be built on the estate, and will be an important source of revenue. Of the land to be taken, 177 acres are ready for building, and the work can be put in hand at once. The other portion requires a certain amount of clearing. Even with the restrictions now placed upon the Council by the Local Government Board as to the repayment of the whole outlay and interest within sixty years, it is anticipated that the work can be carried out without imposing any burden on the ratepayers, at the same time erecting dwellings which can be let at rents which, it is expected, will range from 6s. to 9s. 6d. a week.

Besides this scheme, the Council has two others on a similar plan in hand for the benefit of South London—one at Norbury, which will accommodate 5,800 persons, and one at Tooting for 8,500. Already 12,000 people live in County Council dwellings. By the time that the Norbury, Tooting and Tottenham schemes have been carried out there will be nearly 100,000 persons so housed.

Builders' Notes.

Mr. Edward Benson, decorator, of Darlington Street, Wigan, died recently.

Messrs. Young and Marten, Limited, of Caledonian Works, Stratford, have just issued a new list of trade discounts allowed on the prices in their well-known and comprehensive catalogue.

Mr. John Rothwell died recently at the age of 74. Deceased was senior partner of the firm of Messrs. Rothwell and Sons, builders, St. Helens. He leaves a widow, two sons, who carry on the business, and two daughters.

Messrs. Greaves, Bull and Lakin, blue lias lime and Portland, selenitic, Roman, &c., cement manufacturers, of Warwick, are converting their business into a limited liability company, under the title of "Greaves, Bull and Lakin, Limited." This change is made simply for family convenience, and the entire ownership, control, and management will remain in the present hands. The head office has been removed from Warwick to their Harbury Works where the postal address will be "Harbury, Leamington." The branch offices in London and Birmingham will remain as at present.

Mr. Benjamin Holland, a well known Dudley builder, died recently at the age of 62 years. The business of builder and contractor which the deceased gentleman had for many years carried on with his surviving brother, Mr. William Holland, was commenced by his grandfather, Mr. John Holland, in High Street, Dudley, in 1790. After the death of this gentleman the business was carried on by his son John in Wolverhampton Street, Dudley. Afterwards the business was continued by Mr. William Holland, father of the deceased gentleman, and eventually the deceased's brother, William, and himself in partnership, under the firm of "William Holland and Sons." Church work figured largely in their contracts. Amongst others may be mentioned: the restoration of St. Mary's, Kingswinford; St. Edmund's, St. Thomas's, St. James's, and St. John's, Dudley; Christ Church, West Bromwich; Cradley (Four Ways); Gornal Church; and Enville Church, which occupied five years. Schools and other buildings also formed a large part, including Wolverhampton Street Board Schools, alterations to Kate's Hill Church schools, Dudley Baths, &c.

The Nottingham Master Builders' Association held its annual dinner last week. Mr. H. Vickers presided, with Mr. F. H. Fish as vice-chairman. Mr. Price proposed "The Mayor and Corporation of Nottingham," coupling the toast with the names of the Sheriff, Dr. J. Brown Sim and Councillor J. Wright, who responded. "Success to the Nottingham Builders' Association" was proposed by Mr. J. W. Woodsend and acknowledged by Mr. F. H. Fish. Mr. James Wright gave the "National Federation and Kindred Associations." He urged the association to continue connection with the National Federation, the Midland Branch of which was an attempt to unite and weld into one body all the master builders' associations of the Midland counties. Their relationship with the architects was fairly, though not wholly, satisfactory, neither with regard to Nottingham or any other towns he had visited. The National Federation had had in hand for many years, with the Royal Institute of British Architects, the drawing up and forming of a national and recognised form of contract which, when it was complete, would be satisfactory to all parties. During the past year this had been under discussion by the Midland Federation, and a form of estimate had also been under consideration. Mr. A. Chambers and Mr. J. B. Alliott responded.

The Clerk of Works Association.—The 18th annual dinner of this Association was held last week at the Holborn Restaurant. Mr. W. E. Riley, F.R.I.B.A., the superintendent architect of the London County Council, presided. Mr. Spencer Green, vice-president, in proposing the toast of "The Architects and Surveyors," said he was glad to be able to say that one effect of the formation of an association was that the salaries of clerks of works had considerably increased of late years. Mr. Thomas Blashill, F.R.I.B.A., who replied for the architects, said that all practising architects knew how to value the meritorious service of the clerks of works. It would be impossible to carry out works of the magnitude with which they now had to deal unless the clerks of works were of the greatest efficiency. The materials now being used in connection with fireproof construction called for their special attention. Before long he hoped that it would be a rarity to see buildings of any importance whatever that were not properly constructed, and that would not absolutely resist a fire. With the good assistance of the engineers in scientific matters they would be able to effect a great improvement in that which was a very important branch of their business. Mr. Chatfield Clarke, F.R.I.B.A., replied on behalf of the surveyors. Mr. Spooner gave the toast of "The Carpenters' Company," and said that that guild had done everything in its power to raise the status of their association. Professor T. Roger Smith, F.R.I.B.A., master of the Carpenters' Company, responded. The chairman, in giving the toast of the evening, "The Clerk of Works Association," said they had made great strides since the time when Sir Christopher Wren was his own clerk of works in connection with the erection of St. Paul's Cathedral. The duties of the members of the association were much more onerous than many people realised, but the architects knew how much they were indebted to them. When he was in his pupilage if he wanted any information about sound and practical building he was always sent to the clerk of the works, from whom he invariably received an intelligent answer. The President, Mr. Plowman, in replying, said that the association now had 150 members. They were progressing from year to year, and they hoped before long to secure the co-operation of the Royal Institute of British Architects and the Institute of Civil Engineers in raising their status. Many members of the association were in favour of incorporation, and he hoped it would soon come about.

Correspondence.

Old Lancashire Churches.

To the Editor of THE BUILDERS' JOURNAL

MANCHESTER.

SIR,—"Southport" will find Baines' "Lancashire" of use in connection with old Lancashire churches. Ormrod's "Cheshire" and Dugdale's "Derbyshire" may also be of service for these two counties.

Yours truly,

W. K. BOOTH.

Lightning Conductors.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—Referring to Mr. Hands' very interesting letter on page 25 of your issue for February 13th, with a further criticism of my article on lightning conductors, it is true lightning does not exactly "wander aimlessly about," but it certainly has the peculiarity of being so erratic in its course as to leave an unpleasant element of chance as to how the electric—force, shall I say (I must not call it "fluid")—will distribute itself.

In general Mr. Hands disagrees with me in what I said about leaving these matters to so-called experts. Can he say whether an expert advised the builders of the great cathedral spires of Salisbury, Lichfield, Chichester (prior to the restoration in 1861) and others? These have safely weathered many a storm.

Yours truly,

CHARLES E. SAVERY.

R. I. B. A.

PRESIDENT'S ADDRESS TO STUDENTS.

A MEETING of the Royal Institute of British Architects was held last Monday evening. Mr. William Emerson, president, was in the chair. The minutes of the previous meeting having been confirmed, Mr. Emerson's address to students was read by the Secretary, Mr. W. J. Locke; the following is a summary of it:—

In the few words I have to address to the younger members of the profession I will endeavour to lead you to some higher planes of thought in relation to the practice of the art of architecture, rather than to mere practical business elements material to success. I presume, of course, that those of you who have taken the trouble to pass our examinations have in your minds the idea of actually practising in the profession. I will therefore consider some few of the things involved in this word practice, the objects, aims and points in connection therewith, that should be weighed by one undertaking such responsibilities. There is a right use or proper employment of architecture. I need hardly point out that building is the most necessary of all sciences: in its objects it subserves the highest and the lowliest wants of humanity. It is a science, but the love of beauty inherent in our natures makes us demand that it be more—that it be an art as well—and this side of it is architecture, and, if good, unites with it all arts.

I pointed out last year how a thorough education, not only in architecture itself, but on a wide and comprehensive basis, is essential; and this education should not only be gained by study of man's work in the arts and sciences, but also by study of God's work in nature. There should be besides an inquisitive, diligent searching into the reasons of things. Architecture should be more than mere building in the best material and manner; the thought and needs of the time must be expressed. It does not suffice to satisfy the one only who has conceived it, but it should be capable of pleasing all people in all times. It is the divine element in man materialised in his works: his two natures, the human and the spiritual, are evidenced in his individual conceptions. In real architecture there must be not merely the individual bias or personality exhibited by one's particular devices, peculiarities, or the excellences of one's draughtsmanship, but there must be the expression in all sincerity of spiritual sentiment also. The artist's material personality or mechanical dexterity should not be predominant so much as the spiritual or divine influence inspiring him. If such be our aim, we shall rightly use any powers of architectural design with which we may be endowed, and be enabled to express the highest mind that is in us by the forms of which draughtsmanship will convey the conventional rendering. This habit of mind, combined with constant practice, care and accuracy, will lead to dexterity of expression of feeling which is essential. But more than habit of mind for fitting expression in our art is necessary for successful practice. There should be habit of method in study, and attention to apparently trifling details, and in business conduct. There is nothing so prejudicial to artistic effort as worry. Therefore the architect whose soul is in his art should strive by methodical habits and rules of business to render himself as impervious as possible to worry.

The importance in practice of study with thoroughness in both the theoretical and practical sides cannot be too strongly urged. If it be true that in trade a highly trained intellect is so essential, in how much greater degree must it be so for the profession of architecture! For beyond the mere business element, without which, to a certain extent, it is impossible for the architect to practise successfully, there is the necessity for a thorough knowledge of art, with much of many other subjects, such as science, history, &c., combined with the study necessary for the acquirement of that dexterity without which he cannot express his ideas. A serious reflection for the young student in this country is how very much his education must depend upon himself and his own exertions if his work is to be more than that of an amateur and have vital force, and if he wishes to succeed by his power and competency rather than by smartness and push, or playing off upon the public the eccentricities or fashions of the moment. The days of mere building by architects in this country are, we hope, fast passing away; and this century the public will demand, not only that the architect be versed in all practical details of his calling, but that, by really cultivated taste and intellect, he may build with power, beauty and perfect utilitarianism.

But by those who wish to excel as artists time must be allowed for the study of nature. Deductions and inspirations innumerable may thus be gathered, with a freshness no study at second hand from man's work can give.

Higher education is absolutely necessary if the status of the architect is to be raised. It should be remembered that doctors and barristers are almost always University men; and it will be well to bear in mind that the sooner it becomes the rule, rather than the exception, for architects to receive a higher, or perhaps a University education, the sooner will the acknowledged status of the profession be elevated.

Then for facility of practice the architect should cultivate his memory; and as all cannot perform feats of memory, a practice of writing down useful information should form another habit. The architect in designing not only requires to remember details of old and other work as a guide, incentive, or restraint to his own, but he must recollect endless details of construction. But above all he must remember the effect certain proportions, details and compositions have given, in isolation or when in juxtaposition in former examples, ancient or modern. An educated perceptive faculty and a good memory are necessary to realise the full teaching of past times.

There is also in connection with the practice of the art of architecture such a word as proportion; and its value and meaning may easily be lost sight of. To the architect's mind may probably immediately be suggested the comparative relation of one architectural detail to another and to the whole composition. But besides the objective symmetry and harmonic degree of form or size, proportion may be considered by the architect in other ways. Of course, proportion in this sense is the very first essential of fine architecture. It should be an inherent faculty in the architect and artist, but it may be cultivated. And proportion must descend also to the smallest details. Proportion in colour is also a most important factor in the excellence of artistic work. The study of nature is the guide as to how much of any one colour will harmonise with another.

There is also a proportion in architectural work which requires to be maintained between coarseness and refinement. This is a very subtle point in all good work. Too much refinement in architectural work tends to weakness of effect and deprives it of its masculinity. At the other extreme, "muscular" architecture, as it has been termed, may degenerate into coarseness. It is the carefully balanced proportion between these that avoids either extreme. The effect of all the finest architecture has been attained by a combination of strength and power with refinement of well-proportioned and beautiful detail. Too much care cannot be bestowed on the proportion that sculptured and other decorations bear, first to the whole composition, and secondly to each other. In all this the architect's should be the guiding spirit, however much may be done by the craftsman or sculptor.

Then there is the proportion that the worship of one's art should bear to one's life. The larger the environment the greater the sphere of usefulness in life.

Success in the practice of an architect, as in other callings, should be aided by a proportionate feeling sympathetic with a life full of effort and enthusiasm. Nevertheless, success in the art of architecture should be the settled purpose of him who proposes to practise, and that to the fullest extent, "in proportion to his being a human being, living his life amongst his fellow-creatures, to whom he can impart or derive something. The aim of culture is to make us better company as men and women in the world." There is also a proportion that should be observed between the ideal and the sentimental. The one is the spiritual in our art, the other the simply sensuous.

Æstheticism, an American writer says, is not "the vital force inherent in the idealist; much of what in our architectural art of to-day seems to satisfy the casual and thoughtless is devoid of the life and spirit of art. It is the idealist who will, with a strong faith in the spirit that is in him and with energy of purpose, strike out for himself fresh achievements. He may fail, but he is ready to take the risk, and has the courage of his opinions. To the æsthete a lower plane of work altogether, a pretty tone of colour or eccentric form, a delicate curve or a sentimental line of poetry, devoid of the spiritual essence of the ideal but pleasing to the fancy, will afford infinite satisfaction" So there should be proper proportion maintained between artistic sentiment and practical purpose. The man who sacrifices the purpose to the art is not a useful member of the community; while he who sacrifices his art altogether to utility does not elevate the community. It is the correct judgment weighing the proportionate values of the one and the other which makes the architect.

Then there is the necessity for a proper proportion being maintained between work and rest. There is such a thing as staleness. The want of recreation makes a man dull, unfit for companionship or sympathetic mingling with or interest in his fellows; and his work suffers in consequence. Also there must be margin for reflection and thought. Great achievements usually germinate in quiet moments.

Then of much importance in connection with the practice of the architect, as in all other businesses in life, there is another thing that must be borne in mind, and that is right principle. This in architecture will mean an avoidance of shams and false construction, which somehow always manage to look wrong, even though worked on such a grand scale as the external walls of St. Paul's, or the impudent ugliness of our shops with stone façades, apparently standing on nothing. Truth makes work look consistent and correct; lack of it offends good taste. Palatial decorations in offices, ecclesiastical embellishments in restaurants, the affectation of cottage simplicity in a palace, or *vice versâ*, imply a want of appreciation of the fitness of things, and are wrong in principle; and this element of truthful principle in architectural art should be carried down to the smallest detail if the work is to live.

Then there should be right principle in your motive of action; and this is a most important point if you desire not only your personal position to be respected by others but also wish to uphold the dignity and status of your profession generally. Professional respect must ever depend on the character, conduct and aims of the units in the profession. The architect should, on principle, enrich his mind and render himself proficient in all branches of his work, as his duty to his clients, and should deal fairly and avoid harshness in dealing with those over whom he is set as a supervisor. You cannot interest yourselves too much in the work of this Institute, whose objects are to encourage the art of architecture, to uphold the interests of the profession, and improve its status. This obligation will be best served by a large-minded way of looking at all sides of thought, and by cultivating broadness of views in our art of architecture, and not by the pushing forward of any particular school or clique. In combination we are strong; separated we are comparatively weak.

Mr. J. Alfred Gotch then gave a criticism of the designs and drawings submitted for the prizes and studentships, 1900-1. Mr. Gotch impressed upon his hearers the importance of the competition for essays, for taking architects as a whole he was sorry to say they were extremely wanting in facility of expressing themselves. The essays should contain only matters pertinent to the subject and have life and be readable.

The prizes were then presented to the winners in the competitions.

Bricks and Mortar.

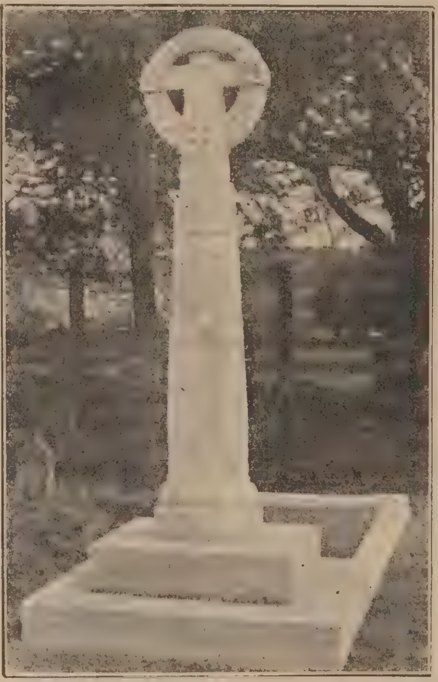
APHORISM FOR THE WEEK.

Fame is the nurse of the Arts.—CICERO.

Our Plates. THE house at Long Ditton for Mrs. Styles is now in course of erection. Mr. A. J. Hardwick, of Kingston-on-Thames, is the architect. The red brick plinth continues around the whole building at the ground-floor sill level, all the upper part (including the chimney stacks, which are built battering) being covered with white rough-cast. The roof will be covered with deep-red Broseley tiles and the external woodwork painted white, with the exception of the porch, which will be left rough from the saw and stained down to a rich brown. The builders are Messrs. M. Kelsey and Sons, Chessington, Surrey. Mr. Hardwick is also the architect of the proposed house on the Thames Ditton Park Estate. This design is intended to be carried out in white rough-cast, the roof covered with Leatherhead tiles, the eaves gutters supported on wrought-iron brackets, and all the external woodwork painted black. A feature is made of the hall, which it is proposed to pave with stone slabs. The constructional woodwork in the ceiling would be left showing and rough from the saw, with rough-cast panels between the joists. The walls will be panelled and the whole of the woodwork stained down to a dark colour. Mr. E. S. Prior's drawing of new medical schools at Cambridge was exhibited at last year's Academy.

Further Discoveries in the Forum. IN the course of the excavations now proceeding between the Arch of Tiberius (see page 44 of last week's issue) and the Basilica Julia, in the Forum, an important fragment of the Forma Urbis, or marble map of Rome, has been discovered. The fragment was found in a sewer, of which it had formed part of the covering. On it are engraved in Roman letters the words ERMAE PAE, which are thus reconstructed (TH)ERMAE (AGRIP)PAE, or baths of Agrippa. The fragment also bears an inscribed plan of a great part of the baths of Agrippa, including the whole of the Pantheon. This is the most important fragment that has been brought to light since the discovery of that which bore the plan of the Porticus Liviae in 1869. In view of the importance of the frescoes discovered in the Palatine Basilica, better known as Santa Maria Antiqua, a commission of experts was appointed to study the best means of preserving the frescoes from destruction. After much discussion the commission has adopted the proposals of Signor Boni, director of the excavations, who is authorised to roof in the Basilica so as to preserve the paintings from the weather; to complete the winding pathway of Imperial construction which led from the Forum to the Palatine Hill; to arrange in the best way possible the flooring of those parts of the Basilica where the ancient pavement has been removed; to disinfect the surface of the frescoes which have been impregnated with deleterious matter during their long burial; and to suggest some means for preserving the paintings from the effects of fog, damp and excess of light. Several of the experts were at first in favour of detaching the frescoes from the walls and placing them in a museum, but after examining the Basilica with care they have decided that it would be far better to leave them where they are.

Mr. Alfred Gilbert on Sculpture. LAST week at Burlington House Mr. Alfred Gilbert, R.A., the newly-elected Professor of Sculpture at the Royal Academy, delivered the first of a series of six lectures on the sculptors of the fourteenth, fifteenth and sixteenth centuries, taking as types Donatello, Michael Angelo and Benvenuto Cellini. His first address was in the main introductory and in a measure historical. For Donatello, Michael Angelo and Cellini he found prototypes in Greece in Praxiteles, Phidias and Zeuxis; though he did not imagine that the Italian artists had any knowledge of their Greek forerunners. Mr. Gilbert drew several comparisons between the two sets of artists, and likened the nature of Donatello, the harbinger of the Renaissance, to that of Praxiteles. Both, as far as he could judge, were men of earnest kindly disposition. Sculpture, which was the most conservative of the arts, exacted more from its followers than either painting or architecture. It demanded more sacrifices because fewer people understood it, and because of another great stumbling block—the question of remuneration. "Sculpture," declared Mr. Gilbert, "is not, and never will be, remunerative." In his next address, among other things, he will explain the process used by the great men mentioned in place of enamelling and the methods of sculpture practised by Michael Angelo. People were under the impression that England had no artists at the time these men were working in Italy. That was quite a mistake, for there were two great English sculptors at the time Torrigiano was carving the tomb of Henry the Seventh. They were not recognised because they were called "effigy-makers." But at Warwick there was a monument executed by one of them, William Austin, in memory of Beauchamp, Earl of Warwick, which was of stupendous excellence, and could, perhaps, vie with any Italian example.



MEMORIAL CROSS, HUNSTANTON CHURCHYARD. H. WILSON, DESIGNER AND SCULPTOR.

Asiatic Art. AT the last meeting of the Society for the Encouragement of the Fine Arts, Mr. Joseph Offord, M.S.B.A., delivered a lecture on "Some New Relics of Ancient Art from Western Asia," lantern slide illustrations being shown of a number of antiquities lately discovered. Commencing with some extremely archaic Babylonian bronzes and reliefs, an Akkadian cylinder of great antiquity was exhibited, having most interesting affinities with the early first or second dynasty Egyptian art workmanship from Hieraconopolis. An exterior restoration of the Palace of Sargon was shown and a description given from the latest researches of the architectural features of Assyrian buildings; also a picture of a striking relief executed in enamelled brick, showing a Gryphon of exquisite design, which was found in the palace at Susa. A series of copies of the bronze reliefs from Balawat proved the perfection attained by the workers in metal as early as the time of Shalmaneser the Third. Two new Hittite monuments of much interest—one a cylinder in the Boston Museum of Fine Arts, and the other a relief of a deity—were followed by a bas-relief from Arslan Tepe in Asia Minor, now in the Museum at Constantinople, which shows a procession of warriors and charioteers of every Assyrian type of art, but probably the product of Vanuic or Aramaic workmanship. Of similar territorial origin was the celebrated Nerab Stele with an Aramaic inscription of as high antiquity as the "Moabite Stone." Among other photographs exhibited was the sarcophagus of Tabnith, King of Sidon, also the splendid tomb of later date, but from the same site, known as the sarcophagus of Alexander, one of the most perfectly preserved monuments of Greek art.

Planning and Design of Churches. AT a meeting of the Leeds and Yorkshire Architectural Society held last week a paper was read by Mr. H. C. Corlette on the "Planning and Design of Churches." In the first place, he pointed out with some emphasis the necessity of the building being made to belong to and to harmonise with its surroundings, and he proceeded to advise architects not to put too much egotism into their compositions. Let the personal element be found rather in their work than in an ostentation, amounting to vulgar display, which forced its recognition upon the notice of all who looked at the building. Proceeding, he offered some advice with regard to the selection of sites and the adaptation of the buildings to their surroundings; and he went on to deal with the technical features of plans, such as those relating to the construction of the sanctuary, the choir, the nave, the side-chapel and the vestries. The lecture was rendered the more interesting and instructive by means of a number of plans and coloured drawings which were exhibited.

Mr. Tweed's Memorial. MR JOHN TWEED, of Chelsea, has nearly completed the last of the four panels which are to constitute the memorial which Mr. Cecil Rhodes proposes to erect in South Africa to the men of Major Wilson's patrol who were slain at the Shangani River just seven years ago. All the figures, both of horses and men, are life-size, those on the fourth and final panel being Captain Judd and Lt. Hofmeyr (on horseback), and Messrs. Vogel (a son of the late Sir Julius), Hellett, Meiklejohn, Welby, Watson and Abbot. The panels, which are cast in bronze, will be all fixed to the sides of a huge monolith close to the famous Zimbabye ruins, and the only inscription will be: "To Brave Men," these being the words originally carved upon a tree near the spot where the bodies of these heroes were discovered.

Electric Advertising Signs. ON page 46 of our issue for last week we gave a report of the case of *Hull* v. *the London County Council*, concerning electric advertising signs. The Electric Sign Company, Limited, now wish to point out that the case covered a very much wider ground than the signs in question, "and, as a matter of fact, the decision of Justices Bruce and Phillimore has defeated the London County Council in an attempt to obtain control, under a section of the London Building Act relating to the 'construction of buildings,' of any and every erection or object affixed to the face of a building and extending beyond the general line of such building. Had this attempt been successful, except in a very few cases where the building happens to be set back from the general building line, every letter, signboard, or other object exhibited on the face of every place of business in London would have been at the mercy of the London County Council."

Memorial Cross, Hunstanton Churchyard. THE cross illustrated on this page was erected under the superintendence of Mr. Herbert Ibberson, F.R.I.B.A., to the memory of the late Francis Hewitt, of Leicester and Hunstanton. It is of unpolished Irish limestone and in one block above the base. The designer and sculptor was Mr. H. Wilson, of 17 Vicarage Gate, Kensington. Our illustration is from a photograph by Miss G. Hewitt.

THE PLANNING OF INEBRIATE REFORMATORIES.—III.

By GEORGE H. BIBBY.

(*Concluded from page* 29, No. CCCXIV.)

IN a previous article I directed attention to the isolation rooms required for violent or disorderly patients as shown in the plan issued by the Home Office. These apartments are planned to be very small, and I have ascertained that there is (possibly as a result of the putting forward of this plan) an impression in certain quarters that a very small cell would be sufficient; this is quite a mistake, but the plan now given indicates a room 13ft. by 7ft. by 9ft. in height, which would afford sufficient space.

I have heard it suggested that the isolation room, or cell, need not be more than 6ft. by 6ft. for inebriates; but it should be remembered that while an English prisoner has a cell with a capacity of 819 cubic ft., a vagrant or tramp confined in a workhouse cell is frequently only allowed a cubic space of 360ft.; the size of his cell being about 9ft. by 4ft. by 10ft., with an area of 36ft. These figures show that the minimum accommodation for vagrants in workhouses compares very unfavourably with that provided in modern English prisons, and that the latter also contain cells which have one-third more area than the lunatic asylum allowance for rooms for single patients. Surely inebriate patients should have not *less* cubic space and floor area than is allowed for ordinary convicts!

The isolation rooms for inebriates may or may not be fitted with a water-closet; but in the first case the cubic space should be 819ft., while, if there be no closet, a cubic space of 600ft. would be sufficient. It will be observed that under all circumstances the prison authorities are more liberal in their allowance of space than the Local Government Board.

Should it be deemed desirable that the isolation rooms should not contain water-closets, these should, instead, be provided near the passage or corridor leading to the isolated rooms, and in or near this corridor may be placed a lavatory with hot and cold water services; but it may be preferred that basins and water be supplied to the inebriate patients in their cells.

In Fig. 1 is shown a plan for isolation cells and corridor; in this instance the water-closets are placed in the rooms. It will be observed that for the purpose of deadening sound the division walls are of a substantial thickness, but other means for securing this object and also the safe custody of the inebriates may be adopted.

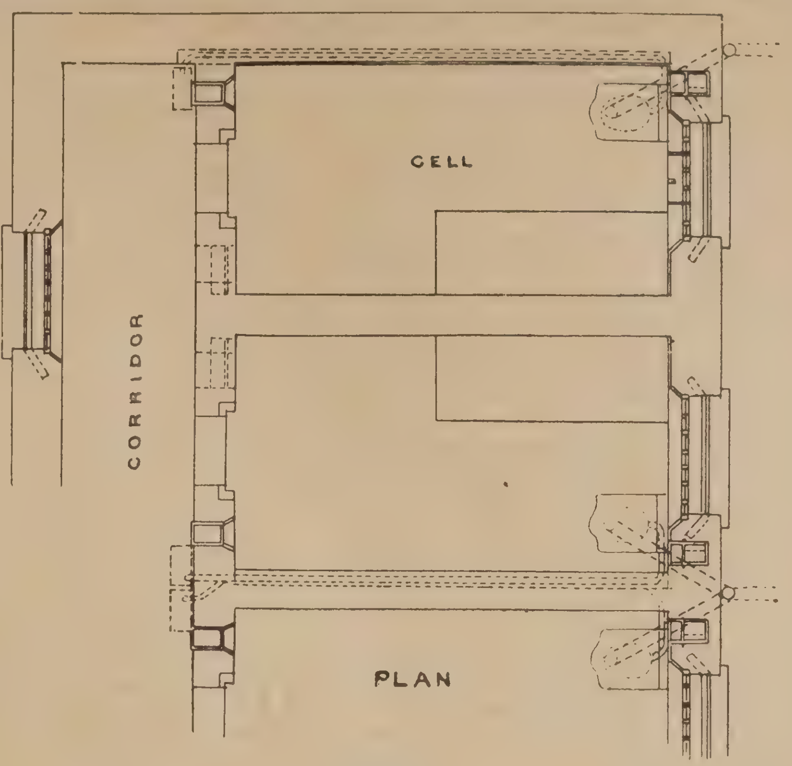

FIG. 1.

In Fig. 2 is given a transverse section through an isolation cell in which the water-closets are omitted, and a seat or bed fixed under the window with heating pipes below, as shown also in Fig 3, which gives a section through the corridor, where a lavatory basin is fixed. From these diagrams it will be perceived that the heating and ventilation is effectually arranged for. Warm air may be admitted into the isolation cells from the corridor, in which circulating hot-water pipes may be laid in a channel under the floor, with inlets to the cells near the ceiling and also 12in. from the floor; or the apartment may be warmed by heating-pipes laid in the cells just above the floor, enclosed by a casing to form a chamber in which the air, brought directly from outside the building, is put in contact with the hot-water pipes and then admitted into the cell through gratings. In each of these arrangements fresh air from the outside should be admitted in sufficient quantity to supply the cells, the inlets being equal to 54in. for each cell. The area of the clear openings in the gratings should be equal to that of the inlets, and care should be observed that the gratings are arranged to prevent them from being made means of communication. The inlet openings for fresh and warmed air into the cells should have as few bends as possible; they should be provided with means of regulation by the inebriate inmate, but not be capable of being quite closed. Foul air should be extracted from the cells by means of flues, having a superficial opening area of not less than 54in. per room. These flues should be led to the outer air in as direct a course and with as few bends as possible, but may pass into a main horizontal trunk and vertical shaft, which should be equal in area to all the flues led into it. The shaft should not be less in height than two-thirds of the horizontal distance from it of the most distant apartment ventilated into it, and it is desirable that means should be provided to rarify the air in the shaft to assist extraction, or some form of induced-current ventilator at the outlet should be provided; the openings into the extraction flues should be as far as possible from the inlets for warmed air into the cells.

Artificial light should be provided for the isolation cells, accessible only from the corridor. Each apartment should be provided with a fixed wooden bench, about 30in. wide, to serve as a seat or bed, and there should be a bell or gong communicator to enable the inebriate patient to call attention when necessary. The doors and frames should be very strong (perhaps even lined with sheet-iron), and have glazed inspection holes, with a cover on the corridor side, such as is used for police cells, and a strong flush lock to open from the outside only. The doors may be hung to open outwards, in which case two barrel-bolts must be fixed in addition to the lock, to give sufficient security. It will be seen from the above that the arrangement of an isolation room or cell for an inebriate patient requires very careful consideration, and that there are a number of points that require skilled attention.

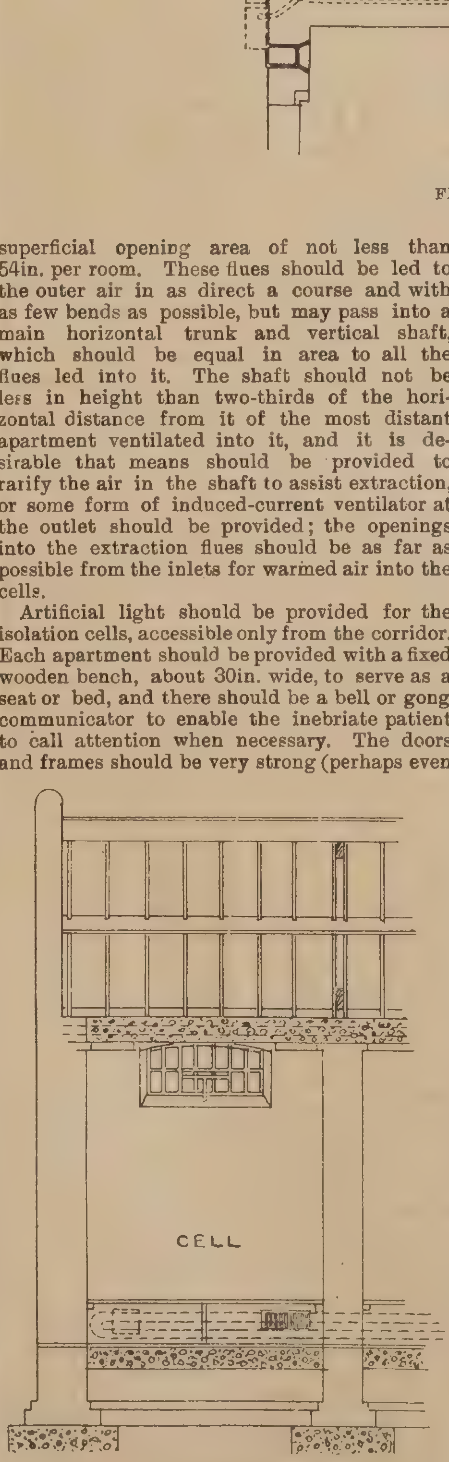

FIG. 2.

Visiting rooms of sufficient size, with lavatory and w.c. accommodation conveniently near, should be provided within a reasonable distance of the general entrance and of the inebriates' wards.

There should also be suitable sleeping accommodation for the domestic servants of the establishment: in large reformatories it may be convenient to provide in detached buildings sleeping accommodation for some of the attendants, and cottages for those of them who are married.

The general stores, workshops, laundry and similar offices should be on the north side, with entrances to them on that side, and be so arranged that there need not be more than one outer entrance to the steward's and workshops' courts, but conveniently placed for control by the steward from his office.

The various wards and apartments may be connected by covered ways or passages of communication, which ought to be no wider than necessary to give convenient access to the several parts of the building. As previously mentioned, steps should be avoided in these corridors as far as possible, and no incline should exceed one in forty.

The dormitories for the inebriate patients may have the beds arranged as shown in Fig. 4, that is, two beds between each window; in this illustration inlets for ventilation are shown between each window, while outlets for the vitiated air are provided in the roof.

The walls generally should be plastered or cemented internally; those of lavatories, bathrooms, water-closets, sculleries, laundries and kitchens should be lined to at least dado height with glazed bricks or tiles, and where the walls above are plastered it is an advantage to use adamantine plaster or Parian cement.

The windows of the day-rooms and corridors should be of sufficient size and number and bear due relation to the requirements of the room; the lowest clear glass should not be more than 2ft. 6in. from the floor; they should have wood

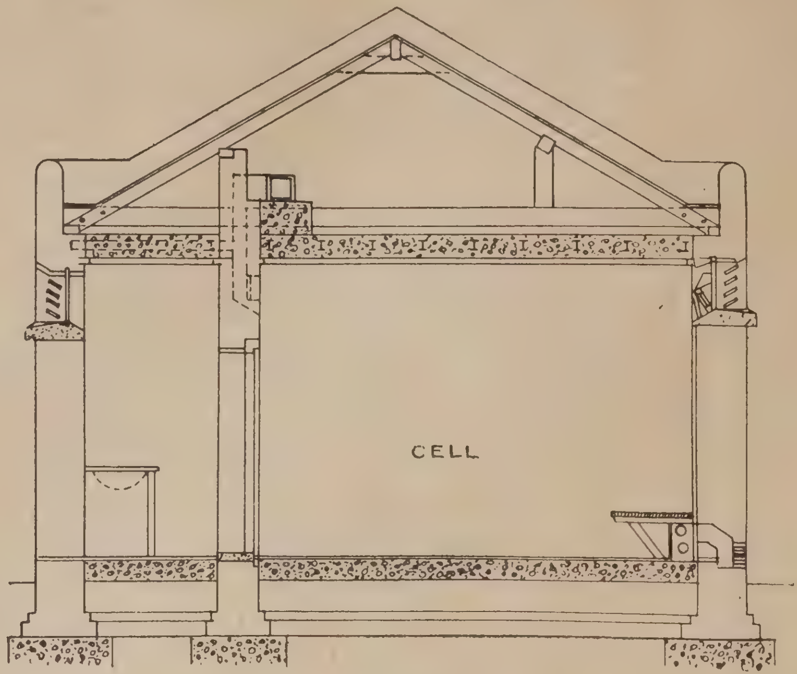

FIG. 3.

sashes, double hung, and be made to open easily so as to allow a free circulation of air. The walls below the sills of windows in dormitories may be splayed, but in day-rooms and wide corridors they should be recessed to admit a seat, if desired.

In the dormitories the windows should, as a general rule, not be placed with the bottom sill more than 4ft. from the floor; if not otherwise protected, the windows in all parts occupied by patients must be stopped so as to allow them to be opened top and bottom 5in.; the panes should be of moderate size, and in view of the suicidal character of some inebriates it would be safer for the sashes to be hung with concealed cords.

So far as is practicable, horizontal and vertical fireproof construction should be adopted, and the ceilings next below the roof should be constructed of fire-resisting materials.

In planning institutions for inebriates it is considered desirable to arrange for the separation from other inmates of persons of superior refinement and education, and men and women should not be allowed to be received in the establishment unless there is absolute separation of the grounds and buildings used by them.

The plans for an inebriates' reformatory should be prepared by the architect with the full understanding that the scheme of treatment is to be based on the principle that the inmates are to be detained for reformation, rather than for punishment, and towards this principle alike should be directed the dietary, the discipline, the recreations, the religious and moral training and the occupations of the inebriate patients.

Inebriates' reformatories are likely to be erected in many districts, and the best authorities state their belief that fifty per cent. of habitual drunkards might be permanently cured; but though the treatment is for reformation yet the building must be to a considerable extent a prison, a hospital and an asylum.

SHEWING INLETS FOR FRESH AIR and EXTRACTION TUBES AND VENTILATORS.

FIG. 4.

Masters and Men.

The North of England Building Trades Dispute.—The arbitrator appointed by the Board of Trade in the dispute between the building trade employers and the bricklayers in the Newcastle district has given his award in favour of the masters. The men's demand was that their wages should be 11d. an hour instead of 10d. The masters offered that the wages should remain unreduced for a prolonged period; the men went on strike last June. The arbitrator has decided in favour of the employers.

The Sheffield Building Trades.—The workmen in the building trades of Sheffield held a meeting recently to consider the question of improving their organisation. The meeting took place under the auspices of the Building Trades Federation of Sheffield and District, which is some seven years old. This body has recently joined the Northern Counties Building Trades Federation, which now comprises the workmen of nearly a dozen towns. Resolutions supporting the principle of federation, and emphasising the necessity of more unity among the various trades to meet the increasing combination of employers and pledging the meeting to use every endeavour to strengthen the position of each individual society in the building trades, so as to help forward the cause of federation, were unanimously adopted.

The Cement Trade.—Following upon big discharges of men from the works at Rochester included in the combine of Associated Cement Manufacturers an intimation has been given that a new scale of pay for the workmen, representing a reduction of 40 per cent. in wages, will be introduced. The men affected by this order include those engaged in loading, unloading, and wash-mill work, kiln drawers, crane drivers and burners. About 400 men have left work. It is stated that the decision was come to owing to its being found impossible to manufacture cement at a price to enable them to compete in the continental and foreign markets and in supplying our own Colonies. At present notice of the reduction has only been given to the men employed at the Bridge and Quarry Works, Frindsbury. At Gillingham the millers have struck for 1d. a ton increase. Although they number only a dozen their action affects the whole factory. Half the factory has been shut down, affecting over one hundred men.

A Hull Dispute.—An extraordinary dispute which occurred recently between the operatives in the building trade in Hull and a firm of brewers, has ended in a victory for the men. The brewers are Messrs. Worthington and Co., and the complaint laid against them was that they had a contractor working at some of their property in Hull who did not pay the standard rate of wages. On Monday, the 4th inst., a meeting, at which 1,100 men attended, was held, when a resolution was passed pledging those present to abstain from frequenting the houses owned or supplied by Messrs. Worthington and Co. The boycott was strictly carried out both in Hull and in the district. The local manager of the company assured a deputation from the men that it was not the desire of his firm to employ inferior labour or to pay less than the standard rate of wages. As a matter of fact they were, he said, paying the contractor the full price, and if the labour was inferior they would be the sufferers. He promised that the cause of complaint should be immediately removed.

Standard Rates of Wages in 1900.—The Report of the Board of Trade Labour Department upon the Standard Rates of Wages and Hours of Labour in force in the United Kingdom at the beginning of 1900 has recently been published. The report gives the rates of time-wages and the hours of labour (exclusive of overtime) recognised in a large number of important industries in the principal towns of the country, and gives the wages and hours recognised at January 1st, 1900, and also at the beginning of each long series of years, while in another section are included tables showing the percentage variations which have been made in the course of a lengthy period in the wages of coal hewers, ironworkers and cotton operatives, and returns of the cash wages and earnings of agricultural labourers. A list of working rules and other documents regulating wages, hours of labour, and other working conditions in operation on January 1st, 1900, is given in an appendix to the volume. The report deals most fully and completely with the wages of bricklayers, masons, carpenters and joiners, slaters, plumbers, plasterers, painters and labourers. The report can be obtained from Messrs. Eyre and Spottiswoode, London, E.C.; John Menzies and Company, Edinburgh and Glasgow; or Hodges, Figgis and Company, Limited, of Dublin.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stone Staircases.

GALLATOWN.—KIRKCALDY writes: "I am obliged for the reply to my query on page 14 of your issue for February 6th, but I still wish to know what rule 'I. W.' applies to determine that one wall should be 14in. thick and the other 18in. What amount of leverage is exerted by the hanging steps upon these walls, and how would the stability of the top flight be affected if the wall were only carried up, say, 4ft. above the level of the top floor? A gentleman tells me that he has seen such a stair with *both* ends open and no support underneath except the abutment in the feather edge of the step. Is this correct?"

I know of no fixed rule that applies, but assume the wall that carries the stairs has also to carry the floors of the apartments. This being so, I have given the least that I consider safe for the work the walls have do, and it must also be considered that the staircase in question is as a cantilever, but as to what amount of leverage is exerted I am not prepared to say. I think the stability of the top flight would be ensured if the walls were carried up as proposed. With regard to the last paragraph of the query, such a stair would be an impossibility with only the ordinary abutment on the feather edge of the steps. But a staircase can be made self-supporting by using an additional thickness of stone, making the back rebates of the steps "arch joints," and by working off the additional thickness about 12in. or 15in. from the end with an ogee it does not offend the eye. This is probably the kind of stair referred to. I. W.

Submitting Plans for "New Buildings."

AN OLD SUBSCRIBER writes: "A has pulled down an old house abutting on the main street within an urban district, where the Model By-laws of the Local Government Board are in force. He intends to rebuild on the same front foundations as the old house, but with increased depth, adding a storey in the roof and forming a new interior, without submitting plans to the council for approval, his contention being that it is not a 'new building,' and that he is not therefore required to submit plans. Is this so, or have the council control of the air-space in front applicable to a new building, and if not what steps should the council take in the matter?"

Both technically and in fact the house is a "new building," except in so far that it may be erected to the same frontage line and to the same height as formerly. Plans must be submitted, and the by-laws complied with.

G. A. T. M.

Assistant's Salary during Illness.

ROTHERHAM.—A READER FROM THE FIRST writes: "Is it usual in the profession for an employer to continue to pay an assistant's salary during his absence through sickness? In one instance an assistant who has been absent for a week writes stating that in all probability he will be able to resume his duties in the course of another week, and requesting that his salary may be forwarded. This, however, is refused."

For the credit of the profession it is to be hoped that there are very few architects who would deprive an assistant of his salary during illness, unless the illness be one of many months' duration, when, after a reasonable time, it is only to be expected that notice of dismissal would be served, or, at best, that salary would cease and the berth be kept open. We have occasionally—very occasionally—heard of treatment similar to that described by our correspondent, and usually when the assistant is so circumstanced that he dare not resign his position and sue for his due; and we suggest that such a case is best met by the assistant himself and *all* his fellows in the same office seeking employment elsewhere. G. A. T. M.

Measuring Pattern Glass.

SHREWSBURY.—D. and D.-L. write: "In measuring pattern glass, is not 1in. sufficient to allow in each sheet for any fractional part of an inch? In some pattern glass we have lately measured the glazier claims 1ft. for any measurement exceeding 10in."

The custom is to measure fractional parts of inches as full inches, and unless the equalising of the pattern in each square necessitated extra cutting, and a larger percentage of waste than is usual in cutting up glass sheets, there seems no reason why "custom" should be departed from; but in this latter contingency any claim should preferably be allowed for in an extra amount rather than in increased measurement. Reading between the lines and wording, the query as to whether it is customary to allow as a full foot any *superficial* measurement less than a foot enables the reply to be given that such is the custom for some kinds of glass, though the caprice of the glass merchants would seem to be the only rule governing the matter. H. E.

Architect's Fees for Valuation.

GALLATOWN.—KIRKCALDY writes: "With regard to Mr. Brand's reply on page 496 of your issue for January 30th, the fees seem high, and I think there must be a misunderstanding. The architect in question is not licensed as an appraiser, so why should the fees agreed upon by the surveyors and valuers have anything to do with him as a private agent? From page 85 of 'Specification,' Part 4, I understand that any architect can value property for the information of one party only, and can charge a fee for doing so. It is this fee that I wish to know about. The same paragraph of 'Specification' refers to the Act 46 of George III., chap. 43, applying to England and Wales and extended to Ireland, but as I am more interested in the question of architects in Scotland valuing for the information of one party and charging a fee, which I am told is not legal, perhaps Mr. Brand can say if it is so, and what the fees are."

It is entirely a question of agreement between the persons interested, and being a private matter, an architect cannot legally charge anything, though I have known architects (and even licensed valuers) charge a fixed sum of 1 per cent. on every £100 worth of property so purchased privately. There is practically no fixed scale for unlicensed persons. I have known instances where a small fee was charged, as low as £3 3s. for small properties worth £200 or £300; in one case £21 was paid in connection with a property worth £3,000. It is practically an arrangement between the architect and the person concerned. J. E. B.

Alterations in Competition Design.

GLASGOW.—J. M. writes: "In a limited competition A was the successful architect, his estimate for the proposed work being £15,000. Each of the other competitors were awarded a nominal premium. In carrying out the work large portions of the competitive design were omitted, and other work was done costing altogether £10,000. How should this be charged?"

It would be best to consult a copy of "The Professional Practice as to the Charges of Architects," to be obtained from the secretary of the Royal Institute of British Architects, 9 Conduit Street, W., price 7d. post free. If the alterations in the design were made before tenders were invited, it seems probable that 5 per cent. commission can only be charged upon the actual cost. G. A. T. M.

Elementary Mechanics and Physics.

OXFORD.—B. H. C. writes: "Kindly state what books should be studied for elementary mechanics and physics for the preliminary examination of the R.I.B.A., and whether I could prepare myself without assistance?"

Newth's "Natural Philosophy" is probably the best book. It is thoroughly sound, and not too difficult of comprehension. Whether, however, the subject can be mastered without assistance or not depends upon the capacity and education of the student. G. A. T. M.

Strength of Rolled Joists Embedded in Concrete.

LONDON.—ENQUIRER writes: "Could you give any formulæ, data, or reference as to determining the increase in strength given to rolled steel joists in a floor in which they are completely embedded in concrete. For example:—An 8in. × 4in. joist, 24ft. span (clear), I find to be equal to a safe distributed load of 4 tons, or 4 cwt. per foot run. Now, if these joists be placed 2ft. apart, but buried in concrete, to what extent are the joists increased in strength? I have some floors to design of this construction for a load of 2 cwts. per foot super. (gross) which must be kept as light as possible."

A rolled joist is not increased in strength by being embedded in a concrete floor unless it is so narrow as to be deficient in transverse stiffness and liable to fail by buckling sideways. The concrete itself under ordinary conditions of manufacture has little value as a beam over long spans, but the two materials together so divide the work that an increase of load is possible. In some cases known to the writer the combination of the two materials enables the rolled joists to carry more than double the load that would be safely supported if they were free. An 8 × 4 × 25lb. rolled steel joist of 24ft. span would require a factor of safety of $\frac{\text{span ft.}}{3{\cdot}5 \text{ depth ft.}}$ = say, 10 if free, or, say, 5 if embedded in concrete, to avoid excessive deflection. This would make the safe load about 3¼tons distributed, or, $\frac{3\frac{1}{4} \times 20}{24 \times 2} = 1{\cdot}354$cwt. per ft. sup. gross load, which would manifestly be too little. For a span of 24ft. the writer would use 12 × 5 × 39lb. rolled steel joists, having a modulus of 42·41, the distance apart being found thus:

Bending moment (M), Moment of Resistance (R)

$$M = \frac{WL}{8}, \qquad R = ZC$$

$$\therefore W = \frac{8\,ZC}{L} = \frac{8 \times 42{\cdot}41 \times 30}{24 \times 12} = 35\tfrac{1}{3}\text{tons}$$

distributed. 2cwts. per ft. sup. gross = say, ½cwt. per ft. sup. for weight of floor × 1½cwts. per ft. sup. for external load. This will allow for a maximum of 6in. thickness of concrete. Then 24ft. span × 2cwt. per ft. sup. × xft. width of centres = 35tons, allowing the odd ½ton for weight of joist. Therefore $x = \frac{35 \times 20}{24 \times 2}$ = 14ft. 6in. centre distance of main joists. A 2 × 2 × ¼ angle-iron should be riveted to the web on each side level with under side of concrete, and 6 × 3 × 13lb. rolled steel joists placed 2ft. 6in. centre to centre between the main joists, and attached to them by angle cleats. HENRY ADAMS.

Copyright in Designs.

LONDON.—ANXIOUS writes: "I am afraid there was a misunderstanding in regard to my former query, which appeared on page 33 of your issue for February 13th. I did not prepare a perspective at all, but was engaged by an architect to prepare a scheme (including all necessary drawings), which won the competition in question and is now being carried out under the architect's name (but really by myself). I can satisfactorily prove that all the design, &c., was my own. Would it be legal for me to have a perspective prepared and to insert it in any of the building journals simply as a design bearing my name without mentioning the architect's name in any way? If this is not right would it be possible to slightly vary the design, but still to retain the main character of the work, and then be still within the law? I have an impression that he could not do anything unless his design were copyrighted."

You do not state the extent to which the person who engaged you contributed to the production referred to. Upon the facts stated you are the author of such production, and can use it in the manner referred to since you do not appear to have parted with your ownership of the production, but to have merely permitted its use for a specific purpose. A. O. H.

Duties of a Borough Surveyor.

Glasgow.—Registered Plumber writes: "What are the duties of a borough surveyor, and what course is necessary to qualify for such a position? I already hold the Scottish Sanitary Association certificate."

It is not absolutely necessary to have passed any examinations in order to take the position of borough surveyor. Surveyors under the London Building Act of 1894 have to pass an examination held by the Royal Institute of British Architects. Particulars can be obtained from the secretary of the Institute at 9 Conduit Street, W. It would be as well to pass the Surveyors' Institution examinations, particulars of which can be obtained from the secretary, 12 Great George Street, Westminster, S.W. In Scotland the applicant for an ordained surveyorship has to satisfy an examining body as to his professional qualification, and is then "ordained" or "invested" in his office by the Sheriff of the Lothians and Peebles, or by the Lord Provost, magistrates and Council of Edinburgh. There is a Society of Ordained Surveyors that holds examinations which it would be as well to pass. The address of the Secretary to the Board is 56 Queen Street, Edinburgh.

Damp in Houses.

Longtown.—Inquirer writes: "I have several houses built of Cumberland sandstone. The walls are 18in. thick, yet the interior is very damp. It appears that this dampness arises from two causes: the very porous nature of the stone and the absence of a damp-course in the walls. What is the remedy?"

The porous nature of the stone may be treated in several ways. By painting externally with Szerelmey's Stone Liquid, Orr's Petrifying Liquid, or any similar preparation; these form a waterproof coat externally, but generally discolour the surfaces to which they are applied, and require renewing at intervals. By using the same preparations internally: in this case the appearance of the wall is not affected, but the rain is still free to penetrate the wall and inevitably destroy it in a short time. By painting with oil paint: this requires periodical renewal by forming a cavity on the inside; this is done by building an ordinary lath and plaster (or expanded metal and plaster) partition, the uprights being nailed to plugs inserted in the walling. This would materially reduce the size of the rooms if already small. Weather tiling or slating might also be suggested, but it is costly. The matter of the damp-course is more difficult to advise upon. If the building is of coursed masonry the theoretic solution is to remove one course in sections and then to insert a damp-course. This is, in fact, the only solution, a very expensive and troublesome one, and probably (we have not seen the building) impossible.

R. W. C.

Efflorescence on Walls.

London, S.W.—E. E. B. writes: "A friend of mine has built thirty-eight cottages in Essex: the last two are now being plastered. They are built with grizzles and place-bricks, and are plastered with sirapite plastering; the sand is sharp and clean. Recently unmistakable signs of efflorescence have appeared on the external walls, and internally the walls seem to be much damper than the rapidity in building would account for. The cement rendering in the scullery has entirely left the wall and bulged out; the recent frost might perhaps account for this, but I do not think it can account for all the indications of damp throughout the whole thirty-eight houses. The shape of the bricks comes out in dark lines on the plastering. Are these houses likely to be permanently damp, and is it because the bricks are made of clay containing too large a proportion of chloride of sodium?"

We should say that the damp and bulging are both due to the use of inferior materials and the rapidity of construction indicated. It is impossible for us to speak definitely, however, as we have not seen the work, but "grizzles" and "place-bricks" do not seem to us the right material to use even for cottages. You do not state the composition of your cement rendering, nor whether the work was done during or just before a frost. We assume that your walls are 9in. thick, and have not yet been thoroughly dried, as the houses are all in course of construction. The dark spots on the wall point to the bricks being so porous as to form water channels in the thickness of the wall, and if (as suspected) they contain an excess of chloride of sodium, they must be very inferior grizzles made from seashore or salt-formation clays; bricks which warp and twist and absorb moisture for years, and ought never to have been used at all. The houses will never be satisfactorily dry. R. W. C.

R.I.B.A. Intermediate Examination.

Windermere.—F. H. W. writes: "Is it necessary to know algebra, mechanics, physics and trigonometry for the intermediate examination of the Royal Institute of British Architects, provided the preliminary examination has been passed? If so, to what extent need these subjects be known?"

A knowledge of the four subjects named is necessary to pass the intermediate examination. See a reply to a similar enquiry on p. 477 of of our issue for January 23rd last.

Collar-Beam Roof.

Sheffield.—J. M. writes: "Would a roof framed as shown in sketch (not reproduced) in which the spars are tied across half-way up by the ceiling joists, with no purlins, be satisfactory with grey slates? Slope of roof 45 deg. The length of the building makes purlins undesirable, as framed trusses would be required to support them."

The roof sketched should be quite satisfactory; each pair of rafters and their ceiling joist becomes a collar-beam truss and would be suitable for a span of 15ft. The rafters should be notched on the wall-plates so as to give them a horizontal bearing. HENRY ADAMS.

GLASGOW EXHIBITION, 1901.

DECORATING THE GRAND DOME.

THE decoration of the grand dome of the Glasgow International Exhibition will be completed in about a week's time. About seven months ago the commission to execute a scheme of figure decoration was given to two young Glasgow artists, Mr. John Dall and Mr. David S. Neave, neither of whom had previous experience in mural painting. To the difficulties attendant on the designing of a space 226ft. in circumference and 65ft. in height, the artists had, of course, to face those matters which make dome decoration so much more onerous and troublesome to gauge than panel painting—the upward incline of the cup and the rounding of it. "The work now completing," says the "North British Daily Mail," "shows a design gay and light in its motive as befits the great crown of our summer palace, suave and elegant in its lines, and when the obstructions are removed we believe the committee will have every reason to feel gratified in their choice of artists, and Mr. Miller in having his noble structure so tastefully beautified."

There are thirty-two figures in all. On the cup or curved portion of the dome two large-winged angels with palms and laurels face one another, each with an attendant figure at either hand, the composition being connected by six groups of flying amorini. A gilt frieze runs round the circle, and below this are fitted at the window spaces eight seated figures in four groups, symbolic of industry, commerce, science and art. The whole is set in a very decorative landscape background of rolling hills and trees, over which stretches an evening sky rising from the yellow green at the base of the cumuli clouds to the high salmon-pink on the fringe of the cirrus. Above the violet sky arches to the top, and the zenith is studded with stars. The decoration begins at the second row of windows, 60ft. from the floor, and rises to 125ft. The large-winged figures are 18ft. from toes to helmet and 23ft. to the tip of the wings, the attendant ones measuring 16ft., and those seated at the base about 8ft. in height. Each form is silhoutted in white against its background.

The colour scheme is pitched in a very high key, but the artists, in avoiding any glaze or shine on their pigment, restrain the whole well back in its place, and the big simple lines of composition observe the just principle of mural decoration—and one not seldom neglected—that the painting should accentuate and not disguise the architectural form. Gold is used here and there.

The painting of the figures and accessories has been done by the artists within the Exhibition precincts in the brief space of six months. Each figure has been cut out of its canvas and hoisted into its place, where it is fixed to the wall. The work of assisting the artists and painting this scheme of landscape and cloud background has been managed by Messrs. Charles Carlton and Sons, 189 St. Vincent Street, Glasgow.

Professional Practice.

London.—Mr. Hans Lowenfeld's newly-erected theatre, the Apollo, in Shaftesbury Avenue was opened last week. The building has been planned by Mr. Lewen Sharp. The scheme of decoration is cream and gold, all the upholstering being done in crimson and old gold. The seating capacity is for 1,200 persons, and every seat commands an uninterrupted view of the stage, this great convenience being secured partly by the absence of pillars, partly by the fact that the stage slopes less and the various floors of the auditorium much more than is usual. The "rake" of stalls and pit is continuous from front to back, and nothing but an exceptionally obstructive "*matinée* hat" can prevent the spectator from seeing everything that goes forward upon the stage. In the pit comfort has been studied by making each seat a fauteuil. Promenades are provided at the back of the pit, dress circle, balcony, and gallery. A novelty is the creation of two "gallery boxes," one on either side of the house, which will hold a family party. The arrangements for ventilation and heating are of the most complete character; the entire air of the auditorium will be renewed several times every hour, being exhausted by means of pumps, while a system of electric thermometers automatically indicates by means of bells to an operator in the basement the rise or fall of temperature in any part of the house. Draughts have been guarded against by placing at every exit or entrance at least three doors between the auditorium and the street, and the lobbies are warmed by radiators. The exits are so numerous that the house can be emptied in two minutes, while the whole building is fireproof. The stage is large enough for the production of the most elaborate plays. There are twenty-three dressing-rooms, which, with the exception of five, occupy a separate block, with a rehearsal-room. The lighting is electric throughout, and to provide against breakdown two separate companies, each with two circuits, furnish the light. The two special novelties are in the arrangement of the orchestra and the lighting of the stage. The construction of the orchestra, of which Mr. Lowenfeld claims to be the author, is intended to produce the proper relation in the sound of the various instruments to each other, and to avoid any possible muffling by loss of tonality. The floor space of the orchestra is in the form of a hollow oval, and the surface is hard and highly glazed. A wooden sounding board is placed over this hollow surface, and a three-tier rostrum on glass legs stands on the sounding board. The violins are placed on the highest tier, the wood wind and remaining strings on the next, while the lowest part is assigned to the brass and drums. By this means the thin violin sound waves rise before being mixed with the stronger wood wind and bass sounds, while the brass and drums are so removed that they do not interfere with either. The hollow floor and sounding board reflect the whole mass of tone. The idea is a free adaptation of Richard Wagner's construction at Bayreuth. A novel method of throwing light direct on the faces of the actors, also stated to have been invented by Mr. Lowenfeld, has here for the first time been practically carried into effect. From a space between the stalls and dress circle boxes limelights illuminate the stage on the level of the actors' faces without destroying the illusion, as lights thrown from the circle do, a plan frequently adopted in America. By means of the scheme now adopted the faces are lit directly from the front and equally from both sides, so that the objectionable shadows are avoided. This plan is quite new, and seems a step in the direction of ultimately realising Professor Herkomer's dream of abolishing the footlights. The decoration of the box-fronts and circles is of white and gold. The walls are of a deep crimson, the seats and hangings red of a lighter shade, and on every seat is worked the badge of the "Goman" tribe of gipsies, a curious lion and lizard device, which has been adopted as the theatre's crest. The act-drop is after Watteau, to be in keeping with the Louis Quinze scheme of ornament and has been painted by Mr. Hubert Hooydonk. In order partially to empty the auditorium between the acts after the Continental fashion, each separate part of the house has a separate promenade and foyer. There is plenty of room everywhere, both before and behind the curtain, the arrangements behind including many novelties in the way of labour-saving and time-saving machinery for the handling of scenery.

Norwich.—The new Technical Institute has recently been opened. The area of the site on which it stands is about 18,000 super. ft., and the building has a frontage of 190ft. to the river and of 120ft. to St. George's Bridge Street. It consists of basement, ground floor, and first and second floor. Its general design consists of semi-octagonal piers running through from the basement to the springing level of arches on the first floor windows. An arcading of semi-circular arches connects the heads of these piers; each alternate pier is much larger than the remainder, and is carried through the second floor and parapet to terminate with cappings or with finials above the parapet. Roughly speaking the building is shaped like an L, the river being parallel with the shaft of the letter. It is of local bricks throughout, with Cossey brick mouldings and dressings, and stonework to the portico. The main entrance is in St. George's Bridge Street, with an entrance from Monastery Court. Access to the whole of the floors is by means of a principal staircase, leading from basement to roof. There is a large landing at each floor, from which a corridor runs from east to west the whole length of the building, and there is a second staircase at the east end. The second floor is devoted to art. Parallel with the river—*i.e.* on the north side—is an elementary room, a life room, and a room 25ft. by 90ft. The whole of the rooms are supplied with Tonk's patent fittings, by which casts, pictures, drawings, &c., can be conveniently suspended from the walls. Facing St. George's there is a modelling and casting-room, which is fitted up with modelling stands and with large sinks for casting purposes. To the same aspect there is a design room, fitted up with lecture table and students' tables, and also with a novelty in the shape of a white board for design purposes. On this floor is an art master's room, and a room for the assistant art teachers. The roof is sloping and glazed, and curtains are arranged in it by which the light can be adjusted. The first floor is devoted chiefly to science. Parallel with the river there is a balance-room, which adjoins the chemical laboratory, which is 54ft. by 24ft., and which is fitted up with students' working benches, fume closets, demonstration table, blackboards, &c. Adjoining this room is a preparation room, which separates the chemical laboratory from the chemical lecture room. The chemical lecture room is fitted with raised gallery designed so that the lecturer can always see the students and the students can always see the demonstration table. There is a spacious platform and lecture table, which is supplied with water, gas, compressed air, and electric power. Immediately behind the lecturer's table is a large fume closet, and on each side is a large sliding blackboard. Overhead are diagram frames. Adjoining the lecture theatre is a smaller class-room for general science work. On this floor, facing St. George's, there is a photographic room. There is also a large lecture hall, which will be devoted to experimental physics. This room is somewhat similar in its fittings to the chemical lecture room. In addition on this floor there is a drawing office, a room 24ft. by 42ft., fitted up with a lecture table, students' drawing tables, &c. There is also a room for the assistant science teachers. On the ground floor is the general entrance from St. George's, consisting of a vestibule, with a hall 14ft. by 12ft. On the right is a general office; on the left is the entrance to the principal's room, which opens into a committee room 24ft. by 38ft. On this floor, parallel with the river, there is first a students' common room, and two very large rooms which will be devoted to boot and shoe work, each measuring 24ft. by 54ft. Adjoining is a room which will be devoted to dress-cutting and needlework. In the basement, and parallel to the river, there is a students' common room. Next to this is a space of 24ft. by 54ft., which is completely devoted to the heating and ventilating arrangements, which have been carried out by the Blackman Ventilating Company, Ltd., of 443 Holloway Road, London. There is also a physical laboratory on this floor 24ft. by 84ft., fitted up with students' working benches, lecture table, blackboards, apparatus cupboards, stone slabs for delicate work, &c. Facing St. George's there is a workshop, measuring 24ft. by 49ft., which is to be devoted to plumbing; this room will contain a large cauldron for the melting of lead and the purification of used solder, together with a number of stoves for the heating of metals. It will also contain benches and other apparatus for this craft. Adjoining this is a photometric room, which will be used for experiments in light, such as the comparison of candle powers of different sources of illumination. Next to this is another room, 24ft. by 41ft., which will probably be used as a dynamo shop. The basement is below the level of the river. The remainder of the building is really an adaptation of part of the old Guardians' offices. It consists of a metal room, standing in an old crypt, and of a day manual training room, 30ft. by 32ft., which will be devoted in the day time to the training in woodwork of boys from the elementary schools, and in the evening to subjects like carpentery, joinery, and cabinet making. Above these are two other rooms, which will also be devoted to manual training and to kindred subjects. The Institute is lighted throughout by electric light. The architect is the City Engineer, Mr. A. E. Collins.

Selby.—A Cottage Hospital, having attached to it a Dispensary, was opened recently. The hospital stands at the bottom of New Lane, opposite the School of Art, and makes no pretence to architectural merit. It is a two-storey building of brick, with stone dressings. On the ground floor are waiting-room, dispensary, matron's room, store-room and accident ward, with bath-room. This ward is 22ft. by 26ft. by 12ft. high, and the walls are plastered in Portland and Parian cement. The floors are of pitch-pine boards, and the place is heated by means of Shorland's patent downdraught-stove. The ventilation is on an improved system. Upstairs are three bedrooms, and adjoining are the bath-room and linen closets. The roof is covered with Penrhyn slates and Staffordshire red ridge. The yard at the back is laid with cement concrete, and in front is an ornamental wood palisade. The cost of the building is said to have been about £1,500. It was erected by Mr. T. S. Ullathorne, of Selby, from designs by Mr. T. Brownlow Thompson, of Hull. The sub-contractors were Mr. A. R. Swift (plumbing), Mr. George Swift (painting), Mr. T. W. Swift (electric bells) and Messrs. H. Williamson and Co. (slating).

Steyning, Sussex.—A new Steyning Union Workhouse has been erected in the parish of Kingston-by-Sea, facing the Old Shoreham Road. The architects are Messrs. Clayton and Black, of Brighton, and the builders, Messrs. Parsons and Sons, of Hove. The construction has taken two and a half years. One of the advantages of the pavilion system upon which the Workhouse has been erected, is that it facilitates classification; that is, it enables a distinction to be made between deserving cases and those of a less genuine character, besides giving opportunity for better general supervision. There is a total accommodation for 480 inmates. The site, which is entirely surrounded by a 7ft. flint wall, covers 23 acres, 14 of which are laid out in market gardens. Just within the entrance are the quarters for the porter and porteress. The eastern half of the block contains the receiving wards, for males downstairs and for females upstairs. In the western side are the casual wards, and there is a separate entrance for males, communicating with the main road. In the receiving wards there are four wards for males and four for females together with a bath-room and a room for an attendant. Each ward is separate, self-contained, and fitted with sanitary appliances. To each set of wards also is attached a store for the paupers' own clothing. The upper, or female receiving wards are approached by an outside staircase and a covered balcony. There is no communication between the wards except from the outside. The casual, or vagrants' wards are all on the ground floor, and consist of associated ward cells together with bathrooms and sanitary accommodation. Hot and cold water is provided, and in the female section is a special bath for children. Attached to each male cell is a working cell in which the occupant can be put to stone breaking, pounding, oakum picking, &c., according to his capacity. The cells in both wards are warmed by hot water, and in each department in the tramp ward there is bell communication with the porter's lodge. Through the archway between the two wards is a road leading to the stables, boiler house, coal bunkers and stores, past the workhouse into the garden. Opposite is the main entrance to the administration block, passing on the right of the hall the master's office, and on the left a commodious committee room. From the corridor, which runs at right angles to the entrance hall, access is gained to the lavatory accommodation for the committee, and similar accommodation for ladies upstairs. Opposite the entrance hall, across the corridor, is the entrance to the master's house, which contains on the ground floor two rooms with kitchen and scullery, and on the upper floor three bedrooms, bathroom and lavatory. The dining hall, which is also to be used as a chapel, is reached on the ground floor from the corridor, which surrounds it on three sides. It is a lofty apartment, 86ft. in length and 40ft. in breadth, with a height of over 30ft. to the centre of the roof. It is lighted by windows going up into the pitch of the roof and has six entrances beside two doorways leading into the kitchen. At the south end of the room is a gallery over the corridor. A tiled dado runs round the apartment and the walls are in two shades of terra-cotta, with white friezes and cornices. The hall communicates directly on the north side with the kitchen, which is fitted with cooking apparatus sufficient for coping with the needs of 600 people. At the south-eastern end of the dining-hall are clothing stores and the matron's cutting-out room, officers' mess-room with stores above, and bathrooms and lavatories. The male dormitory blocks are divided into two portions by a corridor, the division being continued right up to the roof, thus making it practically two buildings, and the walls being specially constructed the risk from fire is minimised. All the floors in the building are fireproof. The outside walls are hollow, in order to prevent damp. The day wards are 64ft. long by 18ft. wide, with the addition of long bays on the south side. They are 10ft. in height

Attached to each day ward is a lobby with a sink and hot and cold water. There is a dado of glazed bricks round each room and the walls of the rooms are plastered and distempered. The dormitory wards, which are above the day wards, are of similar dimensions and are constructed in precisely the same way, except that they are without bay windows. Each dormitory is supposed to contain 30 beds, none of which will be placed under a window. They will, instead, be arranged into rows between the windows. There is lavatory accommodation attached to each dormitory. In each half of the dormitory blocks is a room for an attendant. The women's dormitory blocks are of exactly the same kind as those for the men. The big pounds are situated in the south-east corner of the garden. Under the western boundary wall are a range of sheds, root stores, coal stores and workshops. The boiler house is to the north-east of the administrative block. The boiler chimney is about 84ft. high above the ground, and is about 100ft. high from its foundations. The laundry consists of a receiving room, a foul-linen wash-house, containing large slate washing tanks, high-pressure washing machine, wash-house for ordinary purposes, with ordinary fittings, laundress's office and store room, large ironing room and delivering room, while upstairs is another drying room. In this building is the engineer's shop and a store place in the roof. Under the north wall of the Union is a six-stall stable and a cart shed.

Surveying and Sanitary Notes.

Gosport Drainage. — A Local Government Board enquiry was held recently into the application of the Gosport District Council to borrow £81,153 for the purpose of instituting a scheme of arterial drainage in the district.

Sanitary Work at Bristol.—A Local Government Board enquiry was held recently into an application of the Town Council for sanction to borrow, under the Public Health Act, 1875, the sum of £610 for the provision of a public convenience in Old Market Street. Mr. T. H. Yabbicom, city engineer, prepared the plans.

The Sanitary Assurance Association held its twentieth annual meeting last week at the offices, 5 Argyll Place, Mr. Andrew Stirling in the chair. The annual report set out that "reports as to the sanitary condition of houses, specifications of works required to remedy defects, supervision of such works and issue of sanitary certificates, have been continued on the plan initiated by the association in 1881. Not only owners and occupiers of dwelling-houses of various sizes, but county councils and school authorities, as well as proprietors of large hotels have sought the services of the association, and acted on the advice given in the reports, plans, and specifications of works furnished by its officers. The Council regret still to have to report that the principle of sanitary registration of dwellings and other buildings as first embodied in the Sanitary Registration Bill promoted by the association has not yet received the sanction of Parliament." The chairman, in proposing the adoption of the report, expressed his satisfaction at the continued prosperity of the association. Sir Vincent H. Kennett Barrington seconded the report which was supported by Messrs. Mark H. Judge, H. Rutherford, and Dr. Edward Willoughby and carried unanimously. Mr. Andrew Stirling was re-elected President of the Association, and Professor T. Roger Smith, F.R.I.B.A., and Professor Kenneth Macleod, M.D., were elected vice-presidents.

A Traceried Oak Screen has just been erected in St. Giles Church, Little Torrington, by Mr. Boundy, of the same place. New carved and traceried oak choir stalls are also being carried out by Mr. Rogers, of Exeter. The architect for both works is Mr. Harbottle Reed, of Exeter.

Engineering Notes.

The Isolation Hospital, Barnoldswick, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Embankment Electricity Generating Station (which was fully illustrated in our issue for January 16th) was formally opened on Saturday last. The entire installation will be completed within a few weeks.

"Transbordeur" Bridges.—A Local Government Board enquiry was recently held into the application of the Runcorn Urban District Council for sanction to take up shares of £10,000 in the Runcorn and Widnes Transporter Bridge Company.

Electric Lighting Boards, Limited.—A special demonstration of the electric lighting boards and strips has been given at St. Petersburg before His Imperial Majesty the Czar of Russia, the Grand Duke Waldemar, and a large company and suite. The Czar and the Grand Dukes personally manipulated the lights on the boards.

Sky-scrapers.—The "B. and S." Folding Gate and Lift Company, of 19, 20 and 21 Tower Street, Upper St. Martin's Lane, London, W.C., are about to issue a wall-card giving views of many of the large "sky-scrapers" erected in New York during recent years. On the back of the card are views of one of the buildings in course of construction, and an article on the "sky-scraper." In one of the views six or seven-storey buildings (which are usual here) are seen in comparison with the monster erections of New York.

High-speed Travelling.—Mr. F. B. Behr is to read a paper before the Society of Arts on March 13th on the proposed high-speed electric "mono-rail" between Liverpool and Manchester. The Bill for the construction of this railway will shortly come before a Parliamentary committee. The length of the line will be 34½ miles, and the estimated cost of construction £1,776,821. The cars will be run at a speed of 110 miles an hour, and will accomplish the journey between Manchester and Liverpool in 20 minutes; the quickest time by the present routes is 45 minutes. It is not now expected that serious opposition will be offered to the Bill by any body, public or private.

Train Lighting by Electricity.—Messrs. Vickers, Sons and Maxim are now introducing an arrangement for electrically lighting railway carriages by which current is generated by a dynamo carried in a dust-proof casing under the frame of each coach and driven by a belt from one of the axles. Its most distinctive feature is the method adopted to keep the current at the voltage required by the lamps. The speed of the dynamo is allowed to vary with that of the train, but on its way to the lamps or storage battery the current has to pass through an automatic switch-board, the function of which is to ensure a constant potential of 30 volts. Another regulation is afforded by a resistance, also automatically operated. The Great Central Railway Company has just had a dining-car fitted with the system. The cost of maintenance is comparatively trifling.

Law Cases.

Defective Mortar: A Belfast Builder Fined.—In the Summons Court at Belfast recently a builder named William Hunter was summoned by the Corporation for using inferior mortar in some new houses now being erected at Shore Road, Belfast. Mr. Spiller (for the complainants) said that the material used could only be described as rubbish—a mixture of bad mortar, clay, and road sweepings. So bad was a portion of the work that a person drawing his finger between the bricks would cause the rubbish to come out, although the work had been done six or eight weeks previously. A notice was served on the defendant by the City Surveyor, but he continued to use the material complained of. The magistrates imposed the maximum penalty of £5 and costs.

Fined for not Submitting Plans. — Luke Rawnsley, quarry owner, of Queensbury, was recently charged before the West Riding magistrates, at Halifax, with having committed a breach of the by-laws of the Queensbury District Council. Defendant, it was shown, had erected piggeries, &c., in connection with property belonging to him in Long Lane without previously submitting plans to the Council for their approval. He was warned when preparing the foundations that the submission of plans was required under the by-laws. His excuse to the Bench was that, even if he had sent in plans, the by-laws gave the District Council no option but to sanction them. The magistrates imposed the full penalty of £5 and the costs.

New Patents.

These patents are open to opposition until March 30th.

1900.—**Smoke-Consuming Stoves.**—4,686. H. Perfett, 20 Fitzroy Street, Ipswich. The main draught is arranged to be taken from the lower part of the fuel, which is consequently highly heated, while the air and smoke from the top of the fuel are drawn down to a point where they meet the flames below; here the smoke is consumed.

Glue Manufacture.—17,966. L. L. Kelsey, Guildford, New Haven, Connecticut, U.S.A. By this invention a mass of hot liquid stock is reduced under pressure to a plastic state, and then formed into pencil-like strips, which are afterwards dried. It is claimed that with these strips the glue can be made ready very quickly, and there is no chance of "caking."

Window Blinds.—19,214. C. A. Baker and J. E. Darby, both of Wankesha, Wisconsin, U.S.A. The main feature of this invention is that the blind is provided with ball bearings, so that it may work more easily and rapidly.

Casement Hinges.—19,733. F. T. Wonnacott, St. Helens, Monmouth Road, North End, Portsmouth. The hinge consists of two parts—an ordinary strap hinge having at the end nearest the centre of the window a flap or half hinge. Ordinarily the casement is held by a thumb screw, but when this is unfastened the casement is free to turn on its centre hinge—for cleansing purposes.

Sawing Machines. — 29,045. R. Logan, Worsley, Western Australia, and J. C. Port, Adelaide Terrace, Perth, Western Australia. This machine is specially applicable for cutting blocks for wood paving. On a cylinder driven by power sections of saw-teeth are fixed at given intervals. In this manner cuts of a certain depth and length can be made while the material is being fed continuously forward.

The following specifications were published on Saturday last, and are open to opposition until April 6th. A summary of the more important of them will be given next week.

1899.—21,829, Wilkinson, brick dies.

1900.—2,420, Ridgway, self-flushing time-valve for sewage distribution. 4,498, Barr, pipe couplings. 4,736, Arzt, gas for illuminating and heating purposes. 4,825, Wilson, saw teeth for cutting wood or other materials. 5,421, Budden, means for consuming smoke in fireplaces or furnaces. 5,448, Bartl, dampers for the chimneys of private houses. 5,992, Smith, filters. 6,013, Norris and Ball, ventilators for drains. 8,048, Grode, manufacture of balusters, pillars, &c. 17,230, Tait, water-filtering apparatus. 17,826, Tubbs, window sashes and frames. 19,484, Wills, expansion joint for connecting ware and metal pipes. 22,043, Riggs, nut-tapping machines. 22,151, Elrick, curved junction-eye for clay and metal pipes. 22,226, Berthold, automatic gas-lighters. 22,897, Wehner, Maltner and Bansen, stop valves. 23,021, Noakes, telescopic elevators. 23,211, Fireproof Partition Syndicate, Ltd., and Cammell, fireproof partitions having a metallic framework. 23,879, von dem Borne and von Debschütz, manufacture of polychrome ware.

Keystones.

A new Theatre for Hammersmith is to be erected shortly on a site at the corner of Rowan Road, close to Hammersmith Broadway.

Mr. G. A. W. Reeve-Reeve, architect and surveyor, of 27 Allens Road, Southsea, has opened additional offices at the Albert Hall Chambers, Portsmouth.

Mr. Charles Herbert Shoppee, F.R.I.B.A., F.S.I., the eldest son of the late Mr. C. J. Shoppee, of 41 Mecklenburgh Square, W.C., was married to Miss Jemima Fountain, the daughter of the late Mr. William Fountain, of Leicester, recently.

A new Hospital for Southport.—A Local Government Board enquiry was held last week into an application by the Southport Corporation to compulsorily acquire about ten acres of land in the parish of Scarisbrick for the erection of an infectious diseases hospital.

The new Church of St. Luke's, Thornaby, is to be erected complete, instead of only a portion being completed first. The first contract was for £4,656, but the decision to complete the whole building will entail an extra cost of £2,000, making the total cost nearly £7,000.

A Memorial Portrait of the late Sir Charles Hall, who represented Holborn in Parliament from 1892 to 1900, and who was the Recorder of the City at the time of his death, has been placed in the Holborn Town Hall, W.C. The painting was executed by the Hon. John Collier.

Harrogate Improvements.—A Local Government Board enquiry was held last week into the application of the Corporation of Harrogate for sanction to borrow £49,000 for a kursaal to be built on the Spa Estate, for the purchase of the Starbeck baths and springs, and for other purposes.

In the Parish Church of Egloshayle a memorial to the late Professor H. Shuttleworth, of St. Nicholas Cole Abbey, London, who died in October last, has been erected. An urn containing the cremated ashes of his remains has been placed under a memorial tablet sculptured by Mr. Harry Hems, of Exeter, in the north wall of the church.

A Discovery made recently in Aldgate High Street of what is believed to be the foundation of the two towers on this particular entrance in Old London Wall will probably lead to some further archæological finds. The original gate was taken down in 1606, and its successor was still standing in 1761, although not long after it was privately purchased and re-erected in Bethnal Green.

Corston Parish Church has been restored. The work carried out consists in the enlargements of the chancel, the conversion of the high-backed pews to a more modern style, the cleaning of the interior of the church, and the commencement of the erection of a north aisle, the eastern portion of which had only been done. The work was carried out by Messrs. Downing and Rudman, of Chippenham.

Hyde Park Place, a line of some twenty century-old houses stretching from Stanhope Street, Bayswater Road, to Albion Street, and facing Hyde Park, is now being demolished. The spot is just beyond the Marble Arch and Connaught Place, and is chiefly distinguished by the appearance in its midst of a Chapel-of-Ease of St. George's, Hanover Square, built eight years ago on the site of the old Mortuary Chapel of the St. George's Burial Ground.

The Royal Academy Exhibition, 1901.—The receiving days for intended exhibits this year will be as follows:—Water-colours, miniatures, black and white drawings, engravings, etchings, architectural drawings, and all other works under glass, Friday, March 29th; oil paintings, Saturday, March 30th, and Monday, April 1st; sculpture, Tuesday, April 2nd. Works will only be received at the Burlington Gardens entrance. Hours for the reception of works 7 A.M. to 10 P.M. Forms and labels can be obtained from the Academy during the month of March on receipt of a stamped and directed envelope.

A new Town Hall for Newcastle is proposed to be erected. The committee of the Corporation appointed to consider the question have recommended the Council to secure the Singleton House site for such a purpose.

A Leeds Competition.—Mr. Leonard Stokes (of London), the assessor appointed by the Leeds Corporation in the competition for a Branch Free Library in Nineveh Road, Leeds, has awarded the first premium to Mr. William Bakewell, F.R.I.B.A., of 38 Park Square, Leeds.

Turkish Baths for Carlisle.—Mr. C. B. Newton, manager of the Carlisle Gas- and Water-works, has prepared plans, which have been approved by the Town Council, for the provision of Turkish baths at the Corporation Baths. The new baths will cost about £2,000, and provide accommodation for about a dozen persons.

The Collegiate Church of St. Saviour—the cathedral-designate of the future diocese—is to be restored, and a collegiate house erected. For the former purpose a sum of £6,000 is required. £300 of this is for the repair of the tower, and other exterior and interior work is equally needed. For the purchase of a site and the erection of a choir-vestry the sum of £3,000 is required and a sum of £4,000 for the erection of the collegiate house.

London Matriculation Directory, 1901.—We have received a copy of this book from the University Correspondence College Press. It gives full particulars about the curriculum and the examinations, and is of considerable help to students. We note that one out of every six persons matriculating at London University is a student of University Correspondence College. The Directory may be obtained at 32 Red Lion Square, Holborn, W.C., price 1s. nett.

A new Church at Kirkcaldy has been erected in place of the old Dunnikier United Free Church. The site, however, has been changed somewhat to suit the movements of population, and the new building has an elevated position close to the railway, where it will serve the newer part of the town. It was designed by Mr. John B. Wilson, Glasgow, in Scottish Gothic style of the late decorated period. A feature is the decoration, which has been carried out in low harmonious tones of colour, enriched by bands of ornament on the walls, and contrasting well with the grey stonework of the interior, and the soft green staining of the seating. The church is fitted for electric light. It is seated for 740, and has a hall for 260 attached, with session-room, vestry, cloakroom, &c.

A Large Building Project in Newcastle.—A block for the erection of new buildings in the Side and Dean Street have been approved. The new buildings will cover the whole of the land now occupied by old property at the head of the Side, and the large corner block at the junction of Dean Street and the Side, and extending up Dean Street to the new offices of the Manchester Fire Assurance Company. In addition to this, a large portion of the property facing the Cathedral behind Amen Corner has been purchased. It is the intention of the new owners to erect a palatial block of offices, &c., the area of which will cover about an acre. Messrs. Marshall and Tweedy are the architects for this important building project. The cost of the whole of the undertaking is estimated to be between £200,000 and £250,000.

The Parish Church of Wrexham, dating from the 15th century, is popularly known as one of the seven wonders of Wales, and its tower is by competent authorities considered one of the finest examples of perpendicular architecture in the United Kingdom. Although during the last 30 years large sums of money have been spent upon the fabric, Messrs. Prothero and Phillott, of Cheltenham, the well-known architects, have reported that the tower and external structure of the church require immediate and careful reparation. The cost of such reparation will amount to £9,000, and the reparation of the two uppermost tiers of the tower and of the roof and clerestory windows is now being proceeded with at a cost of nearly £4,000. Mr. Thompson, of Peterborough, is the builder.

Mgr. Avon, Bishop of Guadeloupe, who was the author of archæological and other works, died last week at the age of 53 years.

Church Gresley Church.—The parish church committee, appointed to report upon the present condition of the fabric, restored in 1786 and 1872, have decided to thoroughly repair and renovate the ancient edifice, and to build a new church. The site is at the extreme limit of the parish, between Landsdowne and Wilmot roads, and when completed will provide church accommodation for the new adjoining populous areas of Gresley and Swadlincote.

Stockport Workhouse Scheme: the Architect's Charges.—At a recent meeting of the Stockport Board of Guardians, the report of the committee appointed to consider the account of Mr. Ward, architect, for the preparation of plans of the proposed new workhouse at Stepping Hill was adopted, after some discussion. The arrangement come to is that Mr. Ward accepts the further sum of £1,750 in settlement of his account to date, and in the event of the Guardians instructing him to carry out the scheme as approved by the Local Government Board he will be prepared to fulfil his original engagement to finish the work and receive the balance, plus anything else that might accrue, in full settlement for his services.

The New Art Gallery in Whitechapel is to be opened on March 12th, and a large number of valuable and interesting works have been promised for the loan collection to be exhibited there. The collection will be particularly rich in works by Ford Madox Brown, including "Don Juan and Haidée," "Cromwell, Milton and Marvel," "The Traveller," "Cromwell on his Farm," and the portrait of Professor and Mrs. Fawcett. Millais will be represented by "The Carpenter's Shop." Valuable portraits by Vandyke and Lely and a group of Canaletto's Views of London have been offered; but it is uncertain whether the authorities of the gallery can afford the necessary insurance unless they are enabled to do so by further offers of financial assistance.

Glasgow Royal Infirmary Competition.—Dr R. Rowand Anderson writes to the "Glasgow Evening News" with reference to an interview with Sir David Richmond, published in its columns:—"In that article Sir David Richmond is reported to have said, 'We engaged Dr. Rowand Anderson as technical adviser—not assessor.' My appointment, taken from the minutes of the meeting of the committee on plans for the reconstruction of the Glasgow Royal Infirmary, dated 7th March, 1900, is in the following terms:—'The sub-committee thereupon agreed to appoint, and hereby appoint, Dr. Anderson assessor to the committee.' In the printed terms and conditions of competition issued to architects it is stated that the committee will 'appoint a neutral architect of standing as assessor, and will give the fullest consideration to his advice.'"

St. Lawrence's Church, Wymington, described by Freeman as that exquisite "Decorated" church, is to be repaired. Erected in the fourteenth century by John Curteys, Mayor of the Woolstaple at Calais, the building has escaped serious interference from restorers and repairers, but it seems the time has come when important measures must be taken to prevent the sacred edifice from falling into hopeless decay. Mr. Charles Blomfield has prepared a report on the condition of the building, and has made suggestions in a conservative spirit, which it [illegible] expected will be adopted. For the present the roof and walls require most attention, and other necessary improvements may be postponed. The tower and spire are especially noticeable, and the east end is flanked by octagonal turrets capped by heavy battlements. There is much elaborate tracery in tower and spire, and numberless allusions in stone to the woolstapler's industry. Between nave and chancel there is no external mark of separation, but there are chapels north and south dedicated to St. John and the Blessed Virgin. Under a beautiful ogee arch between the chancel and the south chapel is an altar-tomb of the founder and his wife, and in various parts of the church are many very fine brasses. There is also some excellent carved oak.

CONTRACTS OPEN.

TO BUILDERS.

The METROPOLITAN ASYLUMS BOARD invite TENDERS for the ERECTION of a SCHOOL at BRENTWOOD, Essex, according to drawings, conditions, and specifications, and Articles of Agreement, which may be seen at the Office of the Architects (Messrs. C. & W. HENMAN), 64 Cannon Street, E.C., between TEN and FIVE on and after WEDNESDAY, the 27th instant.

Bills of quantities, prepared by Mr. BERNARD SWINSTEAD, may be obtained at the Office of the Architects, upon payment of a deposit of £10 in gold or Bank of England notes, which amount will be returned to persons sending in a bonâ-fide Tender.

Tenders, sealed and endorsed "Tender High Wood School," and accompanied by original priced bills of quantities in separate sealed packets, must be sent to The Clerk, Metropolitan Asylums Board, Embankment, E.C., not later than TEN a.m. on WEDNESDAY, MARCH 20th.

The Board do not bind themselves to accept the lowest or any Tender.

By order,
T. DUNCOMBE MANN,
Clerk to the Board.

February 22nd, 1901.

COUNTY BOROUGH OF WEST HAM.

TO CONTRACTORS.

The Council hereby invite TENDERS for the ERECTION of a DYNAMO HOUSE at their Small-pox Hospital, Dagenham, Essex.

Plans and specification may be seen, and form of Tender, bills of quantities, and further particulars obtained at the Borough Engineer's Office, Town Hall, West Ham, E., upon the deposit of One Pound, which will be returned upon the receipt of a bonâ-fide Tender.

Tenders, endorsed "Tender for Dynamo House, Dagenham," to be sent to my Office not later than FOUR o'clock on TUESDAY, 12th MARCH, 1901.

The Council do not bind themselves to accept the lowest or any Tender. The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the workmen's trade unions, and shall not assign, nor under-let, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,
FRED. E. HILLEARY,
Town Clerk.

Town Hall,
West Ham, E.,
February 1901.

BOROUGH OF PADDINGTON.

PUBLIC UNDERGROUND CONVENIENCE FOR BOTH SEXES.

TO CONTRACTORS AND BUILDERS.

The Borough Council of this Borough are prepared to receive TENDERS from parties willing to contract for the ERECTION and COMPLETION of a Public UNDERGROUND CONVENIENCE for both sexes at the junction of Edgware Road and Harrow Road, together with the works incidental thereto.

Conditions, specifications, bills of quantities, and plans may be obtained at the Surveyor's Department, Town Hall, Paddington, between the hours of TEN and FOUR (Saturdays, TEN and ONE p.m.) on payment of a deposit of £1 which will be returned on the receipt of a bonâ-fide Tender.

The Tenders must be sent, sealed and endorsed "Tenders for Underground Convenience," and directed to the Town Clerk, Town Hall, Paddington, and left at the Town Hall on or before TWELVE noon on MONDAY, the 4th of MARCH, 1901.

At the same time a £10 Bank of England note (not to be enclosed with the Tender) must be lodged with the Town Clerk as evidence that the Tender is made bonâ fide the same to be returned immediately to parties whose Tenders are rejected, but in the case of the party whose Tender is accepted to be retained until the contract is signed. If the Tender be withdrawn after its acceptance by the Council the deposit will become forfeited.

The party whose Tender may be accepted will be required to provide two sureties for the due performance of the works.

The Council do not bind themselves to accept the lowest or any Tender.

By order,
FRANK DETHRIDGE,
Town Clerk.

Town Hall, Paddington,
London, W.,

Keystones.

A Valuable Slate Quarry has been discovered on the Cappard estate, County Galway, on the property of Major Galbraith, J.P. A company is to be formed for the purpose of working it early next year. This will be a great boon to the poor people of the neighbourhood, and will serve as a source of permanent employment for the cottiers, whose life is a struggling existence on the bleak Echtge Hills, which separate that part of the Shannon valley in the County Galway, in the Woodford direction, from the Plain of Aidhus.

A Rhenish Tour.—Last week Mr. Charles Cole gave a lecture to the Devon and Exeter Architectural Society, Mr. C. J. Tait, president, being in the chair. Mr. Cole took his audience from Harwich to the Hook of Holland, thence viâ Rotterdam, Nymingen, and Cranigen—the German frontier station—and so on to Cologne; thence in the Rhine Valley to Remagen. Coblentz and the fortresses of Ehrenheitstein were then dealt with. At Cologne the well-known bridge of boats and Cologne Cathedral were described. The seven mountains, including the far-famed Drackenfel at Königswinter, were next illustrated. A trip up the valley of the Ahr, with sketches of the picturesque Bunte Kuh, and the villages of Ahrweiler, Walpouzheim, Marienthal, Dernan, Rech, Maysshoss to Altenahr, were shown on the screen, and the curious wayside shrines described. Bonn, the birthplace of Beethoven, followed, and views were shown of the house in which the master was born, as well as others of the Münster Church, with the twelfth-century cloisters and the Market Place and Fountain Column, and the Alte Zou. The ancient town of Boppard was pictured next, with its handsome Ptarrkirsche, old Roman arch, and the Carmelite church, in which is a Christian tombstone of the seventh century, and some very fine fifteenth century carved stalls. The little village of Erpel across the Rhine, opposite Remagen, concluded the lecture.

London County Council.—At last week's meeting of the Council the Finance Committee recommended that they be authorised to take the necessary steps to ascertain the views of the Secretary of State for the Home Department on the following proposals:—(*a*) The extension of the sinking fund period for capital money raised for the erection of working-class dwellings; (*b*) the power to reckon the freehold land on which the dwellings are erected as an asset against debt. This was agreed to. Upon the recommendation of the General Purposes Committee it was resolved to appoint a new standing committee for the purpose of considering and reporting upon questions relating to historic buildings in London and of dealing with the preservation and publication of the historical records of the Council, the administration of the library, and other cognate matters. The Building Act Committee reported that they had received a letter from his Majesty's Office of Works with reference to the new offices for the Land Registry, Lincoln's Inn Fields, promising that the building line of the square should be, if possible, adhered to. This is very satisfactory from the public point of view, especially having regard to the exemption of Government buildings from the provisions of the London Building Act, 1894, and to the fact that it is not proposed to rebuild on the site of the existing one-storey buildings at the south-east corner of the Fields.

New Companies.

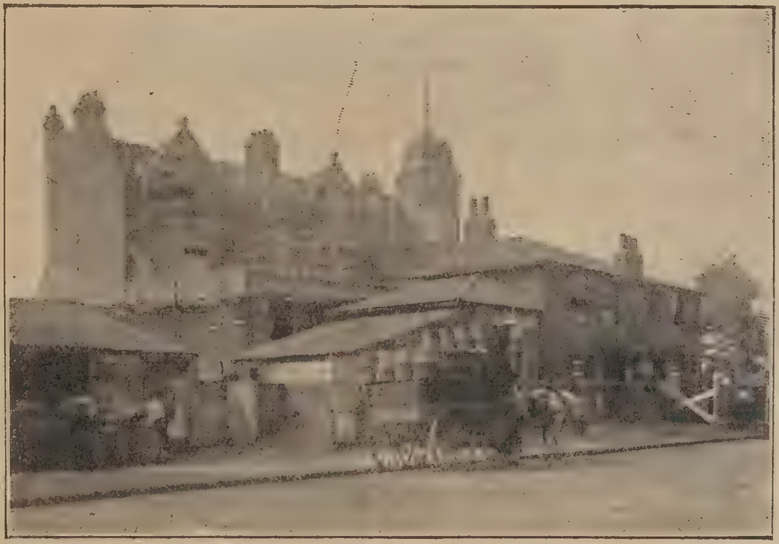
EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

An Architectural Causerie.

The New Chiswick. THE Four Miles Radius was long an insuperable barrier to the adequate extension of suburban London. Beyond the charmed circle of that number of miles from Charing Cross, where the roaring tide of London's life flows most strongly, one was plunged instantly into the provinces. The change was effected as though by the wand of the pantomime fairy. On the hither side of the fateful lamp-post one could claim to belong to the great world of the Metropolis, of politics, of fashion; on the outer side, one was a dweller in Suburbia. The matter of a single stride, the thickness of a party-wall, sufficed to effect this psychological change, and at the same time as it deprived one of self-respect and that of those who were fortunate enough to live nearer the hub of the universe by six inches or so, it sent up the prices of everything from a cab-fare to a cauliflower by at least fifty per cent. The Radius is now deprived of its terrors, for of late years tramways and other methods of communication have effected a change, and although the cabman still charges excruciating fares beyond the four-mile limit when he gets the chance, that chance but rarely comes to him now. With recent years, too, has come the building of flats in districts far beyond the radius—a thing thought impossible not so long ago, when it was an article of belief among builders and property owners that flats could not be made to pay at these distances. Peculiarly interesting in this connection is the growth of London along that western exit from it known as the Bath Road. Within the unstrained memory of the youngest of us, King Street, Hammersmith, was no sooner left behind than a modified rurality was reached at that part of the Bath Road which was, and is still, locally known as the Chiswick High Road. Chiswick never did lie upon this main artery, but may be sought, even yet very much of an old-world village, lying on the foreshore of the Thames, down a turning to the left. Turnham Green, on the main road, in the parish of Chiswick, has seen all the recent building, and by many of its residents who have a nice taste in addresses is dignified as Chiswick. Recent building operations here have disposed of the very last of the old market-gardens and fruitful orchards that bordered the way. The cause of this sudden development may be sought, firstly, in the all-night service of trams started two years ago, and secondly in the recent reconstruction of this line of the London United Tramways, which will give a service of electric trams from Hammersmith Broadway not only to Kew Bridge, but beyond that, through Brentford, to the very western end of Hounslow itself. The value of land has gone up immensely in this district in consequence of the cheaper and speedier communications thus ensured. A sign of the times here is the proximate completion of an extensive block of flats at Hamlet Gardens, on the site of Hamlet House, a deserted old mansion standing until quite recently in large grounds which could neither be let nor sold for a period of about twenty years past, during all which time a succession of the usual house and estate agents' huge black notice-boards appeared and flourished awhile and rotted away. We grew up from boyhood to maturity in this while, and thought to find the play outlast our time and the place at last gather such myths and eerie legends as most do affect such derelict old mansions. But one day the last of the boards disappeared; the enclosing high brick wall came down, the trees followed, and after that the house itself; and now, behold, flats apoplectically red, towering to the skies! Across the road, too, a little to the westward, there stood, until recently, an old roadside inn that knew the time when not a house save farmsteads (and of those but one or two) were in sight. An ugly, old, but not ancient, inn; a typical beerhouse, this "Coach and Horses," where the waggoners, jogging their three-miles-an-hour gait between the Middlesex market gardens and Covent Garden Market halted to refresh on beer and bread and cheese. Such a market waggon you actually see in the accompanying photograph of the house—a view taken the very day before the last of it was demolished to give place to the gorgeous red-brick and terra-cotta modern "Coach and Horses" seen rising behind. The view is interesting—nay, unique, for it shows us at one glance what old and new in this order of things are like. No longer will the waggoners halt their weary teams here, for the customers of the new house will be the residents of the new streets of villas that are springing up on the cabbage fields round the corner; and the two classes of trade—we have it on authority—do not mix. This, then, is the last of that old Chiswick which bordered the highway, and the disappearance of rurality so far as Kew and Brentford.



THE COACH AND HORSES, CHISWICK ROAD.

Our Squares. IT is only in very recent times that we have learnt to appreciate our squares. As London spreads no new ones are laid out; the appellation "Gardens" is freely applied where no gardens exist, whilst in blocks of "Mansions" all idea of square or garden is frankly abandoned. The historian of London at some future day will marvel at the culpable neglect of the people of the greatest city in the world who could thus allow vast neighbourhoods to spring up without the air, light and greenery of the older system. It is rare in English society to hear architecture mentioned: the rising middle class looks upon one square as fashionable and another as vulgar for social reasons alone without reference to taste, and the masses care for none of these things. Next to her parks and her river, her squares should be London's most cherished possession. Think of the number and extent of them; add up their acreage and see what "lungs" they are to the town, what a refreshment to the eye, what a comfort to the mind after the crowded streets; surely they merit the attention of all who are interested in the imperial city. The long succession of squares beginning near Gray's Inn Road and ending at Bayswater was commenced in the last century. Built of brick, comfortable, homely, seldom ill-proportioned, they are representative of the middle class—but they are destitute of fine buildings, striking effects, or picturesque designs. The familiar London brickwork has changed with time from staring yellow to dingy brown and grimy black; the slight relief given by small Palladian details has shared the same fate; monotony is a fault common to them all. Nearer our own time the brick fronts gave place to stucco in one uniform tint; the effect was to intensify the monotony, but when varied with tasteful colours, as was done more recently still, the results were very satisfactory. On the whole, however, our squares exhibit a remarkable want of public spirit and of artistic taste; a committee in each square charged to negotiate with the ground landlord and supervise all questions of taste and decoration would have been, nay would even now be, quite feasible, and greatly add to the amenities of London. A still greater change is the re-introduction of red brick as a building material; greater still is the revival of gables and fanciful roof treatment; greatest of all the increased height of modern buildings. The new style has burst upon quiet neighbourhoods in Bloomsbury and Marylebone with a most disturbing effect, and one of the new designs is enough to break the architectural peace of a whole square. It remains to be seen if the artistic effect will be satisfactory; at present we live in a state of change, but the danger of architectural failure must always be present if there be no "courtesy of architecture," no consideration for neighbouring designs, no restraint in height, material, or colour. If our squares are in danger of passing from the extreme of placid monotony in design to that of florid restlessness—not even St. James's Square or Hanover Square being spared—one feature at least remains sacred: the garden. No city can boast of such trees within its bounds, and the plane, it is well known, takes kindly to London; those in Berkeley Square are the most celebrated, but there are many more. Beautiful and restful as they are, the gardens exhibit the same monotony of treatment as the houses; one type prevails throughout, and the details, such as ironwork, gates, and the like, are usually poor; they seem to have been made by the mile. It is much to be regretted that no attempt has been made at formal or Italian gardening; that no central feature, no group of sculpture, no fountain, is found in them. There is a rather forlorn statue of one of the Dukes of Bedford somewhere in Bloomsbury, and others may be found by the diligent explorer, but the combination of the natural and the artificial, so common and so delightful a feature of Italian cities, is little understood in London.

THE SARACENIC ARCHITECTURE OF CAIRO.*

BY RONALD P. JONES, B.A.

IN the general group of Mahomedan styles, extending from India to the South of Spain, the Saracenic architecture of Egypt is in many respects the most important. Cairo, though not the residence of the Caliph, was, during the career of the Muslims in the Middle Ages, the centre of artistic development, and can show a series of mosques and monuments unequalled in number or beauty by those of any other city.

Again, the Cairene work may be considered the normal type: purer and more restrained than that of the other branches, and less affected by previous work at home or contemporary styles developing abroad. Cairo in itself has the additional advantage of including within its boundaries practically all the Saracenic architecture which still survives in Egypt, extending from the middle of the seventh century down to the end of the sixteenth, when it may be said to terminate altogether. As with mediæval Gothic, the finest work was produced in the thirteenth and fourteenth centuries.

The Arabs, on their conquest of Egypt, brought with them no style of their own to impose on the subject nation, and that which they found existing was a Coptic Christian copy of the Byzantine, borrowing largely, like its model, from the Roman remains. In detail, however, there was a certain amount of original work, such as carving, which followed the Byzantine method of drilling to obtain depth of shadow, and using the characteristic acanthus leaf with sharp points.

The first mosques were probably adapted from Christian basilicas, and in any case were designed by Coptic architects, so that more than two centuries elapsed before the Saracens freed their work entirely from Byzantine influence.

On the other hand, the ancient Egyptian architecture and its Græco-Roman revival, which had ceased with the introduction of Christianity, can hardly be said to have influenced the Mahomedans at all; and this is not surprising, for the sacred buildings of the two periods were so entirely different in form and character that it would not be easy to find any two types belonging to the same country which have so little in common; even this is due rather to climatic conditions than to any real connection between the styles.

The Egyptian temple, a threatening and impenetrable mass of wall and pylon, full of dark mysterious chambers accessible only to a chosen priesthood, built for eternity of the most durable materials in enormous masses, was not so much a house of prayer for the nation as a fortress within which the truth was jealously kept from common knowledge: while the Saracenic mosque was open in every part to the light of day, and free to all comers; constructed no more solidly than was necessary for the provision of shade and seclusion, a picturesque group of open courts and cool recesses, fantastic minarets and airy domes, all arranged with playful disregard for symmetry or dignity and decorated with a fascinating, if superficial, system of colour and mosaic, which told no mysterious and awe-inspiring story, but simply gave here and there patches of rich colour, charming to the eye and perfectly in harmony with the true character of the building itself.

To turn to some of the general features and influences of the style, first and foremost comes the climate. Cairo is practically rainless: not that it never rains at all, as in upper Egypt, but the rain is not frequent or continuous enough to be of importance; while the perfect dryness of the air and almost perpetual sunshine are certainly unknown in any other country which has developed a style of its own. The effect is felt in all branches of construction and decoration. In the first place the necessity for a roof as a protection from rain and bad weather hardly exists; but on the other hand protection from the sun is all important: there is hardly any part of a mosque which would not be devastated by a northern winter storm, and the most delicate woodwork and stucco relief is entirely exposed to the open air. The roof is flat and invisible from the ground externally, and it needs no gables, gutters, or gargoyles, or any of those expedients which the northern architect turns to such good account. The domes are reduced to incredibly thin shells of masonry which have no greater weight to bear than that of their own materials: carved and modelled work, so long as it was out of reach of human destruction, might be carried to extremes of fragility, and at first ornament which would naturally be carved in stone was executed in plaster.

The extraordinary brilliance of the sunlight led to the use of low relief, the depth of which hardly varies, whatever the material employed; while the sharp contrast of light and shade rendered undercutting unnecessary and delicate half-tones impossible. Colour abounds everywhere; not only the artificial colouring found in ancient work, but that of natural materials, which is one of the finest features of the style, and has been once for all described in a celebrated passage of the "Stones of Venice."

With regard to religious requirements, a mosque is not a church at all in the Western sense; it is merely an enclosure where the individual worshipper may find rest and shade. The simple services which take place only require a pulpit and a reading desk, while a niche in the wall shows the direction of Mecca, and a fountain in the court supplies water for the preliminary ablutions. There is no special sanctuary reserved for the priesthood, no music or singing, and no ritual of processions or sacrifices; consequently the furniture of a mosque is trifling compared with that of a cathedral, and its form once fixed remains permanent all through the life of the style.

An important religious point, however, exercised immense influence over the decorative arts—representation of man and animals in sculpture or painting was absolutely prohibited; and this commandment at one blow debarred the Saracenic artists from the widest field for their talents. They had to take refuge in abstract lines and curves; the more so since Egypt is almost entirely destitute of natural foliage which might have served as a model; As a result they produced a most ingenious and complicated system of interwoven lines, radiating and returning, which may be uninteresting compared with the sculpture of the West, but is suitable for the use of coloured materials and possesses a distinct charm of its own.

This geometrical system was applied to all materials indiscriminately, from stonework to carpets; though exceptions occur, such as friezes, where the running scroll with conventional leaves is found, often serving as a background for texts from the Koran, which in the beautiful Cufic or Arabic lettering are extremely effective.

The materials may next be shortly described, beginning with stone, which does not appear to have come into use for construction till the beginning of the fourteenth century; after that time most use was made of limestone, of which there is an inexhaustible supply in the hills to the east of Cairo, while the Pyramids themselves were even more convenient as a quarry, since the blocks of stone were there ready cut and only needed reducing to a manageable size and transporting across the Nile.

Granite is hardly ever found except in the form of old fragments, such as lintels from the temples, used as threshold stones for the inner courtyard of the mosque, and in many cases still showing their original hieroglyphics.

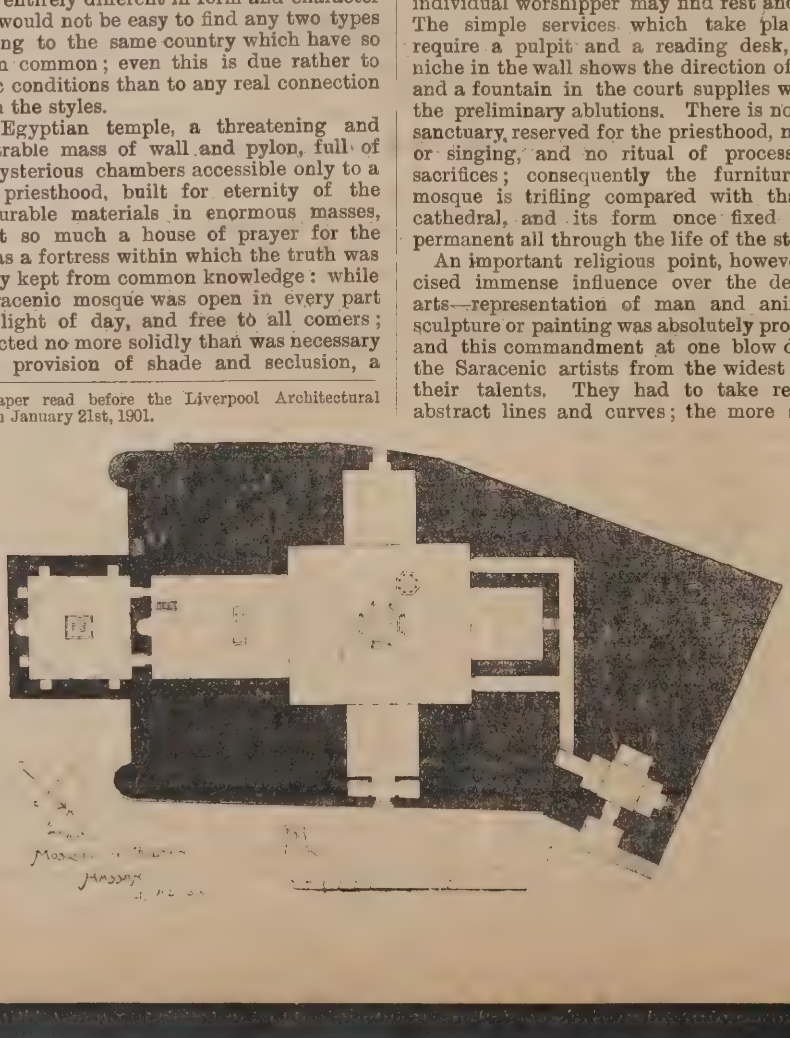
Marble as a constructional material is equally rare, and consists of columns borrowed from small Greek and Roman buildings, and used for the arcades in the early period of the style. But the supply seems to have given out very soon and did not lead to the formation of any Saracenic order, since the architects afterwards took to setting their arches on square piers. On the other hand, as a veneer marble is very important in all periods; whether cut in large slabs for dados, inlaid in pavements, or combined with other precious materials in mosaic, it is the chief decorative factor of the style and contributes a great deal of that natural colouring which is one of its best features.

A few varieties were quarried in the country, such as red porphyry, black diorite and greenstone; but all the rest were obtained from the Roman work at Alexandria, or from the Coptic churches, which in their turn had imported them from Greece, Italy and the whole civilised world.

The Saracenic brickwork resembles the Roman, from which it was no doubt copied, in the use of bricks not more than 2in. thick with very wide mortar joints. Like Roman work, too, it was never meant to be visible, but always covered with plaster, laid on in several coats of some thickness, and if decoratively treated, modelled by hand while still damp; this method of treating the stucco gives it the proper freedom of line and artistic effect which is not to be found in the mechanical moulded work of the south of Spain.

The Cairo mosques contain a remarkable amount of woodwork, considering that Egypt grew no trees at all except the palm, which seldom attained a size large enough for roofing beams; practically all timber had to be imported—sycamore and cedar from Syria, and pitch pine from Asia Minor, these being the varieties mainly used.

Again, the effect of the climate on large carpentry was bad; certainly there was no fear of damp and its consequences, but the fierce dry heat sooner or later warped the wood and made it brittle. The only remedy for this was to adopt a system of minute subdivision into panels so that the shrinkage in each particular piece should not affect the whole too seriously. The system was not very practicable in the case of roofs of some span except as coffering, which is sometimes found; consequently most of the original roofs have long ago collapsed. But with joinery and cabinet work it was carried out most thoroughly, and it is curious to note that the necessities of the climate pointed to exactly the same method of treating woodwork as did the Saracenic scheme of decoration imposed by a religious prohibition. Variety of colouring could be obtained by the use of cedar, sycamore and ebony, which were often combined with small plaques of ivory and mother-of-pearl.



---

* A paper read before the Liverpool Architectural Society on January 21st, 1901.

Leaving glass to be considered with windows, the other minor materials are chiefly decorative, such as tiles, enamel, and tortoise-shell, used with marble for mosaics. Bronze and iron are the only metals which commonly occur, being used for overlaying doors, when they are themselves sometimes inlaid with discs of silver embossed in relief.

In respect to plan and general proportions, the mosques fall into two main classes—that of the square cloistered court, and that of the cruciform building with an open court in the centre. Some examples of a third type are found following the Byzantine model with a central dome; but they are not important enough to be regarded as anything more than exceptions.

The original mosque of Mahomet at Mecca consisted of a simple enclosure of brick partly roofed with beams supported on wooden columns, and up to the thirteenth century the cloistered mosque derived from it continues to be the only type. Round three sides of the courtyard ran a single or double arcade, while on the east side (in reality south-east, the direction of Mecca from Cairo) the number was increased to five or six, in order to provide more shade where the congregation gathered.

In the earliest examples the arcades run north and south on all sides, so that in the east and west walks the arches are transverse; but this arrangement was soon given up in favour of the other and more usual plan.

The general proportions were low, since the court was of great size and the arcades had to be kept down to obtain as much shade as possible throughout the day; consequently the exterior elevation was barely higher than the adjoining houses and was treated simply as a blank wall, with the exception of the entrance, which was always a prominent feature in the mosque.

The second type prevailed during the period of the best work, and is much more compact and effective considered as a whole. The central court is smaller on plan and of nearly cubical dimensions, and from each side there extend arched openings, that in the eastern wall being the largest, as containing the niche and pulpit; but the plan is so far cruciform and symmetrical. The proportions of height to width were much more equal than in the earlier class, and the exterior called for more careful treatment. Unfortunately the good effect of the plan was entirely lost externally, owing to the habit of filling in the angles with small passages, staircases and rooms in several storeys, which had no particular object and brought the exterior elevation to that of a simple rectangle, the walls of which are pierced with tiers of small windows arranged without regularity and giving no indications of the interior arrangements. The cruciform mosque has therefore none of that close and logical connection between interior and exterior which is characteristic of the best Gothic work; and considered architecturally it suffers accordingly.

At the same time it must be admitted that symmetry and dignity were not the aims of the Saracenic architects, who possibly preferred that their buildings, which were usually of small size, should attract by picturesque and informal grouping of the various parts; and this was the more desirable since the principal feature of the style—the dome—could not be made to form the central point of a symmetrical group.

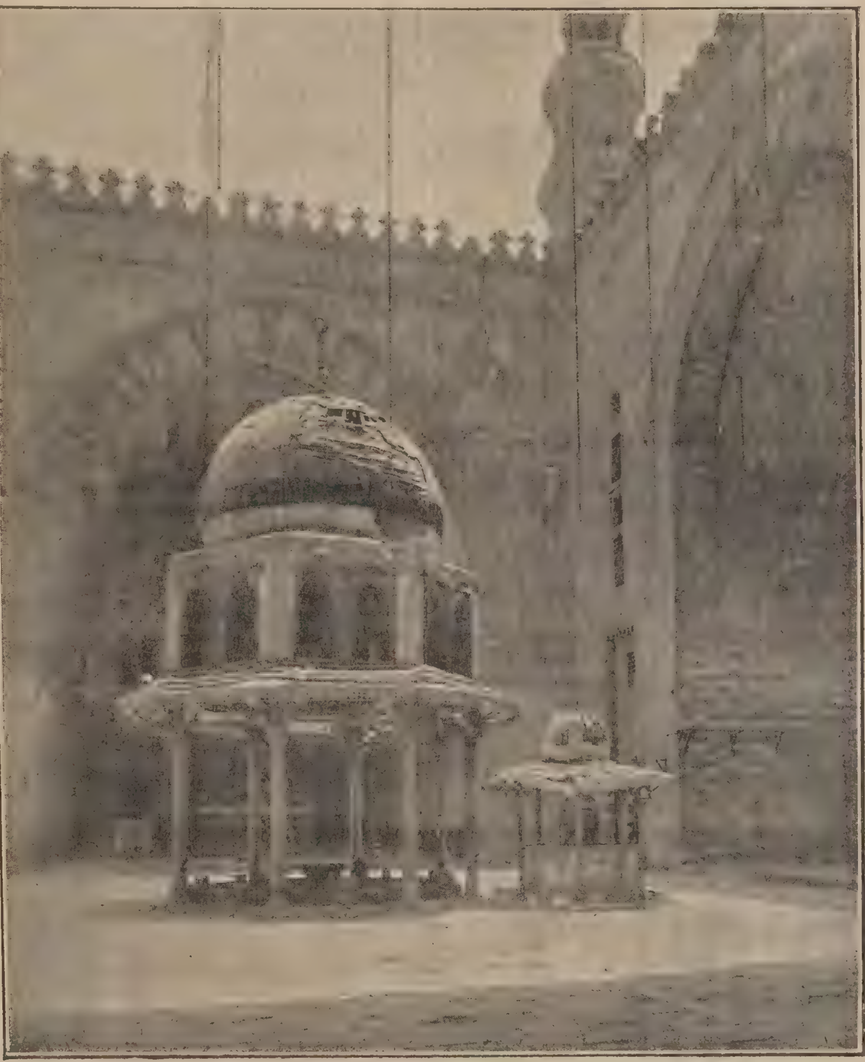
The dome, in itself, has no connection with the mosque, as it is only used to cover the tomb-chapel, or mausoleum of the founder: many of the early mosques have no dome at all, and its presence in later times is only due to the custom which came in that each building should have some member of the founder's family buried by it.

Not only was the dome cut off from the mosque itself, but the tomb-chapel was not generally placed on the centre line, but in some convenient position on one side of the eastern arm; which necessarily gave the exterior a lop-sided appearance.

Other opportunities for effect were lost by the fact that the interior of the dome was only visible from the chapel directly below it, and the proportion of height to width was sometimes more than three to one—much too great for comfort or good effect.

The minarets on their part did not help matters externally. Each mosque had one or two, the position of which was undecided; they might be at any angle and need not necessarily be on the building at all, since a pair of them belonging to one of the late cloistered mosques are placed over a large gate in the city wall, which happens to be near at hand. The main entrance again is found at any odd corner, and never by any chance in the centre of the western side.

The constructional details of the two types may be considered together since they only vary in so far as different materials were in common use at different periods. In the absence of a complete Saracenic order the arch is the feature which first claims attention; the original form was naturally semicircular, since the Romans and Copts used no other.



MOSQUE OF SULTAN HASSAN, CAIRO: INTERIOR.

But as early as the ninth century a very beautiful form of pointed arch was introduced, which consequently antedates by about three centuries the first of its kind in Europe. The Mahomedan architects, unlike their European rivals, do not seem to have been driven to the pointed form by any necessity of construction; it can only be supposed that they knew of both kinds, and preferred the pointed from a decorative standpoint.

In the early examples the arch is somewhat obtuse and has a slight return at the springing, giving an indication of the horseshoe form which afterwards became much exaggerated in other countries. The typical Saracenic arch is the stilted equilateral or four-centred, as the pure Gothic form with centres on the springing-line is not common. Small arches sometimes have trefoil heads, or are otherwise decoratively treated.

In one point all these arches differ from those of the western mediæval work: the voussoirs are invariably square in section, with a flat soffit: mouldings on them are entirely unknown. During the Crusades, the Arabs became familiar with the forms of European architecture prevalent at the time, but for several reasons they kept to their square section. In the first place mouldings were out of place in a country of brilliant, almost harsh, light and shade. Secondly, the square pier which at an early date replaced the circular column did not lend itself to an arch section of curved form. Having decided to reject the moulding system, which emphasised the continuity of the curve, the Saracens took the opposite course of laying stress upon the division into voussoirs by painting every alternate one red. This custom, in its turn, compelled the use of a keystone, in order to obtain symmetry in the colour decoration; and here again the Arabs differ from the Europeans, who always regarded the pointed arch as two segments meeting at the apex without a keystone. In fact, it is interesting to notice in how many respects the Cairene and Gothic arches contradict each other.

That which is commonly spoken of as a Saracenic arch—the true horseshoe form—is not often found in Cairo, as before noted, except in small buildings, where it is inoffensive, though naturally always bad constructively, since the returning segments at the springing are useless and have to be supported by a useless projection in the pier below.

The early arcades, as in Byzantine work, were supported on columns, invariably borrowed from older buildings and roughly brought to the right length, sometimes by the addition of an inverted capital used as a base; dosserets were used over the capital, and also wooden tie-beams, the purpose of which does not seem to have been really understood, as they are often used in parts of an arcade where there is no outward thrust not counteracted by the adjoining arches. The first original form of pier to be evolved was one of square plan, with attached shafts in the angles, of the same material as the pier itself, namely, plastered brick. But this was only a transition to the plain square, which in time became as universal as the corresponding arch.

There is no very marked division between the pier and its arch, like the Gothic capital; but occasionally a band of carving or stucco relief is carried round under the springing.

With regard to vaults, the Saracens were familiar with all forms of barrel vaulting; the first cloistered mosques had flat wooden ceilings, which are always unsatisfactory in appearance, since there is no masonry connecting the parallel arcades, as there are no transverse arches.

Vaulting, however, soon came into use for passages, where it is usually of pointed section, and may be of plastered brickwork or carefully-jointed masonry; as the style developed very large spaces came to be covered by this pointed barrel vaulting. Domical vaulting, as might be expected, is very common, and takes the place of the Gothic intersecting vault. The finest examples are to be found in the two city gates, which are in the shape of low square towers covered by what is practically the original type of dome on pendentives, slightly flattened in section. The normal Saracenic dome of the best period invariably has a drum of some height, and in section appears to be a stilted three-centred arch of a shape which is not found in the West. It consists of a single shell of very thin masonry or brickwork without a lantern at the apex, and the drum is pierced with a ring of small windows with semicircular or pointed heads.

The brick domes are constructed in horizontal rings, overhanging as they rise, till they meet at the apex. They are plastered inside and out, in the latter case fluted or otherwise treated in relief. But in the later centuries they were of cut stone, with radiating joints in the true arch form, and their outer surface is enriched with fluting or carved geometrical patterns. The wonderful elaboration of these designs and the ingenious way in which they are adapted to a surface of peculiar form make these domes one of the most beautiful features of the style, though it is curious that they are not coloured in any way, and show no signs of having been so treated. Being only possible in a very dry climate, they derive additional interest from the fact that they are practically unique. The pendentive is a very important member of the style, as it occurs not only under domes, but for the purpose of filling up angles in various other positions. It is constructed like the Byzantine pendentive, but always decorated with a false and unconstructional system, which is often quoted as a happy invention of the Saracens, but is in reality one of their great blunders.

This is the stalactite or honeycomb carving, which always consists of the same form, repeated and combined in different ways. The single atom, so to speak, is a small pointed arch, curving forward at the apex and resting on two upright supports with a recess between them: these in their turn rest on nothing whatever; but below each one comes the apex of another arch, also curving away beneath it, and providing no kind of support, real or apparent.

To suit the pendentive form, the lowest point is a single arch, each row above it containing one more than the last, and overhanging it. Thus the series gradually spreads out and terminates under the drum. Of course, being carved in solid stone, the system has no constructional value, in which case it would obviously be impossible; but merely as a decorative design it is most objectionable, since it suggests a *tour de force*, especially when, as is often the case, the supports of the arch are treated as small columns with capitals, and sometimes are actually hung from the arch as pendants. It would hardly be fair, in dealing with a decorative and fanciful style, to expect logically decorated construction in all positions, but in a pendentive beneath a dome there should certainly be a suggestion of support in the method; whereas the Saracenic stalactites make the pendentive appear to hang from the dome and to have no more power of supporting it than a piece of tapestry let down to conceal an awkward corner. In fact, the masonry in some cases has been left plain, and the architect has perversely covered it with stalactites carved in wood, which have since partly or entirely collapsed and reveal the simple construction behind them.

Compared, for instance, with fan-tracery, where the lines of the ribs and liernes help to suggest the construction of the vault, though not actually supporting it, the inferiority of the Eastern system is apparent. And the same may be said of the Cairene cornices, which consist of tiers of stalactites, as in the pendentives, when compared with the bracket cornice of the Classical and Renaissance periods.

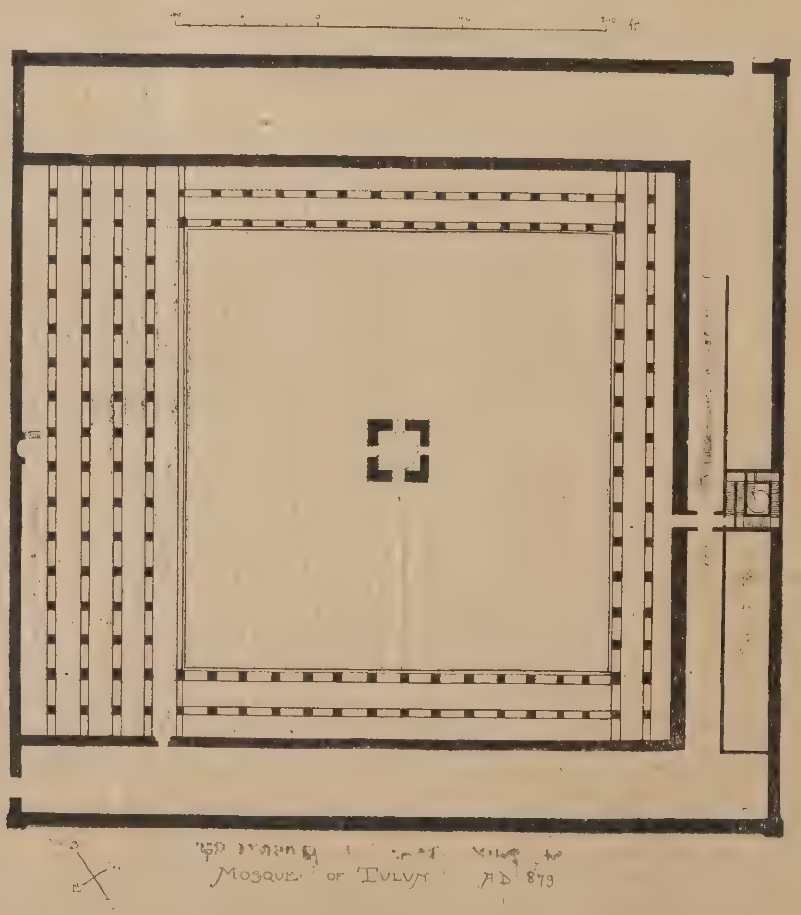
On the exterior of the dome the transition from the base of the drum to the square substructure was managed by cutting away the angles of the latter over the pendentives in the shape of steps which are sometimes enriched with large mouldings; by this means the square was brought to an octagon and could receive the circular drum direct. From a constructional point of view the most surprising fact about the mosques is the very slight resistance which can be offered to the dome's thrust. The substructure is generally isolated on three sides and has no buttresses of any kind, while the dome is raised on a drum of some height which brings its section to that of an extremely stilted Gothic arch, or something approaching it. The masonry of the dome is of extraordinary lightness, perhaps not more than 8in. or 9in.; but then so is that of the drum, where 18in. or so has been found solid enough to support a dome 30ft. or 40ft. in diameter. As seen in section, the dome could not stand a moment if it were an arch or a vault, and this fact is noted by Fergusson in dealing with the Indian domes, where the architect seems to be able to play with his construction in the most surprising way. Bearing in mind the English chapter-houses, with their central pier and elaborate buttresses, it is nothing less than a revelation to see the lightness and boldness of the Saracenic domes.

The principles of lighting may next be considered. In the cloistered mosque the windows were naturally of slight importance: every part of the building was open to the air and brilliantly lit through the arcades, so that no cross lighting from the outer walls was required; even in the cruciform mosque the central court provided ample light for the four recesses. Besides this, in a climate where light means heat, there is every reason for obtaining as much deep shade as possible, so that in Saracenic work there is no tendency to the large window-spaces of the Gothic styles, and as a general rule the window was introduced, not as a means of obtaining light, but as a particularly brilliant piece of wall decoration. The lights have square or arched heads, and may be used singly or grouped under a circular opening, in which case the arrangement recalls that of the Early English transition to plate tracery. Their position on the wall was restricted by no rules, except that they were always very high up. The eastern arm of the cruciform mosque uusually contained two or more lights grouped symmetrically above the prayer-niche, but the three other transepts, so to speak, being less ornately treated, were not bound to have any at all.

With the tomb-chapel beneath the dome the case is different. Any light which might enter had to pass through the windows, and here they are more numerous, though still small. A circle of them was set in the drum of the dome, and the walls, down to the level of the springing of the pendentives, were pierced with groups. Below this point, however, they were rarely placed, and the general effect of the mausoleum, where the stained glass still survives, is that of a cool and shadowy chapel, with its darkness partly dispelled far overhead by rings and patches of rich light, subdued yet gorgeous, like glowing jewels.

Instead of stone tracery the lights are filled with a sheet of stucco about an inch thick, in which, while still soft, small holes of irregular shape are cut, forming the pattern, of which the glass is the filling. There are certain types of design most commonly found, such as conventional trees or vases of flowers, and there is no great variety of these.

The glass itself is very crude and violent in colour—red, green, blue, yellow and purple, all



MOSQUE OF TULUN AD 879

of the harshest tones—but in small pieces, separated by the thick lines of the stucco and set at the right distance above the eye, the general effect is surprisingly rich and beautiful.

Some general principles of Saracenic decoration still remain to be considered. In the first place, the Arabs aimed at concentration of ornament with the relief of plain surfaces, except in the case of very small mosques, where it was possible to apply minute decoration to the whole of the internal wall-surface without producing an over-elaborate effect.

On the exterior the points to which attention was directed were the porch and the minarets, besides the dome, already noticed.

The former was, in the best period, always modelled on one example, and consisted of a high and narrow rectangular recess, rising almost to the cornice and terminating in stalactites, leading up to a small semi-dome. The door is of no great height, generally square-headed and surmounted by windows. Beautiful examples of attached columns, running friezes, and inlaid work are found on the three internal sides of these porches. The minaret was necessary for the summoning of the people to prayer from some commanding position where the voice of the mueddin could be heard at a distance, bells of every kind being strictly forbidden. It rises from the general level of the exterior as a square tower containing a winding staircase; the square changes to an octagon and again to a circle; balconies project at various heights, supported on stalactites, and the top storey consists of a ring of small columns, standing free, and crowned by a bulbous dome with a sharply-pointed apex.

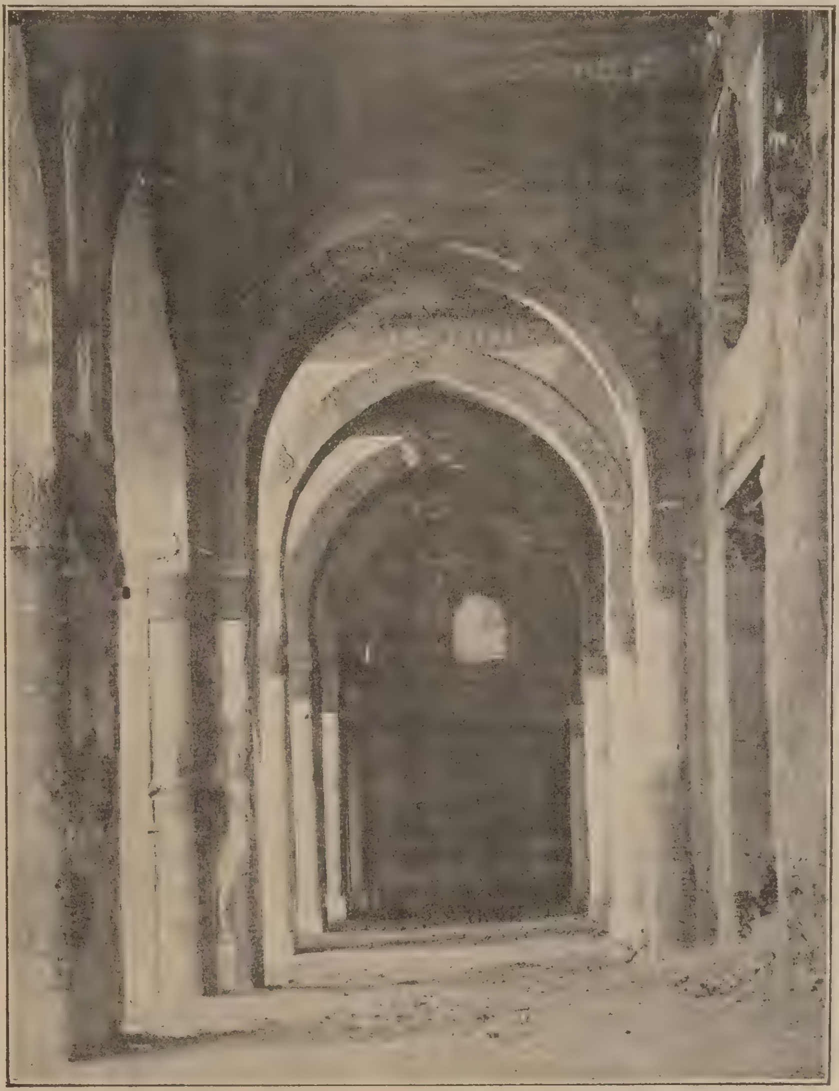
The whole surface is richly decorated with colour and relief, and in proportion and beauty of detail many of the Cairo minarets are worthy to be ranked with the Gothic spires and pinnacles, if their colour and delicacy may be held to compensate for the absence of the grandeur and solemnity of the Western work.

In the interior, decoration is lavished on the prayer-niche, which is always a beautiful piece of surface design elaborately treated with marble panelling, dwarf colonnades, mosaic and precious stones.

The arcades, if not vaulted, are covered with a flat wooden ceiling, in which the beams are square at the ends, but in the centre rounded and carved underneath; coffering is found, but nearly all the structural woodwork has had to be completely restored. The ubiquitous stalactites are used to mask the corners, and as brackets to support the beams. The pulpit may be of stone, but more commonly of wood, minutely panelled and subdivided: it is always set against the eastern wall, close to the prayer-niche, and has a flight of steps facing the court, so that the preacher simply ascends the stair and stands on the platform at the top, or rather on the top step but one, as a mark of deference to Mahomet himself, whose own position it would be presumptuous to occupy.

There were no choir-stalls or any other fittings which would offer scope for wood-carving, and perhaps the only remaining form of woodwork which calls for notice is the well-known mushrebîyeh lattice, formed of small turned pieces fitted together in geometrical patterns. It is mostly used in window openings of private houses, and, being restricted to very few forms, it is monotonous from a decorative point of view and of no particular interest.

There are said to be over 300 mosques in Cairo; but, like the Roman churches, it is not necessary to describe or even visit all of them; it will be enough to mention briefly the most notable examples of different kinds and periods. The starting point of the independent Saracenic style is the mosque of Tulun, the largest of the cloistered type. Before its erection marble columns, taken from earlier buildings, had been used with semicircular arches to form the arcades, as in that of Amru, outside the city. Ahmed Tulun's architect, however, undertook to build with new materials, and thereby saved numerous Coptic churches (he was himself a Coptic Christian), the destruction of which would have been necessary if marble columns were required. The work was begun in 876 A.D. and finished in two years, the material being plastered brickwork throughout. In plan the outer enclosing wall is 500ft. square and forms an outer court: the central court itself is 300ft. square, and is surrounded on three sides by double arcades, and on the fourth by five rows. The arches rest on square piers treated with attached shafts of the same material at their corners, and are the first known examples of the use of the pointed arch throughout a building, being somewhat obtuse in form, with a slight return at the springing. Between every pair of arches there is a niche-like opening, and the surface of the wall facing the court is decorated with large rosettes and terminated with a frieze of the same kind and a pierced cresting. Further decoration is on the arches and piers in the form of bands of carved stucco with a conventional foliage design, which shows none of the radiating form afterwards so common. Small windows are set in the outer wall, filled with beautiful pierced screens of geometrical pattern, and the roof is of date palm and sycamore, and has no decorative feature. There is a minaret with a unique external winding staircase. A certain massiveness distinguishes the mosque from other cloistered examples, and it contains no stalactites, and in fact very little characteristic Saracenic decoration at all.



INTERIOR OF ARCADE, MOSQUE OF TULUN, CAIRO.

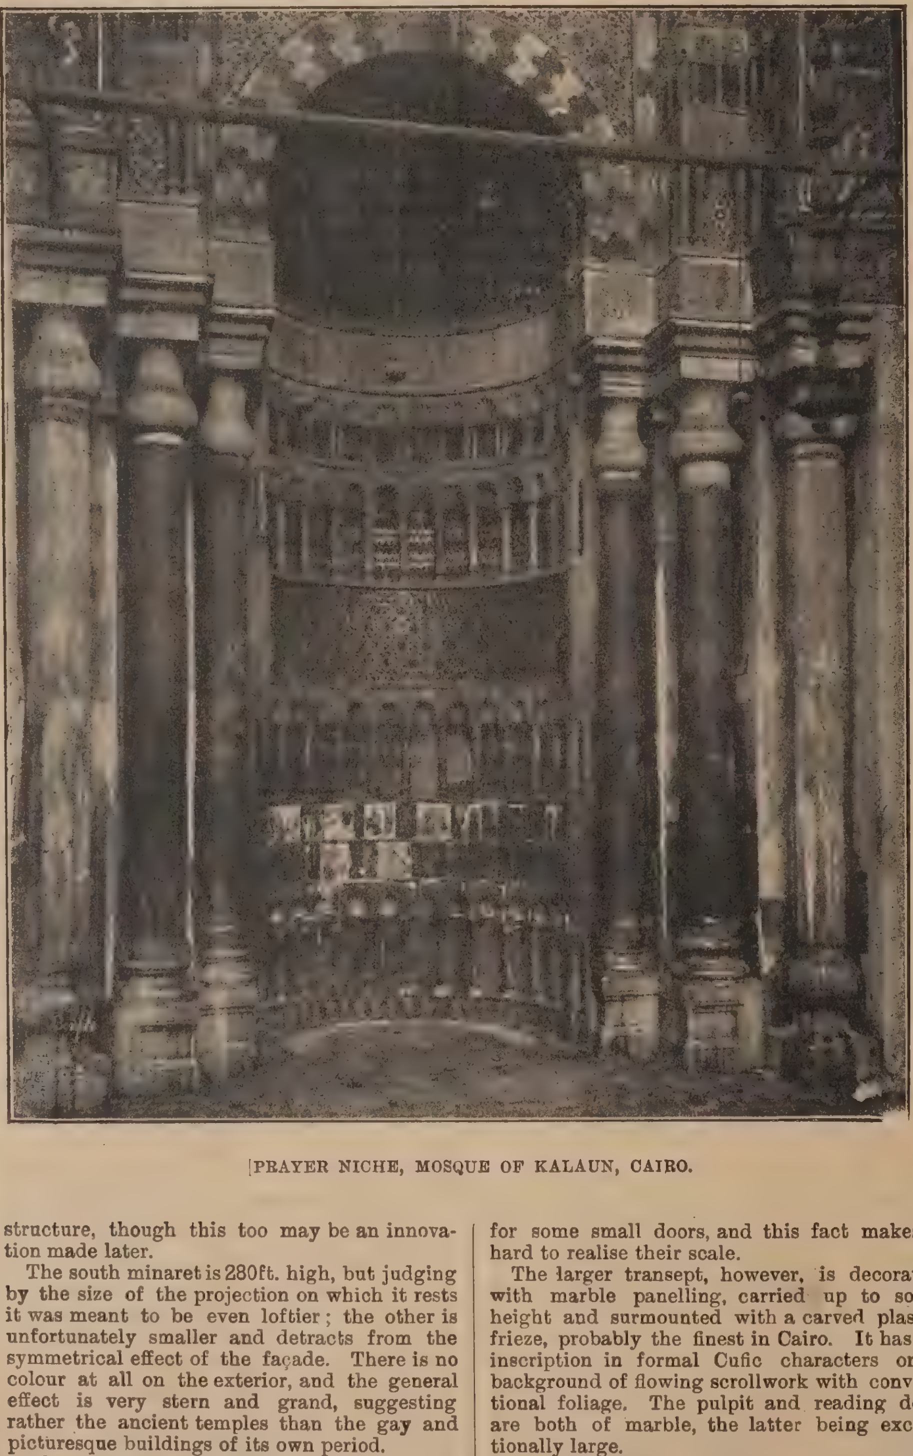
El-Azhar, dating from 973 A.D., is more irregular in plan than Tulun, consequent on its having become the great Mohammedan university shortly after its erection. The Mecca side of the court was extended until it contained ten rows of arcades, some with a second storey, and all having old marble columns and capitals, with arches resembling a stilted "Tudor."

The finest and most important mosque in Cairo, however, is of the second type, with a cruciform interior. It was begun in 1356 A.D. by Sultan Hassan, and finished in three years (see centre plate). In scale and proportions it is so huge that it seems to stand outside the style altogether, and differs largely from the average work in many points. In plan it is of irregular shape and about 500ft. by 250ft. extreme dimensions. The architect appears to have realised fully the changed conditions under which he should work in dealing with proportions so unusual. In the first place he aimed at a dignified symmetry, and with this object placed the tomb-chapel on the centre line behind the Mecca transept; on either side of it he planned a symmetrical eastern façade, terminated at the angles by projections for minarets. In accordance with the usual custom, the angles of the interior were filled in with numerous small rooms and passages, in some places of eight storeys high (which, for the sake of simplifying the plan, are here omitted), and the exterior outline of the plan should therefore have been a plain oblong. But unfortunately he encountered difficulties about the site at the west end.

Possibly the Sultan did not wish to disturb the existing streets and houses, though he might be expected to have appropriated just what he wanted. At any rate, the line of the streets was followed with disastrous results on the west side, though they are more obvious on a plan than they seem on the spot.

The worst point is the position of the main entrance, which would have added greatly to the effect of the whole if it had been on the centre line opposite the eastern transept. As it is, it occupies the north-west angle, facing north, and even so is not in line with the north side. As to the interior, the central court is open to the sky as usual, and the tomb-chamber with the dome only communicates with the rest of the building by two small doors.

The east façade is perhaps the finest part of the mosque: the material is the finest limestone, brought from the Pyramids and laid in regular courses 2ft. high. The total height of the wall is 100ft., and the cornice adds 13ft. more. The surface of the flanks is broken by high and narrow recesses containing eight tiers of windows, and the plain walling between them suggests the effect of buttresses. On the east front there are some larger windows, which light the mausoleum, and a certain amount of surface decoration. The dome is the largest in Cairo, being 70ft. in diameter and 175ft. high externally. It was rebuilt in the last century, when the section was probably brought down to the present form, as it would naturally be much sharper. It is unique in not resting on pendentives, but on squinch arches thrown across the angles of the square substructure, though this too may be an innovation made later.



PRAYER NICHE, MOSQUE OF KALAUN, CAIRO.

The south minaret is 280ft. high, but judging by the size of the projection on which it rests it was meant to be even loftier; the other is unfortunately smaller and detracts from the symmetrical effect of the façade. There is no colour at all on the exterior, and the general effect is very stern and grand, suggesting rather the ancient temples than the gay and picturesque buildings of its own period.

The principal remaining feature of the exterior is the porch, which became the model for all future entrances, though none equalled it in size. The door is set in a recess, which terminates in a semi-dome on stalactites, nearly 90ft. from the ground; the door itself is of moderate size and is surmounted by other openings. The magnificent pair of bronze doors, carved, pierced, and inlaid in radiating patterns, have now been removed to another mosque. Through the entrance, the vestibule is reached, crowned with a dome, surrounded by semi-domes all on stalactite pendentives: it is decorated with some richness in colour and relief.

A small stone-vaulted passage leads to the great central court, 117ft. by 105ft., and about the same in height, forming a cube, more or less, on each side of which opens a transept spanned by a single arch continued back as pointed barrel-vaulting. The three small transepts are 46ft. square, but the Mecca one is 70ft. across and 90ft. deep. All four arches are 90ft. high, and the vaulting behind them is of plastered brickwork, of stilted form in the case of the three first named. They and the wall-surface below them are perfectly plain, except for some small doors, and this fact makes it hard to realise their scale.

The larger transept, however, is decorated with marble panelling, carried up to some height and surmounted with a carved plaster frieze, probably the finest in Cairo. It has an inscription in formal Cufic characters on a background of flowing scrollwork with conventional foliage. The pulpit and reading desk are both of marble, the latter being exceptionally large.

The mausoleum itself has just as little decorative treatment. There is a marble dado and a carved wooden frieze; higher up, windows which have lost their stained glass, and dilapidated fragments of wooden stalactite carving, formerly in the shape of pendentives, but now so broken up that the squinch arches supporting the dome can be seen from below. The surface of the dome itself is quite undecorated, as indeed it is in most mosques, though the reason for it is not at all clear.

Generally considered, Sultan Hassan's mosque is a disappointment: its scale and general idea are superb, but the Saracens were not used to a dignified and "monumental" structure; decoratively, where they were at their best, it seems to have overwhelmed them with its size, and they hardly attempted to do much for it. The area covered is about 90,000 sq. ft., so that it claims comparison in all respects with the largest cathedrals. But the interior, though imposing, does not look its size, and suffers from the absence of a central feature, as the open court tends to break up the connection between the transepts. Had this court been covered with a great dome the effect would have been magnificent; but in such a climate this was not to be expected. The existing dome is only visible from the mausoleum, and as an external feature it might well have been higher.

Altogether, though this is one of the giant buildings of the world, it must be admitted that the Saracens succeeded more completely when dealing with moderate or small dimensions, and with this exception they wisely kept to them.

Many other mosques might be mentioned, such as Kalaun, which shows a great deal of Romanesque feeling, acquired by the Arabs in the Crusades, and contains, as the founder's tomb-chapel, an octagonal structure on eight columns which terminates in a kind of clerestory with pointed windows, and was originally crowned with a dome. Or Ibrahim Agha, with its splendid wall-lining of greenish-blue tiles. Or the two great gates of the mediæval city, with their massive domes of almost cyclopean masonry.

But the most interesting group of buildings of the late period is to be found outside the city and separated from it by a ridge of sand hills. These are the celebrated tombs of the Khalifs (see centre plate), all tomb-mosques of small size dating from the thirteenth to the sixteenth century. The largest is that of Barkuk, which follows the old cloistered plan, the arcades being vaulted domically in brick: it has two mausoleums which, with two minarets, are placed one at each angle, forming a symmetrical group. The gem of the whole style, however, is the mosque of Kait Bey (see centre plate), built in 1472. In plan it is very irregular, though not awkwardly so, like Hassan's. The mosque court is symmetrical, but the tomb-chapel is set at one corner, being of comparatively large size, while the minaret rises at a point just by the entrance porch, which itself is in a projection on the south side.

Within its limits, however, the exterior is perfect, as a picturesque group of very small scale. There is a certain regularity in the spacing of the windows and their height, and the wall-surface is broken by the recesses in which they are set. The dome itself perhaps rises rather abruptly from the octagon, in which the substructure terminates, but the decoration of its surface is a masterpiece of design and execution. The minaret is also well proportioned and groups beautifully with the entrance porch and the loggia on the other side of it. The absence of a cornice, which might seem a defect, is only to be expected in a climate where such a member would be of no practical use, and at this period of the style they are hardly ever found.

The interior is most elaborately decorated: every inch of the surface is either overlaid with marble or carved with geometrical or flowing patterns; the pulpit and reading desk, all the doors, screens, and other fittings are treated in the same way, and yet the effect is not overloaded or confused, partly owing to the diminutive size of the whole and partly to the taste and harmony of the decoration.

This mosque, in fact, shows the style at its best. The Saracens had no settled architectural idea like the mediæval Europeans. Their plans and arrangement of the different details are vague and follow no logical rules; considered on paper they come very far behind their Western rivals. And yet in surface decoration and colour effects the Arabs are supreme, as far as their religious precepts admit of it. They were instinctively artistic in everything they made, like the Greek and Gothic artists, and on the spot it is difficult to lay much stress on theoretical shortcomings in the face of the actual colours of walls, windows, marble, mosaic, and precious stones, all harmonised and luminous in the dazzling sunshine of Egypt.

Law Cases.

Architects as Arbitrators: Two Important Cases.—Two important cases affecting architects came before the Court of Appeal last Wednesday. These were *Chambers* v. *Goldthorpe*, and *Restell* v. *Nye* (see our issues for February 14th, 1900, page 31, and Jannary 31st 1900, page 414). In the former the plaintiff (an architect) sued for fees, and the defendant (a building owner) counterclaimed for negligence. The plaintiff had been employed to prepare plans for certain houses, to superintend the work and to measure it up when completed. By Clause 20 of the contract "a certificate of the architect, or an award of the referee hereinafter referred to, as the case may be, showing the final balance due or payable to the contractor is to be conclusive evidence of the works having been duly completed, and that the contractor is entitled to receive payment of the final balance. . . ." After the houses were completed the plaintiff measured up the work done and gave his final certificate. The plaintiff having sued the defendant in the County Court for the amount of his fees—namely, 4 per cent. upon £622 14s., the total cost of the work—the defendant counterclaimed for negligence by reason of the plaintiff having incorrectly measured up certain of the work done, whereby the certificate was for a larger amount than it ought to have been. The County Court Judge gave judgment for the plaintiff on the claim and for the defendant on the counter-claim for damages to be assessed. The Divisional Court held that the architect was, under clause 20 of the contract, placed in a judicial position between the building owner and the contractor with reference to giving his certificate, and, therefore, was not liable for negligence. They accordingly entered judgment for the plaintiff on the counter-claim. The defendant appealed. At the close of the argument by counsel the Master of the Rolls said that the Court would hear the case of *Restell* v. *Nye.* This action was brought by a building owner against an architect to recover damages for negligence. The defendant was employed in connection with the building of a bungalow in Sussex. He was to be paid for "plans, specifications and supervision of works" 5 per cent. upon the amount of the expenditure, travelling and out-of-pocket expenses to be charged extra. The defendant prepared a specification, and a tender submitted by a firm of builders at Brighton for the erection of the bungalow for £1,790 was accepted. A building contract was signed by the plaintiff, which provided that the price should be paid by instalments upon the defendant's certificates, and that his final certificate should be conclusive evidence that the builders were entitled to receive payment of the final balance. The work was completed, and the plaintiff paid the contract price together with the cost of certain extras on the defendant's certificates. The plaintiff alleged in this action that the defendant had omitted to check the builder's accounts with due skill and diligence, and had passed as extras works included in the contract and had certified for sums improperly passed. The building contract was in substance the same as that in the previous case of *Chambers* v. *Goldthorpe*. The only clause in which there was any material variation was the arbitration clause. Justice Mathew in the lower court gave judgment for the defendant, on the ground that he was in the position of an arbitrator and that an action would not lie against him for negligence. The plaintiff appealed. The Court dismissed both appeals. The Master of the Rolls said he would deal first with the case of *Chambers* v. *Goldthorpe*. The only question raised was one which arose on the counter-claim, and was this—whether Chambers was placed in the position of an arbitrator, or whether he was merely in the position of a person acting as agent for the building owner. If he was an arbitrator, then the building owner could not sue him for negligence; he could only sue him for fraud or collusion; and there was no suggestion in this case of anything of that kind. When they looked at the building contract it was plain that under many of the clauses of the contract Chambers was only to act as agent for Goldthorpe. But when they came to Clause 20, the question arose, did the architect still remain merely the agent of the building owner, or was he not an arbitrator? It seemed to him to be impossible to say with regard to Clause 20 that the architect's sole duty was to look after the interests of the building owner. The architect undertook the duty of bringing out a final certificate. With respect to that he owed a duty to the builder as well as to the building owner, his duty being to hold the balance fairly between the one and the other. It was argued that in this case there was no dispute, and that there could be no arbitration unless there was a dispute. In his opinion there might be an arbitration to settle what otherwise might be the matter of a dispute. His Lordship referred to the cases of *Clemence* v. *Clarke*, *Lloyd Brothers* v. *Milward* and *Stevenson* v. *Watson* (4 C.P.D., 148), and pointed out, with reference to the last-mentioned case, that Chambers had not merely to make an arithmetical calculation, but to use professional knowledge and skill. He came to the conclusion that Chambers was in the position of an arbitrator. He thought that the counter-claim could not be maintained, and that the appeal must be dismissed. For the same reasons he thought that the claim in the other case, *Restell* v. *Nye*, could not be maintained, and that the appeal in that case should also be dismissed. Lord Justice Collins said he was of the same opinion. The question seemed to him to be the same in both cases—namely, whether the architect was in the position of a *quasi*-arbitrator. If he was, then the case against him in each instance must fail. The question depended on this, whether he was in such a position that he was bound to exercise his judgment between the two parties impartially. It was suggested that he was only the agent of the building owner, and owed no duty to the builder. But in his opinion, when the building contract was read, it was clear that he was in the position of a *quasi*-arbitrator. An architect who was bound to give a final certificate, which should be binding not only on his employer, but on the other party, could not be said to be free from duty to the other party; he was under a duty to exercise his judgment impartially between the two contracting parties. And where a person was bound to exercise judgment between others involving professional skill he was an arbitrator. He therefore agreed that the appeals should be dismissed. Lord Justice Romer said he regretted to differ from his learned brethren. In the contract not only was there no indication that in measuring up the work and certifying the architect was regarded or treated as an arbitrator, but the provisions of the contract appeared to him to negative the idea that under that contract he was regarded as or placed in the position of an arbitrator. He thought that the appeals ought to be allowed.

Masters and Men.

Strike in the Aberdeen Plasterers' Trade.—The Aberdeen Operative Plasterers' Union held a meeting last week to consider the masters' decision to reduce the wages from the rate of 8½d. to 7½d. per hour. Towards the end of last year the masters complained of the dulness of trade, and intimated that they intended to reduce the wages as stated. The three months' notice having expired notices were posted last Saturday week at the various yards intimating that after that date the rate of wages to be paid would be 7½d. per hour. The men have refused the new terms and have been paid off. About 100 men are affected by the dispute.

PRESENT CONDITION OF THE BUILDING INDUSTRY.

MR. THOMAS BLASHILL, the late superintending architect to the London County Council, read a paper last week before the Surveyors' Institution on "The Present Condition of the Building Industry."

He insisted on the radical difference between the crafts that make up the building industry and the class of solitary trades and manufactures. The architect, the mason and the carpenter were not isolated artists like the statuary or coppersmith, and should any worker not understand his fellows or not look beyond his own department to the scheme as a whole, or should he act stupidly or maliciously, the whole must suffer.

The client, who was the source of all fees, wages and profits, was entitled to more consideration than he usually received, and it was not certain that architects, who were nearest him, always understood him as well as they ought. Many of them could speak from experience of the difficulty of getting his real meaning from him and embodying it in drawings so that he understood what he was getting for his money. But no pains were too great to ensure that he did, and a young architect could scarcely have a worse reputation than that of exceeding his estimates. Still, the architect must act fairly between the client and the contractor, especially in view of the fact that many persons, whether in their private capacity or as members of public bodies, thought it fair to take every advantage of the contractor and expected the architect to assist.

None but builders of good reputation should be allowed to tender; it was practically impossible to convince a committee, on the clearest evidence, of the unsuitability of a particular builder if his tender was the lowest. Sub-letting by the contractor was properly discountenanced when there was danger of his losing control of the work, or of introducing a person whom the architect might have reason to distrust, or of lowering the quality of the work. But, on the other hand, it was a very risky practice to introduce into a contract a great number of special works for which the architect had made arrangements with other parties whose tenders he put down in the specification, stipulating for the general contractor to adopt these parties as sub-contractors and pay them the amounts of their tenders. It was said that the secrets of trade lists and discounts could not be penetrated by the architect, and that the system could not be altered. If that were so the architect should cut the knot by demanding to know the lowest price to a safe cash customer, or, if that were inconvenient, should keep the reins in his own hands and see that a sufficient profit, and no more, was allowed the contractor. The worst feature in the system of discounts was that they furnished a fund from which secret commissions could be paid to persons ordering particular goods for their client. The best course was to let the contractor make, or buy, and fix everything that could be safely left to him. The modern builder on a large scale should have a fancy for machinery and be ready to seize on improvements. So far as practicable, improved conditions of labour in the shop were being applied on the building, but it was not certain how far in London this was due to native smartness, or the example of Scotland and the North, or the pertinacity of American inventors.

In discussing the English builder of to-morrow it was impossible to ignore the work of the American builder of to-day, who was a constructional engineer. With us a first-class city building might rise at the rate of one storey in three weeks; a New York building of which a model was shown in the Paris Exhibition shot up through its ordinary and plainest storeys at the rate of two storeys a week, and in the artistic upper and lower storeys the rate could not have been much slower than one per week.

Coming to the subject of the building operative, Mr. Blashill paid a tribute to the skill of the old artificer in wood and stone, and then referred to the depressing effects of time-wages, and the fixity of position of such men without reasonable expectation of betterment while craftsmen, and with no assurance of a comfortable provision against old age. The trade union was a natural engine for accomplishing what the isolated craftsman could not bring about for himself. In regard to the prevention of sweating, questions between payment by time and payment by results played a leading part. Not that in the eyes of the workman there was anything specially sacred in either; there were now far more men, trade unionists, paid by the piece than by time, and payment by piece was as stubbornly fought for in some trades as payment by time in others. What really was the fair day's work of which the fair day's wage was the equivalent? "Labour" was often confused with "time," with mischievous results. Not workmen only, but the rest of us, got into a habit of talking about our "time" as if it were something valuable by which money ought to be made. But mere time was worthless to anyone except the owner, if even to him. What the employer really bought was so much improvement to the material he put before the workman as might reasonably be expected to be done in the time by which the payment was calculated. This was simply measurement by the town clock instead of by the 5ft. rod, and if a day's work were a fixed quantity the clock would measure it as accurately and much more conveniently than any scale of feet and inches. Yet, on this side the Atlantic, no workman, no employer, no public authority had seriously attempted to apply in our own industry any kind of measurement, even the rudest, to the "day's work" itself. Surely the Chicago plumber's method of declaring how much he would do in seven hours and then claiming the right to do it in five with seven hours' pay was in principle honest and fair. The desire to have an easy time was common among time workers of every class, but a more serious matter than mere idleness was the deliberate loitering of which employers had long complained. There was also the important question of work lost to trades by changes in modes of construction, apart from the policy of employers or employed. Thus, the demand for fire-resisting construction had already affected the carpenter very seriously. Mason's work, which for a time recovered its place after a long struggle with imitative cement, had now to compete with cut-brick work and terracotta; it was said that this change was due to a mason's strike. In the case of the plasterer, such disputes were dangerously interesting. There were a dozen substitutes for plaster—none perhaps quite satisfactory, but a single architect was now using one of them by the acre—and he had let slip the artistic and interesting branch of his work. On brickwork, which seemed least liable to be supplanted, concrete was encroaching fast—concrete that just failed to become a dangerous substitute twenty years ago, when brickwork was hardly more than half its recent price.

Apprenticeship of the old pattern, in which the youth was bound for seven years, during two or three of which he learnt very little and was of little use, was vanishing with other mediæval customs. The workmen had deemed it necessary for their own protection to limit much more stringently than formerly the admittance of apprentices; indeed, in some trades it was practically impossible to get a boy apprenticed uuless he was the son of a man in the trade. The position of the building operative had been improving, and there was no reason why he should not, like the poorly-paid French artisan or the doubly-paid American, leave his work at night in a condition as to dress and general appearance good enough for any company into which he might care to go. We were as yet only at an early stage in technical education; at present it was necessary to see that public money was spent only on such as had actually entered their trade, but this was not a rule without exceptions, and the knowledge of tools and processes must very soon become as common as the knowledge of arithmetic. In conclusion, Mr. Blashill asked why all those engaged in the building industry should not learn the different crafts that composed it in the same school and at the same bench, at least so far as they had to travel together. The workmen would leave comparatively early in the journey and the rest at stages which preference or necessity might dictate. But so far as they might journey together they would be learning the very same things. They would understand each other for the rest of their lives, and, if one who might have started with lower ambitions should find his way into the higher grades of the industry, it was not the class to which the speaker belonged that would begrudge him the success he had earned.

CEMENT MANUFACTURE.

At the meeting of the Institution of Civil Engineers held on February 26th last a paper on "The Rotatory Process of Cement Manufacture," by Messrs. W. H. Stanger, M.I.C.E., and B. Blount, A.I.C.E., was read. It described the rotatory process of manufacturing cement, which presented the advantages that the operation was conducted continuously and mechanically instead of intermittently and by the aid of much hand labour, and that the product was better and more uniform than that obtained by the old method. By this process it was possible to approach the theoretical ratio of acids to bases represented by the equation $\frac{CaO}{SiO_2 + Al_2O_3} = 3$, and to obtain a cement which was stronger and sounder than the best cements commercially prepared by discontinuous processes. The output per unit of plant was more than double that of the best fixed kilns, and the consumption of fuel was smaller; a cheaper class of fuel, namely, small coal instead of coke, could be used. Various forms of fixed kilns were described and discussed, and their merits and defects were pointed out. The history of the evolution of the rotatory kiln was traced. The earliest practicable form of rotatory kiln had been invented by the late Frederick Ransome, A.I.C.E., who burned powdered raw materials in a revolving cylinder heated internally by producer-gas. His chief object had been to produce cement already ground, but this had necessarily failed because powdered raw materials agglomerated during burning; the process had not been successful because the clinker produced adhered to the firebrick lining of the kiln and ultimately destroyed it, and because a high and regular temperature could not be maintained by producer-gas without the use of regenerators, and when these were used they became choked with dust from the materials in the kiln.

The next important improvement in the rotatory kiln had been effected by Mr. Wilfrid Stokes, A.I.C.E., whose apparatus presented many features of interest. In this apparatus slurry was dried on a drum heated by the waste gases of the kiln. The kiln itself was heated internally by producer-gas, and the hot clinker was passed down a cooling cylinder, where it heated the air used in burning the producer-gas; thus its heat was regenerated. The apparatus had worked well save for the corrosion of the firebrick lining by the clinker and the difficulty of controlling the temperature. Various forms of lining had been tried, including bauxite bricks, but without complete success.

The percentage of coal needed to burn raw materials to cement clinker was computed under various stated conditions. The calculated minimum quantity amounted to 8·23 per cent. on the weight of the clinker when dry raw materials were used, and the waste gases escaped at 300deg. C. (572deg. Fahr.). When the raw materials were in the form of slurry containing 40 per cent. of water, the calculated minimum quantity was 19·40 per cent. with the waste gases at 300deg. C. (572deg. Fahr.), and 17 01 per cent. with the waste gases at 200deg. C. (392deg. Fahr.). Tables were given showing the allocation of the heat to the performance of the chemical reactions necessary to produce clinker, to the heat lost in the clinker and in the waste gases, and to the drying of the slurry when wet raw materials were being dealt with. This last-named item was large, being nearly 50 per cent. of the total quantity of heat requisite.

The successful development of the rotatory process in America had been aided in great measure by the cheapness of petroleum in that country. The difficulty of obtaining and maintaining a high and uniform temperature disappeared when oil was substituted for producer-gas. The lining trouble had remained except in one case where it had been completely overcome. The largest and most complete installation of rotatory kilns was that at the works of the Atlas Cement Company of Northampton, Pennsylvania, which had been examined by the authors in 1898. The output of this works was between 8,000 and 9,000 tons per week, *i.e.*, about four times the amount of most large European works, and the whole quantity was obtained from rotatory kilns. There were at present 51 kilns in operation, and 48 were about to be added, nearly doubling the output given above. The whole of this plant was on the rotatory system invented by Messrs. Hurry and Seaman. The raw materials used by the Atlas Company were a calcareous shale and a limestone. These were crushed, dried, finely powdered and fed mechanically into rotatory kilns. The kilns were steel cylinders 60ft. by 6ft. 6in, set on a slight incline, and capable of being rotated by suitable gearing. The fuel was powdered coal driven in by a blast of air through an injector burner at the lower end of the kiln. An intensely hot flame, readily controllable, was thus produced, and heated the raw materials introduced at the upper end of the kiln, and caused to travel downwards in a direction opposite to that of the blast. The materials were thus heated systematically, and at the lower end of the kiln near the burner became converted into clinker. This fell into a rotating cylinder lined with firebrick, through which passed a current of air serving to feed the coal-dust flame. A great part of the heat of the clinker was thus regenerated. The clinker was then roughly crushed between rolls which worked under a spray of water and passed through a final rotating cooler into trucks, by which it was conveyed to stock-boxes over the grinding-plant. Huntingdon mills were used for the whole of the grinding-plant, whether for raw materials, powdered coal or clinker. From the crushing of the raw materials to the storing of the finished cement no hand labour was employed, all conveyance, distribution and transmission being done mechanically. The firebrick lining of the kilns was protected by a layer of clinker which was perfectly effective. The crushing, watering and cooling of the clinker had the effect of maturing the cement, and storage and aeration usually necessary for cement made by the old process were abolished. Tests and analyses of the cement showed it to be of high quality and perfectly sound. The cost of manufacture did not exceed 12s. 6d. per ton, as against an average of 20s. for cement made on the old system. The process could be applied with success to wet raw materials, and a large plant for treating these was now being erected in this country. When wet raw materials were used they were pumped in the form of slurry into the upper part of the kiln which was then unlined, and were dried by the waste heat of the furnace-gases. In other respects the process was identical with that using dry raw materials. A table of comparative costs of the old and new systems was given, which justified the conclusion that the complete replacement of fixed kilns by a well-devised rotatory system would take place in Europe as it was already occurring in the United States.

Improvements at Bude.—A new post office building has been erected recently in the centre of the town on the site formerly occupied by a part of the Globe Hotel. Mr. Beckley, of Holsworthy, is the builder, and Mr. James Crutchett, of Stratton, the architect. On part of the site a couple of shops will also be erected, and on the other part a new hotel, to be called the Blanchminster. The footpath from the railway station is also being made. It is hoped that the Bude water supply will very soon be commenced, and the lighting is also to be taken in hand.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Coloured Mortar and Bricks.

NEWCASTLE-ON-TYNE.—B. P. writes: "How should a lightish mortar be composed to get a picturesque effect with red brickwork? How is the yellow coloured mortar sometimes seen in south country houses obtained? Where can rich coloured thin red bricks of interesting surface be procured and would their carriage here make them very ruinous in price? Do you know who makes "Keymer" bricks? Can the mouldings of sash bars be placed outside with satisfactory results, exterior effect being chiefly considered?"

To me the questions are somewhat vague. If the mortar is intended for pointing brickwork, a light coloured mortar is composed of lime, putty and sand, and a yellow coloured mortar is composed of lime, putty, yellow ochre, silver sand and copperas, the proportions being regulated according to the desired shade. If the mortar is intended for external plasterwork, a yellow tint is obtained by an admixture of yellow ochre, or yellow oxide, with the material used for the setting coat. A durable yellow tint is also obtained by using a bright yellow sand, such as Arnold's Fletic sand for the setting coat. Red coloured thin red bricks with more or less interesting surfaces, may be procured from most brick manufacturers; apply to some of the makers who advertise in the columns of this journal as to red bricks and Keymer bricks. Moulded sash bars, wood or iron, can be placed outside with satisfactory results if painted periodically. Exterior effect depends upon the design. W. MILLAR.

Architects' Registration Bill.

LONDON.—A. B. writes: "I have noted your recent replies about the Architects' Registration Bill, but I should be glad if you could give me any information on the following points:—In the event of the Bill becoming law, will an assistant who served some years in a builder's office to gain experience, and is now an assistant in an architect's office, be entitled to be registered without examination, provided he has served altogether the stipulated seven years before the passing of the Act? Can you say what the qualifying examinations will be?"

We do not think it expedient to further discuss in detail a Bill which has not yet been passed in substance. Sufficient particulars have already been given by us in the replies mentioned.

Drawings for Patents.

BELFAST.—LAGAN writes: "Are drawings for the Patent Office to be made on cloth; is colour desirable; and what scale should be adopted?"

For all information regarding patents apply to the Comptroller-General, Patent Office, 25 Southampton Buildings, Chancery Lane, W.C. So far as we know, it is not imperative to make drawings on cloth, but it is probable that there are certain regulations as to size. Colour and wash work are not allowable, as the drawings in the specifications have to be reproduced in line, not in half-tone.

A Book of Poems "Arranged as Parts of a Gothic Church."

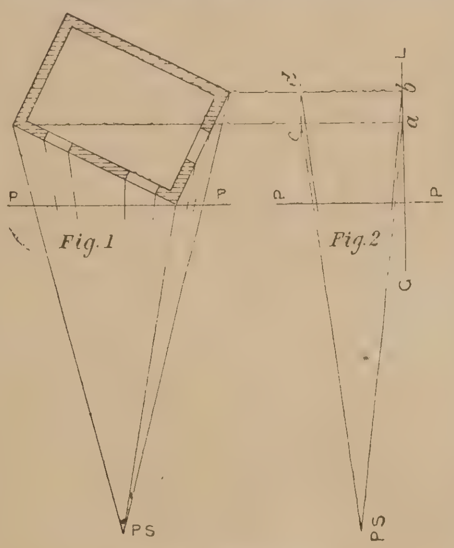
SOUTHPORT.—QUERIST writes: "I should be glad of any information concerning the authorship or editorship of a book published by Messrs. James Parker and Co., of Oxford, called 'The Cathedral: or, the Catholic and Apostolic Church in England.' The copy before me is the third edition, dated 1841, and the preface bears date 1838. The book is a book of poems 'arranged as the parts of a Gothic Church.'"

The author of "The Cathedral" was the late Rev. Isaac Williams, the following account of whom is taken from "Foster's Alumni Oxonienses (1715-1886, page 1,568):—"Williams, Isaac, 3s. of Isaac Lloyd of Cwmcynfellin, Co. Cardingan, arm. Trinity Coll., matric. 7 July, 1821, age 18; scholar 1822-31. B.A. 1826, M.A. 1831, fellow 1831-42, B.D. 1839, philosophical lecturer and tutor 1831-42, dean 1830, rhetoric lecturer, vice-president 1840, held various curacies 1829-42; wrote Nos. 80, 86, and 87 of 'Tracts for the Times,' died 1 May, 1865, father of Anthony C., and of John Edward."

Office Perspective.

EDINBURGH.—PERSPECTIVE writes: "In the issue for February 13th your reviewer of 'A New System of Perspective' states that architect's perspective is substituted owing to the 'school' system being too complicated for office use. Is there a recognised system for the preparation of architectural drawings?"

There is no one general system in use in offices, but the simplest method is shown in the accompanying figures. Any draughtsman can adopt it, though he knows nothing of perspective, but of course the difficulty increases as the building becomes more complex. The plan being pinned down on a table, the point of sight, P S, Fig. 1, is selected, which may be off the paper, and perpendicular to this a line P P is drawn, representing the picture plane and touching the nearest edge of the building.



OFFICE PERSPECTIVE.

This may be on a strip of paper pinned down in place if the sheet which contains the plan is not large enough. Then marks are drawn across line P P from all the important features of the plan. The strip is then taken up and pinned horizontally along the bottom of the sheet upon which the perspective is to be drawn, and verticals through these points will give the position, on each side of the centre, of all vertical lines in the perspective. To cut them off at the right height the following procedure may be adopted. Pin down a new strip of paper, P P, Fig. 2, in the place of the former one, to represent a vertical section of the picture plane, and another strip, G L, to represent the distance of the ground line below the line of sight from P S, and drop perpendiculars on G L at *a* and *b* from the angles of the building, produce to *c d*, so that *a c* and *b d* represent the height of these angles; then lines drawn towards P S will cut P P at the heights above G L required for horizontal lines to cut the verticals on the perspective representing these angles. The perspective of the rectangular block is now drawn by joining these intersections, and, the converging lines being produced, the vanishing points will be found. Any other height, as windows, doors, &c., is set off on the line representing the nearest angle in the perspective, and drawn towards the vanishing points to intersect the verticals. HENRY ADAMS.

Claims in Respect of Defective Work.

BROADSTAIRS.—C. W. writes: "An alteration to business premises intended and specified to be done well has been carried out badly. It was of great importance that the place should be opened as soon as possible, so very little could be condemned and re-executed during the progress of the works. This is clearly unfair to the clients, who desired and agreed to pay for good work. Can a deduction be made at the settlement; and, if so, how should a fair sum or percentage be determined? Should the builder be allowed to stop small shrinkages in hardwood joinery fitting?"

A case of this sort is very difficult to deal with. The right course to have adopted was that of insisting upon sound work, trusting to a properly-worded penalty clause in the agreement for compensation for any resulting delay. This not having been done, the certificates given from time to time have become *primâ facie* evidence that the work is satisfactory, unless they were endorsed to the contrary. Now the only thing to do is to refuse the retention money until all defects are rectified. If they cannot be rectified, a substantial claim for damages will have to be made on behalf of the client, and, if necessary, carried to arbitration. It is better to do this, and to have shrinkages, &c, put right by a reliable man, than to trust again the builder who has proved unsatisfactory.

G. A. T. M.

Nuisance Caused by Drain.

AN OLD SUBSCRIBER writes: "Several years ago a speculating builder erected four or five houses on a piece of land in an urban district adjoining a street (at which time no main sewer existed) and laid a drain entirely within his ground emptying into a cesspool. At the end of the drain in the garden of the end house (now belonging to A) there is a syphon close to the garden wall, which adjoins the street where the drain connects with the Council's sewer. A complains that a nuisance is caused by the syphon sometimes becoming choked, and calls upon the Council to rectify the matter. What course should the Council take? Part III. of the Public Health Acts Amendment Act, 1890, has been adopted in the urban district."

Having adopted Part III. of the Public Health (Amendment) Act of 1890, the District Council have good grounds for declining to acknowledge any liability for the maintenance or repair of the drain and syphon referred to. Clause 19 of this Act states: "(1) Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under section 41 of the Public Health Act, 1875 (relating to complaints as to nuisances from drains), and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses in such shares and proportions as shall be settled by their surveyor or (in case of dispute) by a court of summary jurisdiction. (2) Such expenses may be recovered summarily or may be declared by the urban authority to be private improvement expenses under the Public Health Acts, and may be recovered accordingly. (3) For the purposes of this section the expression 'drain' includes a drain used for the drainage of more than one building." If the drain or syphon becomes a nuisance, the Council should take action as there laid down. The evidence and decision given in the case of *Seal* v. *Merthyr Tydvil* District Council (Queen's Bench Division, July 10th, 1897) will repay careful perusal. In this instance the Council had adopted the Public Health (Amendment) Act of 1890. The following brief outline gives the main facts. A drain was made at the back of houses Nos. 21 to 40 Cromwell Street, Merthyr Tydvil, running through the gardens of the houses, and then joining the sewer of the District Council. Each house was connected to the drain at the back by means of a branch drain. This drain, being in a defective condition, became a nuisance, and proceedings were taken under Section 41 of the Public Health Act, 1875, as amended by Section 19 of the Public Health (Amendment) Act, 1890. The District Council contended that the drain running at the back of the houses was a private drain under the definition in Section 19 (3) Public Health (Amendment) Act, 1890. The local magistrates found that the drain was "a drain used by two or more houses belonging to different owners, and that it was a drain for the particular houses Nos. 21 to 40, and for no other premises." An appeal was made against this decision, but it was upheld by the Queen's Bench. The judges (Mr. Justice Cave and Mr. Justice Ridley) considered that the intention of the Act was to relieve the public from paying for that which they were not allowed to use, and that this drain was a private drain, insomuch that there was no power to drain other houses into it. The case now submitted appears to be generally analogous to that occurring at Merthyr Tydvil.

T. E. C.

Agreement between Builder and Client.

Belfast.—Archos writes: "I should be glad if you could give the correct form of agreement between builder and client, and also the correct form of bond. Are printed forms obtainable, or should the architect write them himself?"

A building agreement must state clearly the nature of the work to be done, the conditions under which it is to be performed, and the consideration or payment for its performance, and must be signed by each party in the presence of a witness who must sign as witness, be dated, and be deposited at any post office within fifteen days of its date in order that it may be stamped, for which a charge of 6d. is made. A form of agreement, which includes a set of conditions of contract in very general use, but not in all respects suitable to country practice, is published by the Royal Institute of British Architects, 9 Conduit Street, Hanover Square, W.; but it is quite sufficient if the form be worded as follows, the various plans and documents referred to being also properly numbered and initialled on every page by both parties.

FORM.

Agreement made the ...... day of ...., 19.., between .... (*full name*) .... of ...... in the County of .... hereinafter called the Employer and .... (*full name or names*) .... of .... in the County of .... hereinafter called the Contractor whereby the Contractor undertakes to erect a .... (*house?*) .... at .... in the County of .... in accordance with plans numbered 1 to .... Conditions numbered 1 to .... and Specification written on pages numbered 1 to .... all being initialled by both parties hereto in consideration of the sum of .... which the Employer hereby undertakes to pay to the Contractor at the times and in the manner set forth in the Said Conditions.

Signature of Employer..............................
....

Witness to Signature of Employer ....
....
....
of ....

Signature of Contractor..............................
....

Witness to Signature of Contractor ....
....
....
of ....

There is generally no reason why the agreement should not be drawn up by the architect, but he is not allowed to charge for it. In the case of large and complex works, or where many interests are involved, it is best, however, to consult a solicitor, placing the R.I.B.A. form in his hands for guidance. If the quantities are to form part of the contract, they must also be referred to in the agreement in the same way as the specification. The period allowed for completion is usually named in the conditions, as is also the penalty for delay, which must be referred to as an agreed liquidated damage, and not as a penalty. G. A. T. M.

Period of Years' Purchase.

Bristol.—Surveyor writes: "Do the arbitration, or other, courts lay down any *fixed* number of years' purchase for the compulsory sale of freehold ground rents; and, if so, how many years' purchase? If there is no *fixed* rule, what is the usual number of years' purchase allowed? Would 10 per cent. for compulsory sale be allowed in addition?"

There is no fixed period. Every arbitrator follows his own discretion. A. O. H.

MAGDALEN COLLEGE, OXFORD.

THE Oxford Architectural and Historical Society recently visited Magdalen College. The president explained how the College was founded by William of Waynflete in the reign of Henry VI., on the site of the dissolved Hospital of St. John the Baptist. The founder being a schoolmaster as well as a cleric, founded not only a college, which was originally on the other side of the river, but a school called Grammar Hall on the site now known as St. Swithin's Quad. A portion of the building, the picturesque block admired by Ruskin, still remains. The outside of the west window of the chapel, with its battlements and niched figures, the Founder's Tower with the fine gate beneath it, now seldom opened, were viewed, then the chapel was entered and its various features pointed out. The windows of the anti-chapel were originally in the chapel—Lord Selborne restored them and had the present coloured windows put in the chapel. The west window was damaged by the storm of 1703, the storm which killed the Bishop of Bath and Wells and gave Addison the inspiration for his poem. The fine altar picture, supposed to be by Ribalta, was noted, then the party passed into the cloister through a small side chapel containing the tomb of the founder's father. The Hall was next examined. The president mentioned that the oak roof which originally surmounted it was about to be restored by the Senior Fellow, Mr. Garndly.

ENGLISH AND FRENCH CATHEDRAL ARCHITECTURE.

MR. ARNOLD MITCHELL, F.R.I.B.A., lectured last week upon some examples of English and French cathedral architecture at the Literary and Philosophical Institute, Newcastle-on-Tyne. Many would have read the latest books on this subject by the American author, Mr. Moore, and the English author, Mr. Prior. From these books, those who had read them would see what different opinions might be formed upon one subject by different individuals. Mr. Moore denied that there was anything original in our examples of Gothic architecture, whilst Mr. Prior took an opposite view. To approach the subject either in the way of contrast or comparison between the French and English churches they must consider the surroundings of the church. In English architecture it would be noticed that the outline of the building was designed so as to give a view of the building in its entirety, whereas in French church architecture the restricted site made it only possible to have a view of a portion of the building. Pictures of Wells and Rheims cathedrals illustrated this fact. The interior architecture of their churches had had a very great influence upon the construction of the whole building. In Lichfield Cathedral they had an example of this. Here they would find the vault roof and the indispensable buttress. In these vault roofs provision had to be made for the bearing of the stress and strain of the enormous weight of the building, hence the buttress and the flying buttress were imperative. The vault roof influenced the whole architectural development. King Henry the Seventh's chapel at Winchester showed admirably the distribution of the weight of the roof to the buttresses: as Mr. Moore in his book had said, "the building was simply a scaffold to hold the roof." Passing to the subject of interior decoration, the lecturer had thrown upon the screen some beautiful views of the interiors of several well-known French and English churches, notably Rheims, Amiens, Chartres, and Notre Dame cathedrals, which he described as being in the order named the finest examples of Gothic architecture in existence. One point which must have struck anyone viewing the interior of English and French churches was the difference in length presented. In English churches this reached 700ft., whilst the French were content with 300ft. or 400ft. Another difference that would be found was that of height. Someone viewing the interior of a French church had described it as a colossus on tiptoe. Although the English churches did not reach the height of 150ft., yet their symmetry was equal to any to be found elsewhere. The lecturer's comments upon the outside sculpture of the churches were particularly interesting, and although giving the palm to the French cathedrals for decorations of this kind he showed that what examples there were in this country were in every way excellent.

New Patents.

These patents are open to opposition until April 6th.

1900.—**Saw Teeth.**—4,825. J. M. Wilson, 96 to 100 Henry Street, Ancoats, Manchester. The teeth are so shaped and arranged that whilst some are scribing the wood others are cutting and removing the sawdust. A smoother and truer surface is thus obtained.

Fireproof Partitions.—23,211. The Fireproof Partition Syndicate, Ltd., and T. I. Cammell, both of 10 York Buildings, Adelphi, London, W.C. The metal framework is fixed to the joists at the top and connected to the other joists in such a manner that it may expand freely. The object is to avoid the bulging of partitions of this kind, having a metal framework covered with cement or plaster, when under the influence of heat.

The following specifications were published on Saturday last, and are open to opposition until April 13th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—2,177, Royle, heat-regulating devices. 2,221, Von Kalinowski, machine for nailing. 2,663, Gibbons and Gibbons, regenerative furnaces. 2,774, Bischof, conversion of white lead into oil paste. 3,844, Lancaster, apparatus for stirring the contents of acetylene generators. 4,220, Condy, pipe wrenches. 4,407, Stevenson, apparatus for generating and storing acetylene gas. 4,526, Clamond, gas stoves. 5,206, Walker and Hildred, safety-locking and releasing apparatus for lifts. 5,269, Restall, apparatus for drilling, &c. 5,314, Gibbons, means for preventing removal of locks. 5,945, Whitehead, device for regulating gas light from a distant position. 5,989, Thompson (*Karsten*), manufacture of incandescent mantles. 6,439, Dunbar, stave-dressing machinery. 6,452, Hailstone, covers for dust and slop carts. 6,512, Jeffery, burners for incandescent gas lighting. 7,491, Leroy, manufacture of imitation stained glass. 10,255, Edgeworth, gas-heating stove. 13,734, Murinick, incandescent gas burner for street lighting. 14,570, Haddan (*Bine*), self-closing valves. 16,307, Seifarth, artificial stone. 16,422, Sayer, kilns for bricks. 17,061, Commons, means of jointing wood with other materials. 18,759, Schroer, chimney tops also applicable for purposes of ventilation. 20,229, Shepherd, acetylene-gas generators. 20,263, Harvey and East, cowl for chimney flues. 20,795, Moser, combined fastenings and burglar alarms. 20,815, Loewe, locks. 21,074, Knopf, incandescent gas lamps. 21,192, Tidmarsh and Tidmarsh, spring-roller window-blinds. 22,853, Anderson, Thaw, Chalmers and Wright, heating and ventilating buildings. 22,914, Tidmarsh and Tidmarsh, outside window sun-blinds. 23,388, Dickmann, floor and wall coverings. 23,399, Percy Bacon and Brothers, Ltd., and Bacon, wall, ceiling and furniture decoration. 23,575, Weaver, waste fittings for baths and lavatory basins. 23,642, Reitz, appliances connected with incandescent gas-lighting apparatus.

1901.—75, Doyle heating apparatus. 408, Klingler, devices for holding open and closing windows, doors, &c.

Lord Chief Justice and Church Restoration.—The Lord Chief Justice of England went to Chatham last week and spoke at the Town Hall in aid of the fund which is being raised for the completion of the restoration of the Parish Church of St. Mary's, Chatham.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Let each man exercise his best known Art.
ARISTOPHANES.

Our Plates. MR. RONALD P. JONES's paper on "The Saracenic Architecture of Cairo" begins on page 74 of this issue. As already stated in our columns, the Royal Institute did not award the Soane medallion and £100 this year, but an award of thirty guineas each was made to Mr. M. J. Dawson, Mr. J. Munro Cautley, and Mr. J. B. Fulton. We publish Mr. Dawson's drawings this week. Mr. Cautley's design was published in our issue for February 6th.

Stonehenge: Why the Stone Fell. THERE is very little doubt that the chief reason why the stone fell recently is because during the last year or two the number of visitors has increased immensely, and their standing round the stone gazing at the remarkable structure has caused the ground round the base to be trodden into a hollow, which, when the rains came, kept the ground in a sodden state. This continued softening of the ground was too much for the immense weight of the lintel on the top, and as the stones are only from 4ft. to 5ft. below the ground and from 16ft. to 22ft. above, the toppling over was a natural consequence; and if something is not done shortly to keep the visitors and picnickers out other stones are certain to fall.

A Roman Fountain. THE paroxysm of clerical prudery aroused by a fountain in Piazza Termini, Rome, has not been settled by the action of the populace in tearing down the hoarding which surrounded the figures of the much discussed Naiads. Don Prospero Colonna, syndic of Rome, was generally suspected of having, with practical good sense, arranged this farcical result to a foolish agitation. The clerical municipal councillors brought the subject before the Municipal Council in a discussion which became so stormy that the council hall had to be cleared of the public. The discussion ended with the adoption of a motion giving the Syndic discretionary powers with regard to the fountain, and was enlivened by an amusing speech from Signor Jacovacci, director of the Modern Gallery of Fine Art, on the subject of clerical qualms with regard to the nude in art. He asked what standard the [illegible] intended to set up, when one infallible Pope (Pius IX.) had ordered the figures of the angels in the monument by Canova to the Stuarts in St. Peter's to be covered for reasons of morality, and another infallible Pope (Leo XIII.) had ordered the covering to be taken away because the figures were in no sense immoral. The motion leaves the syndic of Rome power to consult artists not connected with the municipality before taking any action with regard to the fountain. Probably if such artists are consulted they will advise the syndic to leave the fountain as it is.

Mr. Gilbert's Lectures. CONTINUING his addresses at the Royal Academy last week on the sculptors of the fourteenth, fifteenth and sixteenth centuries (see p. 64 of last week's issue), Mr. Alfred Gilbert departed from precedent by referring to the work of a living artist, Mr. Watts; it would be sufficient to give the titles of two of his works, the bust of "Clytie" and the picture "Love and Death." While influences like this remained art would never die, and the students before him must think, too, of the influence their work might have on others, and try and help to build up a living art. When Gibson modelled his well-known statue, the "Tinted Venus," in Rome, he had it on reliable authority that he worked with six of the best models in the city posed in a row on one side of him, and with casts of all the pieces in existence of the Venuses of the antique, arranged on the other side. Knowing this, it was possible to understand why the "Tinted Venus" has somewhat of a conventional appearance. Mr. Gilbert urged the students to copy the casts in the schools of the Ilissus and the Theseus, though he knew they hated doing it. But those casts contained the highest beauties of the human form, and they were the best objects of study they could have. In his third lecture Mr. Gilbert dealt with the relationship of sculpture, architecture and painting, and the influence they had on each other. After he had discussed these matters and the close connection of the art of the goldsmith with that of the sculptor, the lecturer touched on the subject of the imaginary work of art, and also referred to masonry, "that degraded art now called a trade," moulding and pointing, among others. With regard to moulding he was sure he was right in insisting that the students should know something about it, for though you could always find moulders in a great city, it was not always easy to find men who would not spoil your work. In explaining pointing to them he would make practical use of the modern machine, but he would also show them the process by which the older workers were enabled to reduce or enlarge, simply by the use of three compasses. He urged the students when modelling to use both hands at once, to work on a definite plan, and to consider always the plastic nature of the clay they handled.

"Restoring" Rothesay Castle. RENOVATION is the rage in Scotland just now, says the "Daily Chronicle." Lord Rosebery has proposed—Mr. Andrew Lang protesting—to experiment with Linlithgow Palace. Now comes the announcement that the patching up of the ancient castle at Rothesay on the Clyde—suspended by the death of the Marquis of Bute, who was its hereditary keeper—is to be proceeded with. It is a pity. The oldest part of the building dates from 1098, and it has been the scene of many historical and legendary incidents in the national history. The excuse for the "restoration" is that the burgh is about to celebrate its quincentenary. It was constituted a royal burgh in 1400, and gave to the King, when he was Prince of Wales, his principal Scottish title, Duke of Rothesay.

The Gotha Observatory. THE destruction by fire of the old observatory on the Seeberg has brought to naught the plans formed by the late Duke Alfred for the restoration of that historic building. The observatory was erected by Duke Ernest II. of Saxe-Gotha and Altenburg in 1787-91, and owes its existence to a visit of the Duke to England. The erection of the observatory marked an epoch, for it was the first example of a style of architecture suitable for the purpose intended. It was built on natural ground, whereas up to that time people had erected observatories in towers which were very unsuitable for their purpose The transit instrument stood between two pillars of porphyry, each of which consisted of one block 9ft. high, 25in. wide, and 25in. thick.

The Wonderful Discovery of Greek Statues. "THE strange and indeed sensational discovery of works of ancient art at the bottom of the sea near the Island of Cerigo (Cythera)," says the Athens correspondent of the "Times," "will be regarded as an event of the highest interest by the antiquarian and artistic world. Statues of exquisite beauty belonging to the best period of Greek sculpture have been rescued from the dark, unfathomed caves in which they have lain for, perhaps, 2,000 years and restored to the admiring gaze of a distant generation. Many of them, unfortunately, have been much corroded by the salt water; in some cases the mischief is irreparable, in others it is comparatively slight, the portions of the statues embedded in the sand being still in excellent preservation. . . ." It is evident that a vessel containing a cargo of the choicest works of art must have foundered on the spot. Many of the statues and fragments have now been brought to Athens, where they have been deposited for the present in the Ministry of Public Instruction. Foremost in interest and beauty is the life-size bronze figure of a youth, apparently Hermes. The figure is poised on the left foot, the right being thrown backward; the right arm is extended, the hand apparently grasping a wreath or a sacrificial phial. The statue probably dates from the fourth century B.C., and may perhaps be attributed to Lysippos or his school; it would, therefore, be unique as a specimen of the bronze works of this epoch, our knowledge of which has hitherto been derived from copies only. It will, perhaps, be known to posterity as the Hermes of Cythera, or of Anticythera—the spot where it was found being nearer to the smaller island. "The ship in which it was conveyed, together with the other statues, was conceivably that in which the conqueror Sulla deposited many of the great masterpieces of Greek art. The vessel was lost, according to Lucian, somewhere in the neighbourhood of Cape Malea. The removal of the incrustation from the statues by means of chemicals will require the greatest care and caution, and the piercing of the fragments of the Hermes will be a still more delicate task. The restoration of this superb masterpiece, a task of the utmost responsibility, will no doubt be entrusted to an artist of world-wide reputation."

An Interesting Statement. MR. GEORGE MIDDLETON, of Bristol, puts another complexion on the discovery, for in a letter to the "Times" he says: "I find in the memoir of the life of my late uncle, Colonel W. Martin Leake, that in September, 1802, he (then Captain Leake), with Mr. William Richard Hamilton, Lord Elgin's private secretary, were engaged in bringing home the collection of Greek works of art belonging to Lord Elgin 'in a small coasting vessel' which had been hired for the purpose. They were directed to make for the Island of Cerigo, where Lord Nelson had directed a small transport to call for the purpose of conveying the marbles to England, but, unfortunately, 'the small coasting vessel' suffered shipwreck on the coasts of the island. She went down so rapidly that there was scarcely time for her passengers and crew to make their escape upon the rocks. With the assistance of sponge-divers from the neighbouring islands 'the chief part' of the marbles (? those in the British Museum) were saved, and now the remainder appear to have come to light, but they have been immersed for less than the 2,000 years (!) that your correspondent imagines."

Old Halls in Wirral. AT a meeting of the British Archæological Association held on February 20th, Mr. S. W. Kershaw, M.A., F.S.A., presiding, an interesting paper on "Some Old Halls in Wirral" was read by Mr. W. Ferguson Irvine. The hundred of Wirral possesses many special characteristics, due mainly to its peculiar surroundings and situation. Wirral, or "Wurrall" as the old natives call it, is the tongue of land lying between the estuaries of the Mersey and the Dee. The halls and manor-houses differ in many respects from the rich examples of domestic architecture for which Cheshire is so celebrated. One peculiarity about them is the half-timber construction, which is confined entirely to the frontages, the rest of the walls being of masonry. In Bidstone Hall there is a good specimen of the style of architecture of the early seventeenth century, the house being built in 1620-22. In the deer park is still standing an old wall more than 6ft. high and about 4ft thick, built of rough stones, which is referred to in almost every lease of the hall as far back as 1609 as "the great stone wall"; its antiquity may be much greater, as tradition records it was built when wages were a penny a day. The wall is popularly known amongst the villagers as the "Penny-a-day dyke." Chief amongst the buildings described and illustrated were Leasowes Castle; Storeton Hall, connected with many memories of the historic house of Stanley, dating from about 1360 and architecturally a good example of the fourteenth century; Shotwick Hall and the partly timbered houses of Irby, Hooton and Plessington. None of these old halls can boast of having been the residence of a king or queen, yet the histories of many of them, as told by the lecturer, were romantic and interesting.

Builders' Notes.

Mr. William Sharp, builder, of Poole, died recently at the age of 65 years.

The Plumbers' Technical Schools at Lincoln are to be reopened, and they will be worked by a committee consisting of equal numbers of masters and operators.

Mr. William Jackson, painter and plumber, died recently in his 56th year. Deceased was for some time a member of the Kendal Burial Board, and also a prominent Oddfellow, being connected with the Nelson Lodge of the Manchester Unity.

"Portland" Cement from Abroad.—The law recognises a fine distinction between inaccurate "trade" names which deceive the public and those which do not, and now a protest is to be made against the purchase of "Portland" cement from abroad. Colonel Tufnell intends to represent to the Admiralty and the War Office that although Portland cement may not come from the south coast station after which it is named, the Government could at least give the orders at home and not invite tenders from abroad.

The Building Trade at Hemel Hempstead and in the locality is slack, but an estate—the Manor Building Estate—of some 200 acres near Boxmoor Station for residential and shop property is being laid out for sale in the spring. Messrs. G. B. Kent and Sons, Ltd., brush manufacturers, have secured a site at Boxmoor, and are about to build a large factory, which should improve things; whilst a motor-car should facilitate accommodation for travellers to the old town, but new borough, of Hemel Hempstead.

London County Council. — The housing question was the main subject of discussion at last week's meeting of the Council. The report of the Housing of the Working Classes Committee dealt with the Reid's Brewery site, Clerkenwell, the Tooting estate for cottages, and the Lordship Lane estate, Tottenham; particulars of the latter were given on page 62 of our issue for last week. Mr. D. S. Waterlow, chairman of the committee, in reply to questions, said they had displaced 13,179 persons and arranged for the rehousing of 14 516. Mr. Harris maintained that 16,000 had been displaced and only 10,526 rehoused. Mr. Waterlow retorted that this number included those displaced by the old Metropolitan Board of Works. Mr. Goulding, M.P., complained that the lowest rents of the cottages at Tooting would be, with daily tram fares, 7s. 6d. to 8s. 6d. per week for two rooms. The portions of the report referring to the proposed schemes were postponed.

Cement in Egypt.—In 1899 the quantities of cement imported were 292,500 casks value £104,700 E., as against 57,500 casks, in 1890, representing a value of £22,700 E. This considerable increase is due to the industrial and agricultural development of Egypt. The various hydraulic works, the construction of factories and dwelling-houses, necessitated the use of large quantities of cement. Cement has to be used for the foundations of houses, owing to the dampness of the soil. It is also employed for pavements and floors. England and Belgium are the chief suppliers, but the various Government departments usually place all their orders in England, which sends over chiefly Portland cement in 300lb. casks. Of late there has been a marked advance in prices. A cask of English Portland cement costs from 7s. to 8s. Belgium sells at lower prices than these, a 150 kilo cask costing 5·25frs. f.o.b. Antwerp, *i.e.* about 47frs. per ton c.i.f. Alexandria. France and Germany supply small quantities; Austria-Hungary does very little, but Italy's trade has increased considerably. The demand for cement tends to increase more and more in Egypt. Very large hydraulic works are now in progress at Assouan and Alexandria.

The National Association of Master Builders held its half-yearly meeting in London recently. The chair was occupied by Mr. Krauss, who was appointed chairman for the ensuing year. The Scottish Federation was represented by Messrs. Lamb and Selkirk, who informed the meeting that their federation wished to form a sort of working agreement with the National Association. The question was referred for further consideration at the next half-yearly meeting, which will be held at Glasgow. Several financial questions were referred to a Finance Committee, with instructions to present a report at the Glasgow meeting. These included resolutions in favour of clearing off a small adverse balance, preparing a scheme to raise ways and means for the purpose of forming a reserve fund to carry on the epecial work of the society, appointing an organising secretary for the United Kingdom, placing all local societies on an equal basis and joining the Employers' Parliamentary Committee. It was reported that the negotiations for affiliating with kindred associations were making satisfactory progress.

Fire Tests with Doors.—We have received a copy of No. 50 of the publications issued by the British Fire Prevention Committee. It deals with a fire test made with a $2\frac{3}{8}$in. door of Archangel deal constructed in three thicknesses and a $1\frac{5}{8}$in. teak door flush-panelled on each side, the panels being in two thicknesses. The test lasted 71 minutes and the door openings were approximately 3ft. by 7ft. The following in a summary of the effect:—In 16 minutes flame appeared over the top of the teak door; in 53 minutes the whole of the top rail of this door was alight, flame also appearing between the joints of the lower panels and muntin; in 53 minutes flame appeared also on the outside of the deal door through the vertical joint between the boards in the centre of the door just above the sill; in 58 minutes the west portion of the top rail of the teak door fell; in 65 minutes the greater part of this door fell, leaving the east stile, part of the west stile, and the bottom rail in position, though much burnt; in 66 minutes a hole about 6in. square was burnt through the deal door in the centre just above the sill, and also a small hole near the top. There was no other sign of damage on the outside, and at the conclusion of the test this door remained in position. It was afterwards found that the two inner thicknesses were practically gone. The teak door had been condemned by a district surveyor as not complying with the Building Act, the panels being constructed in two thicknesses and the total thickness being insufficient. From the foregoing it is seen that the deal door withstood the test much better than the teak door.

"The Outlook for the World's Timber Supply" was the subject of a paper read before the Society of Arts last week by Dr. W. Schlich. He gave statistics showing that in the importing countries of Europe there was a nett increase of 600,000 tons yearly. Great Britain, Germany, and Belgium were responsible for the largest consumption. All authorities agreed that Norway and Hungary were overworked, and that the exports from the forests would cease within a measurable time. Russia, with its enormous forest acreage of 516,000,000, would require all its timber for home consumption when its population reached 150,000,000. The exporting countries of Europe fell short of the annual demand by 240,000,000 tons, which deficiency would in ten years' time be doubled or trebled. What could the non-European countries do to help us? China and India would not be able to export much timber, as it would be required for home consumption. When China trade was opened up it would require large imports, which it would probably derive from the United States and Canada. Though there were 700,000,000 acres of timber in the States it could not maintain the demand which Europe was making upon it. At present the annual consumption was in excess of the annual growth, and if it continued unchecked the result would be bankruptcy. Happily, the United States Government were alive to the danger, and they had founded three Faculties of Forestry in the Universities. The number of fires had been reduced by the appointment of forest rangers, and the selection of reservations. Canada also had been unable to meet the European demand, notwithstanding its vast acreage. Finally, it was pointed out that some seven or eight million tons of timber were annually converted into pulp for the manufacture of paper. This was a serious menace to the production of coniferous wood in the world.

CHIMNEY STACKS.

BY ROBERT W. CARDEN, A.R.I.B.A.

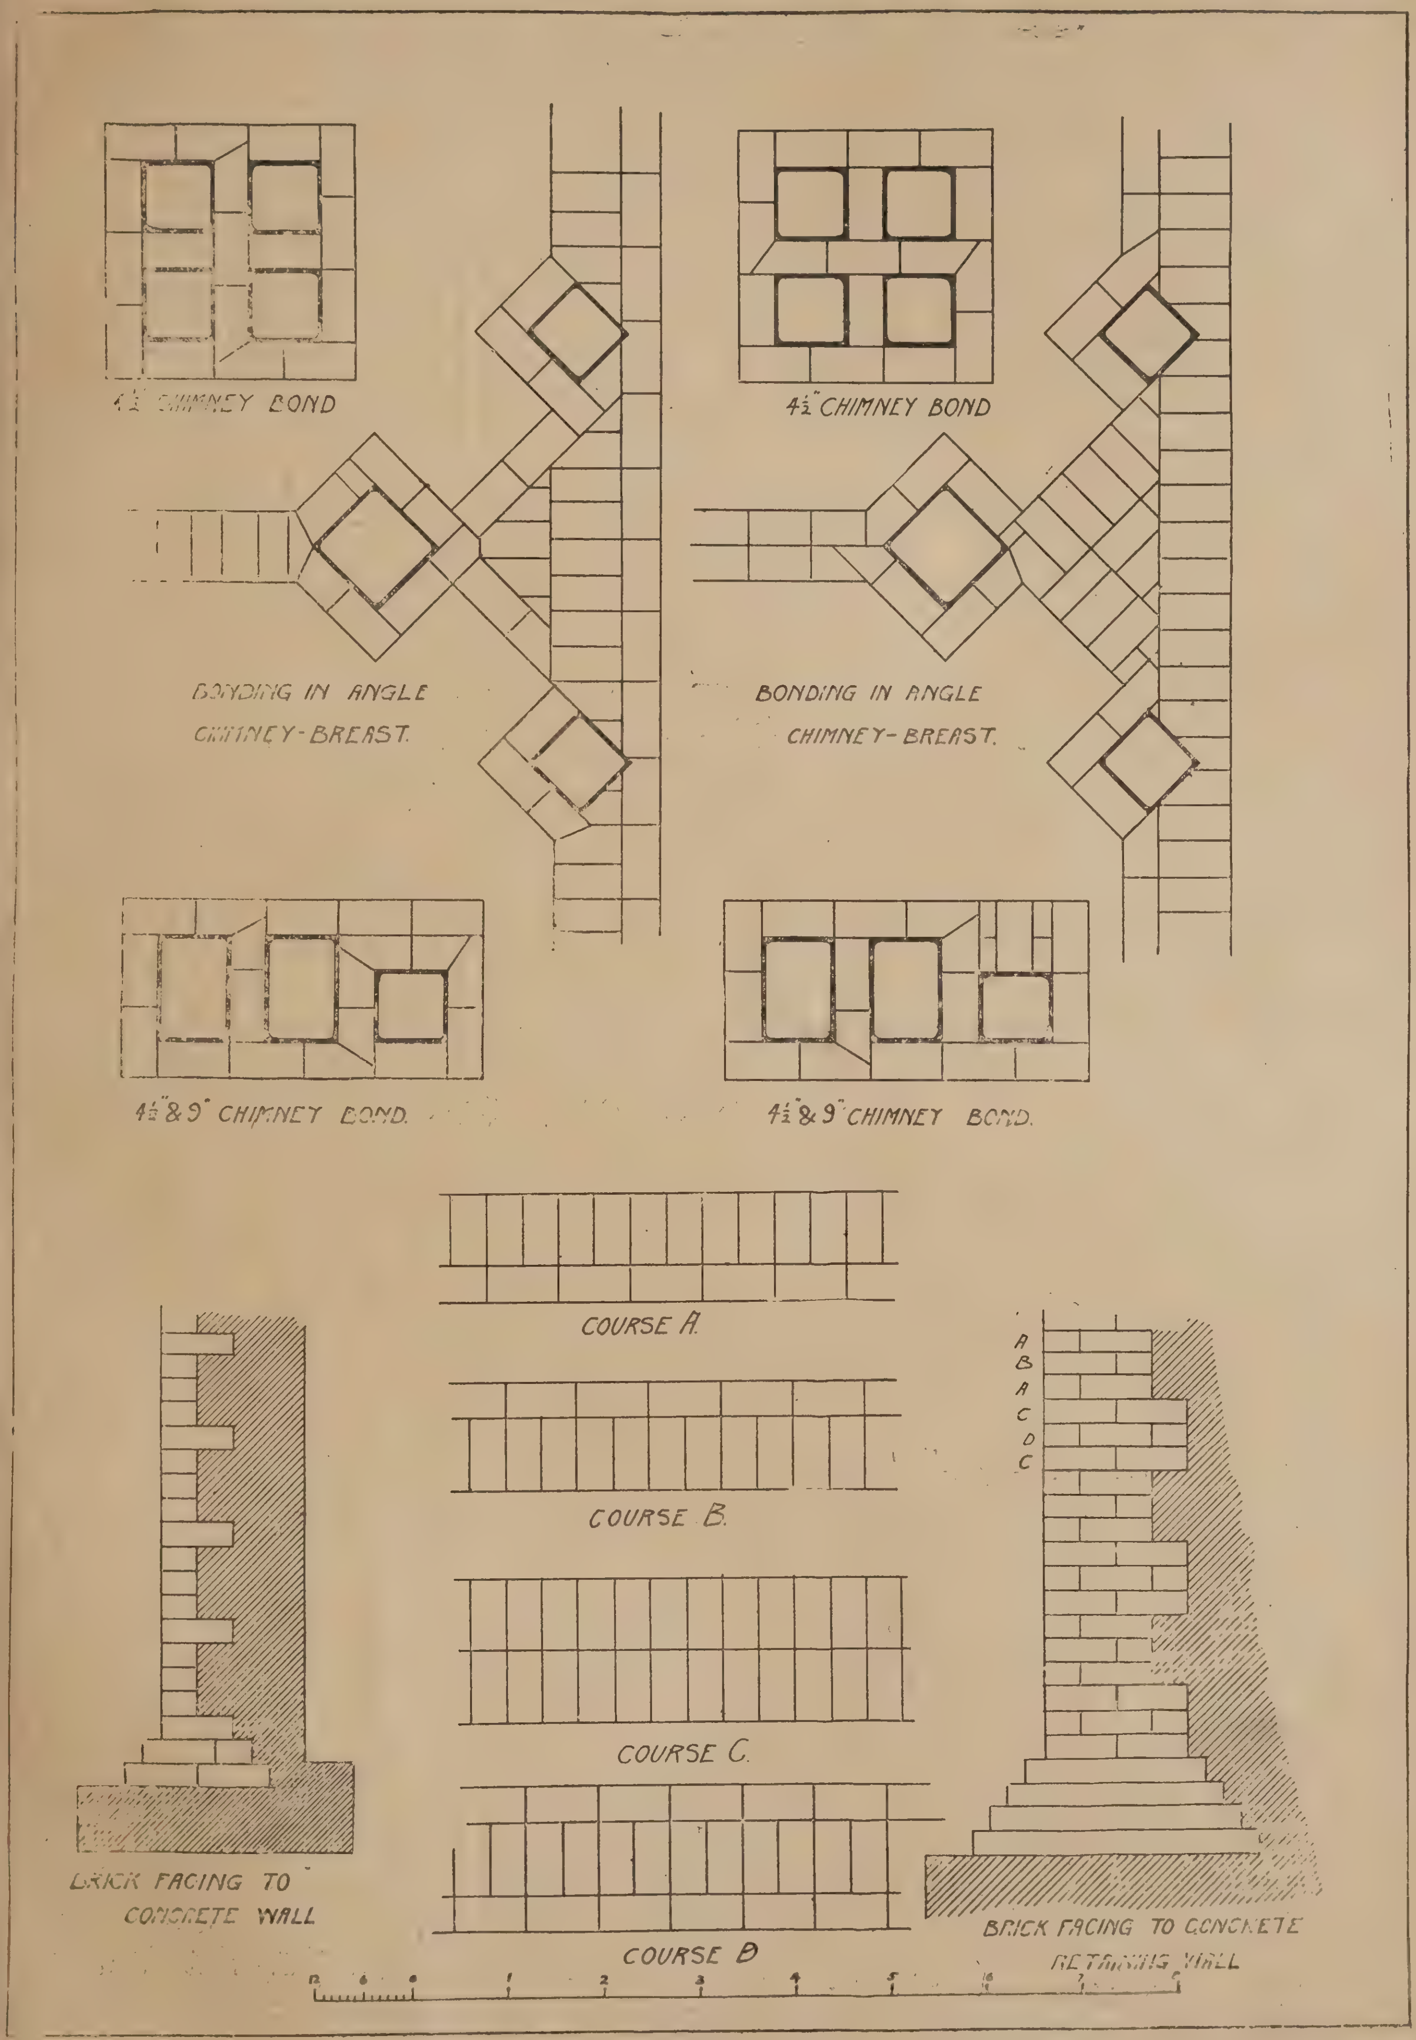
THE construction of a chimney stack, although one of the smaller details of house building, is nevertheless one which has very much to do with the comfort or otherwise of all. It is the general custom to build these with walls only half a brick in thickness, a practice which has two distinct disadvantages, while there is only point in its favour, which is, the trivial advantage of saving the cost of a few bricks. The disadvantages are (*a*) that there is only a thin layer between the flue proper and the external air, and that consequently the flue is chilled and the up-cast of the draught lessened; and (*b*) that there is great difficulty in obtaining anything like a semblance of bond. Skew-cutting is generally necessary in every course (as shown in the accompanying illustrations), but even to this there would be little objection if one could only be sure that the bricklayer would cut each brick carefully and perfectly true to the required angle. But, unfortunately, most of us know the haphazard way in which the generality of bricklayers cut their closers or skew-backs for internal and unseen work, and what little bond might have been obtained by this device is rendered ineffective through careless cutting. Given a conscientious and capable bricklayer and a flue lined with special flue-pipes, there is little objection to the half-brick stack. But the safest plan in all cases would be to have walls one brick thick, for there would be no difficulty in obtaining bond, and the extra cost of the bricks would be in part paid for by the elimination of the cutting, which is charged for, if not supplied.

The adoption of angle fireplaces very often solves a difficulty of planning as far as the architect is concerned, but the matter is entirely different when we realise as the work proceeds what an enormous solid triangle of cut brickwork has to be paid for by the client. This is clearly demonstrated by the illustrations given of two alternate courses showing two 1ft. 6in. chimney openings and three flues, two of them 9in. by 9in. and the other 11in. by 11in. (equivalent to a 14in. by 9in.). Neglecting the considerable amount of cube brickwork required, there is more than 5ft. run of splayed cutting in each course, whatever scheme of bonding may be employed. This all has to be paid for, and if the architect always thought of the expense he was incurring in adopting this solution of his difficulty there would probably be fewer angle fireplaces shown in the plans of future buildings.

Concrete walls with brick facings do not require much notice. The wall is built up in heights of 12in., the brickwork being built first, the framing at the back secured *in situ* and the concrete thrown in, and so on with each succeeding portion. The brick bonding may be one of two types: three courses of stretchers and one course of headers, or three stretchers and one header alternately in each course, the headers in one course being placed alternately between those in the course below.

A new Infectious Diseases Hospital for Southport.—A Local Government Board enquiry was held recently into an application of the Southport Town Council for compulsory powers to purchase a site for a new infectious hospital in the township of Scarisbrick, and also for power to borrow £30,000 for hospital purposes.

The Great Crucifix at St. Albans Abbey which Mr. Harry Hems and his sons were commissioned by Lord Aldenham to do for the high altar screen, is the largest sculptured representation of the crucified Christ in England. Mr. Hems formed his conception from the story in Mr. F. Marion Crawford's novel "Marzio's Crucifix," and the novelist has written to Mr. Hems congratulating him on the work.



BONDING CHIMNEY STACKS.

ARCHITECTURAL ASSOCIATION.

THE PARIS EXHIBITION OF 1900.

BY E. W. M. WONNACOTT.

A MEETING of this Association was held last Friday evening, Mr. W. H Seth-Smith, president, in the chair. Messrs. D. Hill and A. Gilbert Scott having been elected members, Mr. Wonnacott, who won the studentship prize offered by Mr. Arthur Cates, F.R.I.B.A., for giving facilities to visit the Paris Exhibition, read his paper, of which the following is a summary:—

Every eleventh year France, since 1855, has invited the nations to come and vie with her in the great industrial shows she initiated. The exhibition of last year was long foreseen, but it nevertheless was decided on in a hurry, for Berlin had intended to close the century with a magnificent universal exhibition there, but France, ever jealous of her next door neighbour, sailed in a point nearer the wind, and bespoke the date mentioned. Whichever nation it was that was to have the honour of holding the international show, there was the opportunity of closing in a magnificent way the century of artistic, scientific and commercial enterprise that has not yet been equalled in the world's history, and at the threshold of a new century era, to open the door to unknown possibilities.

Perhaps it will be well to mention here that there is now a feeling—almost universal—that these international exhibitions are being held too frequently, and one feels quite gorged with them. It would be better to have them forty or fifty years apart, in the same territory, those in the interval being held by the rival nations.

Having fixed the date so early as 1892, we see it took six years to progress to fruition. The services, staff, &c., were settled in 1893, the site decided on in 1894, and the regulations and rules promulgated in 1896, leaving four clear years, in which were to be brought forth the designs (in competition or otherwise) and the erection of the buildings themselves.

It was left to M. Alfred Picard, inspector general of roads and bridges, the official reporter of the 1889 show, to draft the preliminary ideas of the 1900 Exhibition. On the general lines laid down by him (which included for the first time the right bank of the river or the northern side), a competition for the supply of ideas was initiated in which 108 competitors entered. Parliament voted a credit of 100,000 francs for the purpose. The competitors were at liberty, by the conditions, to raze everything within the selected boundaries, except the Palace of the Trocadero and the Eiffel Tower. The majority of the competitors favoured the opening up of a new avenue from the Champs Elysées to the Invalides, which would entail the destruction of the Palais de l'Industrie, a relic of the 1855 Exhibition. Round this scheme raged a hot and angry discussion, but eventually it was decided to adopt it, and the avenue (now known as the Avenue Nicholas II.) was almost an accomplished fact. Singularly enough, towards the close of the eighteenth century, the same thing had been talked of by Gabriel, the well-known French architect of that time, when he proposed to shave off the top of the rising ground where now stands the Arc de Triomphe, and to make various extensive improvements in this quarter of Paris; the murmurs of the approaching Revolution postponed the accomplishment until our own day.

Then came the second competition, in 1896, for the arrangement of the Exhibition buildings. M. Picard having decided on the knotty problem of how to provide, on almost the same site, as regards size, as the 1889 show, about triple the area of galleries for the 1900 one. The idea being already adopted of an avenue terminating in the Invalides, with a palace on each side of it, next the Champs Elysées, the jury selected nine schemes for the large palace and eight for the small. A final ballot brought out the name of M. Girault as architect for the Petit Palais, while for the Grand Palais were selected (1) M. Louvet, (2) MM. Deglane and Binet, and (3) M. Thomas. Eventually these were associated together in the design and construction of the Grand Palais (except M. Binet, who received as consolation the commission to erect a monumental gateway at the principal entrance of the Exhibition). The architects who were placed second in the competition for the Petit Palais were commissioned to execute the architectural decorations of the new bridge, forming the connecting link between the Champs Elysées and the Invalides. MM. Casssien Bernard and Cousin, the architects referred to, were to work hand-in-hand with the engineers already appointed, MM. Resal and Alby.

The staff—the architectural department—worked under the direction of M. Picard. This was housed in a fine red brick building or pavilion, with offices on the Avenue la Bourdonnais.

Finance.

Perhaps a word or two on the financial aspect of a great exhibition may not be without value. In 1867 the State and Town furnished a subvention of 12 million francs and a Guarantee Corporation had 6 millions more in hand, but was not called on to pay, there being a balance on the right side.

In 1878 the State, jointly with the town, executed the operation, and there was a deficit of 20 millions, but of this sum 10 millions went to pay for the Trocadero. But that of 1889 resulted quite otherwise, and the surplus of receipts over expenditure reached the respectable total of 8 million francs.

The 1900 Exhibition, of which the official accounts have been already published, results in a deficiency of over 2 million francs, but this applies to the official work only. There are in addition the unofficial shows also to consider; 670 projects were submitted in the preliminary competition, sixty of them retained for the final selection; they had to pay extortionate rents for their ground space, and were moreover over-capitalised; many of them closed their doors early in the summer. The total amount of capital raised for these unofficial shows was 46½ million francs, nearly £2,000,000. So we see much money was sunk by the concessionnaires, and nothing was reaped from it.

So also in the case of the Exhibition bonds, the only means of raising money to float the Exhibition at all. Over three million pounds were easily raised by the French bankers by means of £1 bonds, which were greedily snapped up by the public; but they were practically given away, for each bond carried the right of twenty one-franc tickets for admission, a reduction of 25 per cent. on certain of the side shows, and participation in the drawings of the lotteries, the latter being the only prospect of remuneration on the outlay.

Works and Construction.

The wreckers (those wolves of the architects, as they have been called) and the navvies were looked after by a Committee of Hygiene. All the immense masses of earth that were moved, whether in foundations, road or tramway cuttings, were profusely sprinkled every day, when work ceased, with pulverised sulphate of iron 100 parts to quicklime 200 parts to every square mètre. This precaution to us may seem absurd, but it must not be forgotten that Paris is a very insanitary city, and still abounds everywhere with hidden cesspools and middens. A strong staff of inspectors were told off for this purpose of special service of sanitation.

Demolitions.

I have no data of the cost of demolishing the structures that formerly stood on the site of the late Exhibition, but I may mention that the old Palais de l'Industrie was removed for the sum of 200,000fr., only the colossal group that crowned the structure, by Elias Robert, being preserved. The dome, the Dome Centrale on the Champ de Mars site, cost 20,000fr. to pull down and the Pavilion of the Town of Paris—from the last Exhibition—20,000fr. Besides these, there were razed the Palaces of the Fine and Liberal Arts, but I have no items of costs. It is estimated that it would cost, to remove the old Galerie des Machines 1,000,000fr. if decided on.

Workyards.

The contractors' yards for heavy material were laid out in a most methodical manner, amply provided with tramways and railways, cranes, hoists, and everything desirable to facilitate despatch: and despatch was the order of the day, there being only four years to complete. The daily labour roll amounted to over 5,000 hands, in spite of the fact that everything that could be fitted together before arrival on the site was so done. There were twenty-three of these workyards, each under an architect, in some cases under two architects.

Stone.

The stone most largely used was the calcaire grossier, a white freestone largely found in the Paris basin; from the quarries of Château Landon, near Nemours (Seine et Marne), as was used for the Arc de Triomphe; also the stone from the Aisne and Oise Valleys, as the new Louvre; those of Charentenay and Courson (Yonne), as we see in the Hôtel de Ville. The ashlar work of the Petit Palais was a hard freestone from Coutarnoux (Yonne) up to the first band, and above that a freestone from Méry. In the Grand Palais, where there were about 40,000 tons (French)—17,000 cubimetres—used, the lower part was from Villebois, and was the only example I could trace of a quarry-worked stone. All the rest was cut and worked on the site, the freestone being from Euville, Lerouville (Meuse), and Larrys (Bourgogne) for the *socle*, and from Villers, Adam and Vic sur Aisne. We also see pink mottled limestone from the Côte d'Or, or Burgundy, employed in decoration and pilasters, similar in appearance to our Devon limestones. Also grey granites from Calvados, white and golden yellow freestones from Poitevin sources, and the valley of the Oise.

Stucco.

But the material most profusely used throughout the Exhibition for the temporary buildings was the stucco or "staff"[*] applied over the light wood or iron skeleton of the structures on fireproof lathing or wirework. As most of the buildings were temporary, they were executed almost wholly in this way. This "stuc" (the use of which we can readily trace back to the days of the Romans) was very largely used in the seventeenth and eighteenth centuries, and is now the universal material used by speculating builders in Paris for the vestibules, staircases, entrées, &c., and an old example can be seen by the curious in the Presidency of the Chamber of Deputies, where the stuc was coloured; the work was by Jules de Joly, then architect of the Palais Bourbon.

Ciment Armée.

Then there was the ciment armeé, or concrete with steel cores, used in large masses, profusely used in nearly all the buildings, whether permanent or temporary, especially for staircases and landings, and galleries of wide span.

Steel.

But looking back over the century just passed, the material that has come most to the front is steel. At the opening of the nineteenth century iron construction was unknown except in the form of cast girders and occasional roof trusses, either wholly or partly in iron. But the succeeding years bring us by rapid strides, through the demand for high and wide buildings, and fireproof ones, and the commercial use of the steel process, past such landmarks as the Crystal Palace of 1851, and the Gare St. Lazare, in 1867 the elliptical exhibition building, in 1878 the Machinery gallery, trusses without tie rods, of 110 metres span, by the eminent engineer De Dion, outvying our own St. Pancras Station, in 1889 the Eiffel Tower, 300 metres high, and the far-famed Forth Bridge. In 1900 steel had become almost the universal material for the frame of structures, even if temporary.

An example from the statistics will show the great economy effected as the result of previous experience, gained in the former exhibitions. In 1878 it cost nearly 5fr. per cubic metre to erect the steelwork coverings; in 1889 this was reduced to 2·77fr., while in the recent Exhibition I am assured the figure barely reached 2fr. per metre cube.

---

[*] "Staff" is a variety of fibrous plaster, cast in moulds, used only in thin sections applied over the surface of the works.

Foundations in Bad Ground.

A singular process was employed in the marshy part of the Exhibition site, where the ground was soft and spongy — that was, mechanical compression, in which a steam pile-driver was first used to perforate the ground down to a hard bottom, then to enlarge the bottom of the hole thus formed, and finally to beat down and consolidate the concrete thrown in to form the foundation, forming a large concrete pile standing on a kind of mushroomed foot on the hard bottom. This avoided the necessity of removing large masses of poor soil, and gave at the same time a stable substructure for the subsequent erections.

Estimates.

A word on the system of estimates prepared by the architects for the builders. Instead of pricing a bill of quantities, as with us, and the job going to the lowest tenderer, the architect, or his surveyor, gives in his estimate at a given figure. Invitations are then sent out to the contractors, and the game then is to find out who will give the greatest rebate below the already quoted price.

Design.

As regards the buildings collectively, one must regard this Exhibition as a spectacular achievement, an architectural fairyland; and one can overlook the faults of too exuberant, or fantastic detail, and similar things, bearing in mind that these productions were for a festal occasion, and festive they undoubtedly were: great was the variety of form and mass, extraordinary originality and vitality were displayed in the details and decorations, while most vigorous was their execution. Picturesqueness was supplied by the row of foreign pavilions on the river bank, the Château d'Eau and the gardens of the Trocadero, and other parts of the Exhibition, while dignity was worshipped in the symmetry displayed in the vistas of the Champ de Mars and the Esplanade des Invalides. All this combination was entirely due to the genius of the French architects and their unique methods of training.

Plan.

The Exhibition was laid out on four main sites, two on each bank of the river, with connecting strips bordering immediately on the river itself; but these four sites fall into two groups, each of which consisted of a piece of ground on one side of the river connected with another similar plot on the other by means of a bridge, which formed the axis of each group. Thus we have the Champ de Mars—the largest of these four plots—connected with its opposite neighbour, the Trocadero Gardens, by the Pont d'Iéna. Similarly we have the Esplanade des Invalides joined to the Champs Elysées portion by the magnificent Pont Alexandre III. Then these two groups were connected themselves by narrow enclosures or strips of ground on the banks of the Seine, as the Rue des Nations on the left bank (the Quai d'Orsay) and the Rue de Paris and the Old Paris on the right bank. But the axes of these two groups were inclined to one another, almost meeting on the south side and diverging to the north on the large bend made by the river between the two bridges above named.

The area of the site covered was much more than in previous exhibitions, and amounted to 112 hectares, including the overflow site in the forest of Vincennes, allotted to the railway and heavy machinery exhibits.

At the main entrance, overlooking the Place de la Concorde, was the Porte Monumentale, the principal entrance (of 45 in all) that gave access to the grounds. This was designed by M. Binet. A broad walk ran parallel to the river, bordered by statues, sculptures, and horticultural exhibits, leading to the magnificent Avenue Nicholas II. and the new bridge, the Pont Alexandre III., and on the right are the two Palaces of the Fine Arts, the one known as the Petit Palais (although itself an immense structure), and facing it on the other side of the Avenue the Grand Palais, the rear of which abuts on to the Avenue d'Antin. These features —the two palaces and the bridge—are intended to be permanent embellishments of the town of Paris. A narrow enclosure between the Cours de la Reine and the river, known as the Rue de Paris, contained chiefly the large pavilion of the town of Paris, by M. Gravigny; the Palace of Horticulture, with its aquarium in the centre; and the Palace of Congress and Social Economy. Each of these structures bordered on the river, and on the other side of the Rue de Paris was a miscellaneous crowd of small shows. A footbridge by the Pont de l'Alma led into the picturesque portion known as Old Paris, also bordering on the river, and emerged on the large garden of the Trocadero, where were situated the French and foreign colonial exhibits. From the Palace of the Trocadero looking south to the Champ de Mars, was the Pont d'Iéna, and opposite the Eiffel Tower; beyond it the Champ de Mars, flanked on either side by a range of palaces, and at the end the vista was closed in by the Château d'Eau and the Palace of Electricity. At the rear of the last-named is the old Galerie des Machines, still standing, and now very much transformed.

The Champ de Mars is connected with the Esplanade des Invalides by the Rue des Nations, where was the most picturesque spectacle of the Exhibition, the row of foreign pavilions abutting on the river, destined to be wiped out of existence by the time I am addressing you, although a few of them are to be re-erected in various parts of the world. On the same bank of the river, before entering the Street of Nations, were the Palaces of Forestry, Navigation, and that of the Land and Sea Forces.

Then coming to the Esplanade des Invalides, we find, as on the Champ de Mars, two parallel ranges of buildings devoted entirely to the decorative and industrial arts, the avenue between these two rows being a continuation of the Avenue Nicholas II. and the Pont Alexandre III., and terminating southwards in the fine vista of the Hôpital des Invalides. It is in this portion of the Exhibition that the buildings were designed on a high artistic level; the façades were very fine, the masses happily grouped, and the details, if somewhat exuberant, were extremely suitable, and *tous Français.*

Le Grand Palais des Beaux Arts.

This building, on the largest and most monumental scale, was, during the Exhibition, the home of the French and foreign displays of the fine arts: painting, sculpture, and architecture; but it will remain as the permanent home of the annual French Salon, and possibly will also be used as the locale of many Government fêtes and displays. The building is of immense size, covering nearly ten acres; its plan resembles the letter H. The commission for this was given to three architects, who worked together most cordially in its production and so successfully treated the various portions as to make them appear one great building externally. The front portion, that facing on the Avenue Nicholas II., was entrusted to M. Deglane, who was responsible for the immense façade and the great hall or "nave" forming the sculpture hall. M. Louvet executed the central portion, forming the link between the front and rear with the grand staircase, "l'Escalier d'Honneur," for ceremonial use, leading to the concert rooms and picture galleries on the first floor. The rear portion was allotted to M. Albert Thomas, comprising the front facing the Avenue d'Antin, a large central hall covered by an elliptic dome, and the wings.

The cost of this was estimated at 25,500,000 francs. The foundations, over 550,000 francs, were put in with great difficulty, as a portion of the site was a mere marsh, with beds of peat and clay; part of the palace is therefore constructed on oak piles, and part on concrete bedded on a sandy clay. The stonework, 40,000 French tons, in a brilliant white freestone, the calcaire grossier, was all cut on the site by a diamond saw, fed by a ten-ton traveller, running on rails. Stone was exclusively used on the external fronts, but the inner walls were of rubble and brick, faced with stone. Ciment armé, *i.e.* cement concrete strengthened with steel wire of large gauge, has been largely adopted for the staircases and galleries. Then for the roof were used about 6,000 tons of steel, executed by Daydé and Pillé, of Creil. I was informed the strains have been so carefully calculated that the resultants pass through the points of support, thus relieving entirely the masonry construction forming the enclosing screen walls of the palace.

M. Deglane was obliged to alter and modify his first conception in order that the Petit Palais, facing it, should not be overpowered by its more important neighbour. But the glory of the façade was retained in the glass mosaic frieze, about 250ft. long, designed by M. Fournier. The immense nave, or sculpture court, 200 by 55 mètres, is under one great glass roof, the central part being dome shaped, of about 230ft. diameter, carried on curved principals formed as box girders, grouped in pairs, and decoratively treated with wrought iron scrolls and ornaments.

The intermediate part, by M. Louvet, or bridge of the H, comprises a return of the *nef*, and the staircase of honour, with two short façades on the north and south sides respectively each 65 mètres long. M. Louvet had a knotty problem to settle when asked to provide for exhibitions of all sorts: the ground floor being intended for the Concours Hippiques, and equestrian performances, for sculpture and various art exhibitions; the first floor for picture galleries, and a salon d'honneur; and the basement for stables and stores; while his staircase of honour, besides being the principal means of access to the upper storey, was to be the grand decorative feature of the interior. Moreover he had to arrange this portion as a complete whole, with its own entrances, stairs, lift and service, so that it could be used for functions quite apart from the Great Hall in the rear block. At the head of the wrought-iron staircase, sumptuously gilded, is the great concert-room, for 1,500 persons.

M. Albert Thomas, who did the rear portion of the great palace, had a fine opportunity, and has produced a very fascinating work. It comprises a rectangle of 150 mètres by 45 wide, covering nearly 7,000 square mètres, with an important façade on the Avenue d'Antin, set well back from the frontage, and raised about $4\frac{1}{2}$ metres above the roadway, giving a well-lighted basement to be utilised as stables during the horse competitions, with room for 600 horses, and accommodating also all the auxiliary services of this vast edifice.

A large hall, nearly circular, forms the central feature on the ground floor, being about 29 mètres diameter and 34 mètres high, top-lighted, and of great beauty and originality of design; a large gallery running all round the outside, on two floors, and two rectangular halls in the two wings, two storeys high, containing the means of access to the upper floors, and giving an uninterrupted vista from end to end of the building. A fine frieze in bas-relief, by M. Joseph Blanc, about 300ft. long, represents the history of art, and is placed behind the colonnade. It has been executed at Sèvres, in opaque pottery or ceramic, and gave a most remarkable effect, being obviously inspired by the Assyrian friezes of Darius.

The Petit Palais.

This very fine building, to me the gem of the Exhibition, covers a surface of 7,000 square mètres, or nearly $1\frac{3}{4}$ acres. It is intended, like the grand palace, to be a permanent home for French art, a State museum in fact, and will become the property of the City of Paris. In construction it should be noted that in this building steel was used to only a limited extent. The walls were all of rubble faced with ashlar, the vaults and floors of brickwork set in gypsum, and the roofs, with a little steel, covered all. These particular vaults were constructed of brick, set in plaster, *i.e.*, the plaster of Paris, which is the universal cementing material, without any centering, only a small curved template being used as a guide; the men worked very rapidly (as plaster sets quickly) in laying the rings or courses of the domes or vaults till the shell was complete; this formed a centre for the next, and even a third, if required, shell on top of this. The cost of this style of work, very light and very strong, was 40f. per square metre; it was very quickly built, and exerted practically no thrust on the walls. The internal stucco decoration was then laid over the surface of the vault as required.

In plan this palace was D-shaped, the interior being a garden surrounded by a semicircular colonnade, round which was grouped a double range of galleries in a semi-hexagonal form for the exhibits; the straight part of the D formed the façade, the main entrance being in the centre, leading into a fine domed hall off which were two lateral galleries at a slightly higher level, and at the ends or corners, two saloons, from which one enters upon the galleries at rear. Several modifications were made in the design in M. Girault's final drawings, and even during the progress of the works, in order to harmonise with the great palace opposite. The order employed in the façade is an Ionic one, with lofty bay in the intercolumniations, the shafts being free from the wall, while in the end pavilions the columns repeat the order but are "engaged." Sculpture is used in abundance, the central porch giving us some very fine "motifs." Internally the decoration is as surprising as the scheme of the exterior, the vaults and domes being covered with relief ornament and sculpture, very fine in treatment and used unsparingly. The columns and pilasters are of a bright and cheerful pink tone.

The Pont Alexandre III.,

though purely engineering work, claims our close attention; for were not two of the leading Parisian architects employed to co-operate with the engineers? Can we point to any such example in England, or even in the world? And what is the result? The finest bridge, considered from either the constructive or decorative aspect, that has yet been seen, retaining its monumental character and bearing a great dignity in spite of its festal decorations.

The bridge is constructed entirely of steel, 350ft. in span, in one low sweep, the rise being 6½ metres, composed of fifteen girders (representing the width of the bridge, which is of the noble dimension of 40 metres), each girder being in two pieces, hinged, or articulated at each abutment and in the centre to allow of the necessary spring. The roadway had to be kept level, or nearly so, with the approaches, in order that the vista of the Invalides should not be interfered with when seen from the opposite bank. The cost of the metal work used in this bridge was about 2¾ million francs, and the accepted tender for the foundations amounted to over 1¾ million more, 12 per cent. below the engineers' price. The contractors were MM. Letellier and Boutringuien, who had already done the foundations of the Pont Mirabeau (one of the newest bridges in Paris), under the same engineers. The chief decorative features are the pylons, the dec statues, the lamp standards, the parapets, and the cartouches.

The strain on the abutments is about 50 kilogrammes per square centimetre. It took over 7,000 tons of steel, all from the Creusot works, laid from a latticed-framed gangway or temporary bridge, first erected to facilitate the placing the girders in position, and then removed. The abutments are in granite blocks from the Vosges, the only material, perhaps, that would stand the immense strain. The setting out was so carefully done that on joining up the centre the discrepancy amounted to $\frac{7}{10}$ of a millimetre on a total length of over 350ft.

The foundations had to be carried down to a depth of 54ft. on the right bank, and nearly 60ft. on the other. Caissons were sunk in the proper positions, and afterwards filled with concrete and granite. Needless to say compressed air was employed in the sub-fluvial excavations. Some very massive castings bedded in the abutments receive the ends of the fifteen steel girders, a pin, circular in section, separating the ends of the girders from the cup in the casting to allow of the necessary movement. Each outer girder weighed 167 tons, and the others 144 tons. The platform carrying the roadway is supported by vertical members, connected to the longitudinal girders and then floored over with steel plates riveted down to the substructure, and extending over the quays as well, where a system of masonry arches takes the place of the steel framing of the bridge.

Mr. Wonnacott then referred in detail to many other buildings which have already been described in our columns.

Correspondence.

St. Mary's Church, Bury St. Edmunds.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, E.C.

SIR,—In the article on Bury St. Edmunds published in your issue for January 23rd last, Mr. Walker does not mention the extremely fine panelled ceiling of St. Mary's Church, which is flat, with a central pendant of open tracery work: it is executed in stone and has a span of about 12ft. The stones are dovetailed together, and the whole forms an interesting and somewhat unusual piece of construction. This ceiling, until comparatively recently, was covered by a thick coating of plaster.—Yours truly,

R. H. MAYHEW, A.R.I.B.A.

A Memorial to Queen Victoria.

To the Editor of THE BUILDERS' JOURNAL.

WIMBORNE.

SIR,—A covered Gothic monument to my mind is the best for London; octagonal on plan, after Santa Maria Della Salute, Venice—say, 100ft. in diameter and 150ft. high. In the centre in pure statuary marble "Victoria the Good." On the walls sculptured in Sicilian marble, "The Good and Great," and also showing the progress in carving made during her reign. Materials: good granites and stone from all parts of the Empire. I can see in the idea what I think would be the greatest monument in the world, with its fine sculptured work, lofty columns and groined ceilings. A building properly warmed would preserve the most delicate sculpture, and last for all time.

Yours truly,

W. T. CHINCHEN.

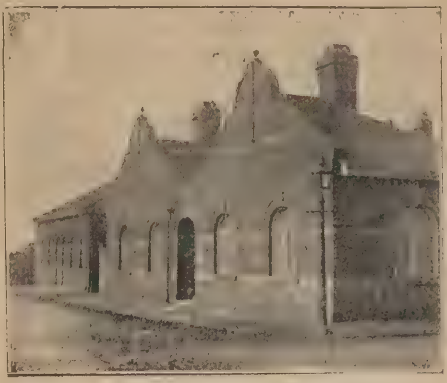
Professional Practice.

Hull.—A disinfecting station was opened at Kingston-upon-Hull last week. The buildings, which are situated in a corner position near the Albert Dock, are of a plain and substantial character, and form an interesting block inasmuch as they are about the first permanent buildings designed for this special purpose. Upon referring to the plan it will be seen that the infected person is received in one street and discharged in another after having been through waiting-room, bath-room, dressing-room, and discharged waiting-room. It will be noticed also that there are two complete suites of rooms, one for males and another for females. The clothing of the infected person is passed through a hatch from the bath-room into a corridor, and is thence taken by an attendant to the receiving-room of the disinfector and is returned from the discharging-room of the disinfector through a different corridor and delivered to the dressing-room by another hatch, so that while the person is bathing the clothing is being disinfected. The attendants are accommodated in houses on the site, and stabling is provided for three horses. There is also a disinfecting shed for cabs, and separate cab sheds for the different contagious diseases. Four one-storey cottages have also been erected where persons may stay until their homes have been disinfected by the authorities. The cost of the whole of the buildings, exclusive of land and furnishing, is about £5,500. The contract has been carried out under the supervision of the city architect, Mr. Joseph H. Hirst.

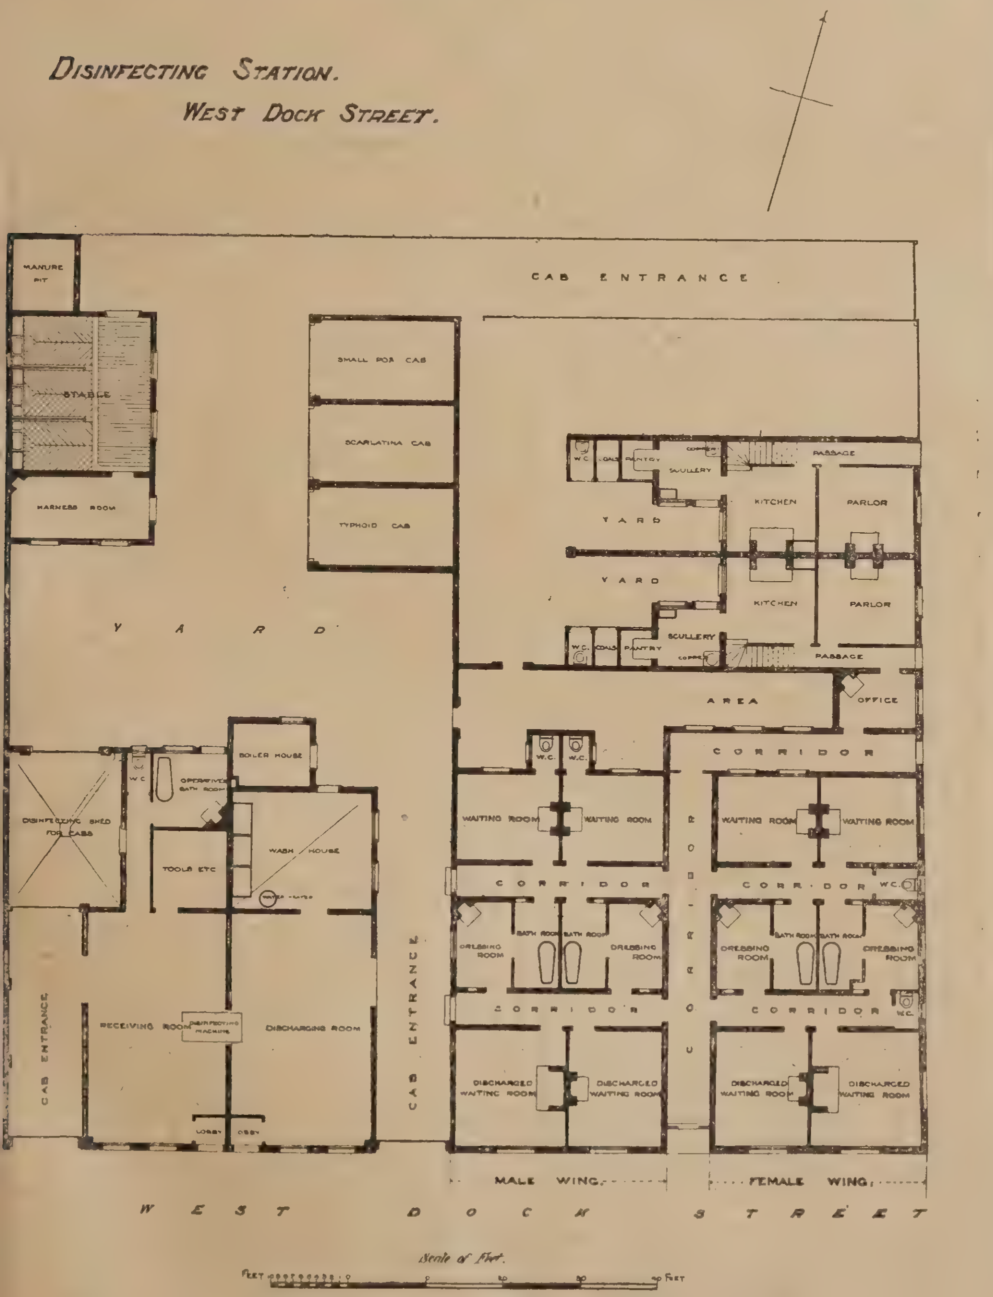
Kirkburton.—Mr. J. Berry, architect, of Huddersfield, has prepared plans for the proposed new buildings for the Joint Isolation Hospital Committee. The buildings, which are to be erected off North Road, adjoining Dean Quarry, will consist of an administration block, two storeys in height, with a southern aspect, containing on the ground floor principal entrance, matron's room, nurses' room, dress-room, kitchen, scullery, lavatory, pantry and storeroom. On the same floor there is to be a suite of discharging rooms on the western side of the block, consisting of an undressing-room, bath-room, and dressing-room, in which convalescents may take their final ablutions and acquire clean clothes before leaving the hospital. On the first floor there are six bedrooms, a dressing-room, bathroom, &c. The outbuildings are arranged on the northern side, and the tradesmen's entrance on the eastern side. The ward pavilion will be built practically on pillars, thus allowing a free circulation of air around and underneath the whole building, and will provide accommodation for fourteen persons, eight in one ward and six in the other. The entrance is in the centre of the building, having on the left a clothes store and pantry, and on the right a bath-room. Immediately opposite is the ward kitchen, having two fixed windows allowing complete observation of the two wards. The isolation quarters contain two wards with accommodation for four patients in each, with a ward kitchen in the centre. There is a verandah running along the whole length of the building. The laundry block consists of a wash-house, laundry, and drying closet, disinfecting rooms, ambulance stable, coal, coke and wood stores, mortuary and viewing-room, &c. At the entrance gates there will be a lodge one storey high, containing a living-room, scullery and one bedroom, with outbuildings.

New York.—Messrs. Herbert S. and Dudley S. Harde, who built "The Towers," at Ninety-fourth Street and Central Park West have begun work on their new Riverside Drive structure, "The Turrets." It will cost $350,000, exclusive of land. Rentals for each suite will range from $2,000 to $10,000 a year. "The Turrets" will occupy the south-east corner of the drive at Eighty-fourth Street. It was designed by the architects, Herbert S. Harde and R. Thomas Short, to be New York's latest and most improved apartment building. It will contain suites of ten rooms and three baths to twenty rooms and six baths. Its luxurious appointments will surpass any residential structure heretofore erected on Manhattan Island. The largest rentals obtained at present for any apartment do not exceed $6,000. "The Turrets" will be seven storeys high, of granite, Indiana limestone, terra cotta and brick. The architects have specially designed it to meet the demand and requirements of wealthy families who are leaving the lower Fifth Avenue districts. The building will cover an area of about 12,000 sq. ft. The twenty-room suites will occupy an entire floor, thus affording much more room than the present average five-storey private house. The large suites will include a very large foyer hall, reception room, library, den, drawing-room, music room, conservatory, dining-room, billiard-room, five chambers, five bathrooms and dressing-rooms, nursery, sewing-room, three servants' rooms, servants' bath, laundry, ironing and drying rooms, kitchen and butler's pantry. The smallest suite will contain ten rooms and three bathrooms. Safes for silver in the dining-room will be placed in the panelling of the wainscoting. Mirrors will be placed in the panels of all chamber doors. The bathrooms and kitchens will have walls and floors of pure white marble. There will be an unusual amount of closet room for every suite. There has also been arranged a large ballroom with banquet hall, a billiard room and gymnasium for the free use of tenants. In the basement will be a barber's shop, large marble swimming pool provided with hot and cold water, a general house laundry and accommodations for storing and charging automobiles. There will also be arrangements for the rental of automobiles to the tenants. There will be electric light and telephone in each suite. The servants' quarters will be built in a wing distinct from the main structure.

Portsmouth.—A new technical institute is to be erected on the plot of ground in Park Road, now known as the Mayor's lawn, behind the Town Hall, and will, it is estimated, cost £43,086, exclusive of fittings. It has been designed by Mr. G. E. Smith, of Southsea and Gosport, and will be Classic in style, so as to harmonise as nearly as possible with the Town Hall, but of a less pretentious nature. The elevations will be of red brick and Portland stone. With the object of obtaining plenty of light for the basement floor the building will be set back 5ft. on the Park Road frontage and 30ft. on the Town Hall side, and the space thus obtained is to be used as lighting areas. The technical and art schools will occupy the whole of that part of the building facing on Park Road and part of the block facing the Town Hall, the remainder being taken up by the library section and the examination hall. There are to be three entrances, one at the corner facing the Gas Company's office, being the main entrance to the technical and art schools, another in the centre of the building facing the Town Hall for the library, and the third placed at the extreme end near the railway for use in connection with the examination hall. The entrance hall on the ground floor will be approached from the main entrance by a broad flight of steps leading up through an imposing porch, and will open on to the main staircases leading to the other floors. The main corridor will branch from the left-hand side, running the whole length of the Park Road block. The basement floor, which will be 4ft. below the level of the roadway and 14ft. high, is to be chiefly occupied by workshops, &c., on the one side, and part of the library section on the other, whilst along the Park Road front are to be situated the carpenters' shop, with spacious store, the brickwork and painters' shop, a class-room for theory and dynamo, and an accumulator-room. A boiler-house, smithy, plumbers' shop, and laboratories are provided for at the back. Facing the Town Hall will be the engineering and file rooms and reference library, with a store and a book-binding room at the rear. A wide corridor will run the length of the building in the centre, and at the end of the corridor will be situated the stairs leading to the rooms above. On the ground floor facing Park Road the secretary's room, committee room, a teachers' room and four class-rooms, with mechanical laboratory and a master's room at the back are arranged for. The Free Library, with stone steps leading up to it from the roadway, is to be on this floor, facing the Town Hall, and lighted from the front by deep bay windows. Over this the examination hall will be situated, a room two storeys high with deep bay windows. The other rooms on the same floor are to be set apart for mechanics, a lecture theatre, physical laboratories, drawing offices, a dressmaking room and wood carving and biology rooms. As on the ground floor, a wide corridor will run from end to end. On the second floor, the chemical laboratories, balance-room and lecture-room will be placed over the physical laboratories, and the chemical lecture theatre is to be arranged over the mechanics' lecture theatre. At the back are to be the life-room, antique-room and painting, and two masters' rooms are provided for on this floor. Facing the Town Hall are the modelling room, the upper part of the examination hall and a spare room. The floors are to be of fireproof construction, finished with wood blocks, and the roof constructed with iron principals. The walls of the Free Library, reading and reference rooms will be lined with glazed tiling the full height, whilst the entrance hall and staircase walls are to be provided with glazed tiled dadoes in wood framing. The building is to be heated throughout with hot water by means of radiators placed in the rooms, &c. Where necessary they will be heated uniformly, and all the radiators on the external walls are to have inlet-ventilators behind them, with baffle-plates and water-trays. The building is to be lighted by electricity; gas will be provided in case of emergency, and also for experimental purposes, and hot and cold water and steam are to be laid on. Special ventilation and drainage will be provided for the chemical laboratories. Electric bells are to be fixed throughout, and fire hydrants on each floor.



DISINFECTING STATION, KINGSTON-UPON-HULL: SOUTH ELEVATION.



PLAN OF DISINFECTING STATION, KINGSTON-UPON-HULL,
JOSEPH H. HIRST, CITY ARCHITECT HULL.

Engineering Notes.

Bessemer Gold Medal.—The Iron and Steel Institute have decided that the Bessemer Gold Medal for 1901 shall be awarded to Mr. J. E. Stead, of Middlesbrough.

St. Thomas' Church, Kingsbridge, has lately been fitted with the latest improved "small-tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, of Liverpool.

The Whitechapel and Bow Railway is now in course of construction. The contractors are enabled to work night and day shifts owing to the amount of light obtained from eight of the Thorn and Hoddle Acetylene Company's gas generators, which are sufficiently portable to meet all requirements.

Leicester Tramways.—A special committee of the Leicester Corporation has commissioned Mr. Manville, of London, to mature a scheme for applying electric traction to the whole of the Leicester tramways. The committee had also recommended the overhead trolley system, but after the startling experience at Liverpool there is a strong revolution in feeling, and a growing determination to declare for the conduit system, though it must entail a large addition to the initial cost.

London Water Companies' Regulations: Collapse.—At the resumed enquiry into the proposed new regulations by the London water companies on Thursday last Mr. Cripps, K.C., on behalf of the companies, asked the Commissioners to request the Local Government Board not to proceed farther with the present enquiry in face of the opposition that the proposals had aroused from the various local authorities. Mr. Freeman, K.C., for the County Council, said of course this withdrawal on the part of the companies brought the proceedings to an end, but he thought that as the public bodies had been put to great expense their costs should be paid. The chairman said they would submit the suggestions as to costs to the Local Government Board.

Keystones.

The Central Tower of Truro Cathedral is to be completed, the money necessary for the work having been given.

Wombwell Parish Church.—A fund has been inaugurated for the completion of the new parish church. The cost of the nave has reached the sum of £5,600, but a further sum of £4,000 is required.

The new Church of St. Cyprian, at Brockley, has been consecrated. The church has been erected from designs prepared by the late Sir Arthur Blomfield at a cost of £9,000, and contains seating accommodation for 1,500 people.

New Higher Grade Schools at Sandown, I.W. have recently been erected by the Brading School Board. The schools have been built by Mr. Ball, of Cowes, from designs by Mr. James Newman, of Sandown, and, with the furniture, have cost £7,200.

A Municipal Sanatorium for Glasgow.—The Glasgow Town Council has decided to build a Corporation House at Loch Katrine at a cost of £5,000. A specially large dining-room will be the leading feature of the mansion, which is to be furnished in a bright and attractive way.

"Dual British and Metric Table Book."—The aim of this little publication (issued at 1d. by Messrs. Allman and Son, Ltd., of 67 New Oxford Street, W.C.) is to show by means of comparison the superiority of the metric system to that used in this country. The equivalents are so arranged as to be of use in turning metric quantities into British and British quantities into metric. Mr. S. Jackson, M.A. (Oxon) is the author.

A new County Asylum for Middlesex is being erected at Napsburg, St. Albans. The site of the new building is 440 acres in extent, and was purchased at a cost of £45,000. The plans are by Mr. Rowland Plumbe, who has designed the buildings in the pavilion style to accommodate 1,150 patients, 100 of whom to be in a separate building, which is to be used only by paying patients. A hospital to accommodate 234 persons is included. The estimated cost of the buildings alone is £358,100 or £311 per patient. The St. Albans site is the best in Hertfordshire.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held a meeting on Friday, February 22nd, when Mr. John G. Dunn read a paper on the "Practice of Chimney Stalk and Boiler Building." To ensure the stability of a stalk, he said, the foundations must be built with best Portland cement, with footings projecting the thickness of the wall, or inverted arches used. The stalk should have a square base, a batter of ½in. to the foot, with hoop iron horizontal ties. The brick courses should be at right angles to the batter, and no port holes cut after the stalk had taken its bearing. Further remarks were made on the subject of efficiency of draught and architectural treatment, and then the lecturer passed on to the consideration of boiler setting, explaining the various types of flues, boilers and fuel economisers.

Devizes Hospital Competition.—Forty-five designs were submitted for the proposed isolation hospital at Devizes. Two premiums of £20 and £10 were offered. Mr. C. E. Ponting, the assessor, suggested five designs from which one might be selected finally, and recommended that the premiums should be awarded to "Hygiene" (Mr. E. C. Isborn, Devizes, and Mr. George Boughton, Woodlands, Ryde, I.W.); and "Q." (Messrs. Charles Bell, Wilton, and Meredith, 3 Salter's Hall Court, Cannon Street, London, E.C.). At a meeting of the committee it was decided that if the authors of the other three selected plans were agreeable they should be retained for a time, in the event of neither of the other two plans being carried out. These designs are:—"Deviser" (Mr. H. H. Clark, 38 Bow Lane, Cheapside, E.C.); "Esculapius" (Mr. R. E. Brinkworth, St. Mary's Street, Chippenham); and "Efficiency" (Mr. J. Hugh Goodman, Town Hall Chambers, Reading).

The Roman Pavement recently discovered at Dorchester has been successfully transferred by Italian workmen to the Dorset County Museum, and now covers a large part of the floor of that institution.

A Kursaal for Harrogate.—A Local Government Board enquiry was held recently into the application of the Corporation to borrow £40,000 for the erection of a Kursaal on the Spa Estate, £9,500 for the purchase of the Starbeck Estate and Baths, and £4,500 for the purpose of conveying water from the Starbeck Baths to the Royal Baths at Harrogate.

Optical Refinements in Architecture.—Mr. George Coffey lectured recently on "Optical Refinements in Classic and Mediæval Architecture," before the Architectural Association of Ireland. Examples of these optical refinements were shown from the Parthenon of the Greeks, from Pisa and Siena cathedrals, the most beautiful specimens of Italian, Romanesque and eleventh-century work, and among many other examples some arcading from Cormac's Chapel at Cashel, where the same refinements occur.

A Barrow-in-Furness Competition.—A competition was recently held for a Board School to be built near the growing suburb of Vickerstown, on Walney Island, for the Barrow-in-Furness School Board. The competition was open to local architects only. Mr. Thos. Bell, of Burnley, was appointed the assessor, and he placed the designs of Mr. Henry T. Fowler, of Ramsden Square, Barrow-in-Furness, first, those of Mr. J. Z. Macintosh second, and those of Mr. W. Moss, A.R.I.B.A., of Settle, third. The decision has been confirmed by the Board, who have appointed Mr. Fowler their architect to carry out the work. The school is to provide accommodation for 600 children, including temporary accommodation for 180 infants, who will be removed to a separate infants' building when the requirements of the district necessitate the increased accommodation.

Rodin and the Paris Municipality.—A conflict has arisen between Auguste Rodin, the illustrious sculptor, and the Paris Municipality, which put a site at his disposal during the late exhibition to allow him to display his work. The Municipality has ordered the sculptor to vacate the ground he has occupied, though he explained that he needs a short delay to allow him to re-erect his exhibition building on another site for which he is negotiating. There is the less reason for the hurry of the Municipality, as most of the other exhibition buildings in the neighbourhood of Rodin's pavilion are still standing. Two of Rodin's statues are to find a home in England. One has been acquired by Mr. Beckett, M.P., and another, purchased with the proceeds of a subscription organised by British artists, is to be placed in the South Kensington Museum. These two works are the "Creation of Man" and a "St. John."

Art and Manual Training.—Mr. J. Liberty Tadd, of Philadelphia, U.S.A., lectured recently at Barry Dock on this subject, illustrating his remarks on the blackboard, using both hands at once. The fundamental principle of the lecturer's system was the training of the mind of the child in observation, and the training of the child's hands to instant and automatic expression of its ideas. Such aids to drawing as rules, callipers, &c., were not allowed, nor was the student allowed to rub anything out, or patch anything up, but by constant repetition to make the correct drawing of figures automatic. The lecturer claimed that the influence of such teaching fascinates children. The system taught facility first, accuracy afterwards, and not *vice versâ*, as was the custom in the textbooks. The children saw more than other people in commonplace things round about; in styles and schools of architecture they could distinguish the pure and impure with greater facility than other people, and the beauties and grandeur of a work of art—whatever it may be—did not escape their observation, although it would escape the mind which had not been trained to observe. The system is pursued extensively in America.

A Municipal Library at Grimsby has been opened at a cost of £4,000.

A new Refuse Destructor at Barry has been erected. The destructor buildings were built by Messrs. Lloyd and Tape at a cost of £2,848, the two cells by Messrs. Hughes and Stirling for £2,763, and the chimney stack by Mr. J. Prout at a cost of £1,805. The site in Barry Road has a frontage of 318ft., and the area is 1 acre, 1 rood, 25 perches.

Discovery of an Early Egyptian Tomb.—The Egyptian Research Account announces the discovery in Upper Egypt of the royal tomb of Neter-Kha, the king credited with the building of the famous step-pyramid of Saggara. His name appears on a rock in Sinai near others of the Fourth Dynasty, but relics now being found in his tomb are analogous rather to those of the Second Dynasty. The nature of the tomb itself is remarkable, and had caused it to be regarded in the past as a fort. The arched roof of its descending stairway is the earliest yet recorded, and carries back the history of the Egyptian arch to the fourth millennium B.C. The excavations are being made by Mr. J. Garstang.

The late Mr. Frederick Startridge Ellis, who died last week, was for many years one of the leading dealers and experts in old books. Mr. Ellis was an intimate friend of William Morris, Dante G. Rossetti, Burne-Jones, and many others of similar phases or schools of thought; for both Morris and Rossetti he acted as publisher. Among his many friends and patrons may be named the late Mr. Ruskin, and "Stray Letters from Professor Ruskin to a London Bibliopole" (F. S. Ellis), 1892, is one of the results of this friendship. Mr. Ellis retired from business in 1885, and his large stock of rare books realised about £16,000 at Sotheby's. Of late years Mr. Ellis has shown great activity and versatility as an editor and compiler. When William Morris started the Kelmscott Press he found an enthusiastic supporter in Mr. Ellis, who, in fact, edited about a dozen of the fine publications of this press. Mr. Ellis was born on June 7th, 1830.

New Fire Stations.—The new fire brigade station in Redcross Street, London, E.C., which has been erected to replace the smaller station in Whitecross Street, was opened recently. The freehold site occupied by the new station has a frontage of about 90ft. to Redcross Street, and was purchased for £31,000, while the cost of the building has been upwards of £12,000. The engine room is equipped with two steamers, a horsed escape, a long fire ladder, and a hose cart ready for immediate use. The chief "run out" is arranged so as to be immediately opposite the scene of the great Cripplegate fire. In the upper part of the building there are 13 suites for married men and a number of single men's quarters. The station, which is lighted with electricity throughout, has been built by the Works Department of the County Council under the direction of Mr. W. E. Riley, the Council's superintendent architect. A new fire station which the County Council have erected in Pennard Road, Shepherd's Bush, at a cost of over £12,000, has also been opened.

Restoring an Old Picture.—In the City of London Court, last week, Mr. William Thompson, of Oxford Street West, made a claim against Mr. Walter Graves, architect, Winchester House, Old Broad Street, E.C., to recover seven guineas for restoring an old oil painting and supplying an old gold frame for it. The defendant said that he was greatly annoyed at what the plaintiff had done. The picture was painted by Sir Joshua Reynolds, and was a sketch of the defendant's grandfather, who was Sir Joshua's engraver. He simply asked the plaintiff, who no doubt was an able man, to varnish the work, but instead of doing so he had added to it, and thoroughly spoilt it. The picture had been altered, and he was shocked when it was returned to him by the plaintiff. The plaintiff denied that any addition had been made to the picture, and said that no paint had been put on the face or body of the person whose portrait it was. The jury found for the plaintiff for £5, which was £1 more than the defendant had paid into Court. The plaintiff also received his costs.

COMPLETE LIST OF CONTRACTS OPEN.

Surveying and Sanitary Notes.

New Over-cliff Drive for Bournemouth.—The Town Council have decided to construct a grand marine drive and promenade along the greater part of the West Cliff. The cost of the proposed works is estimated at £10,000.

A Prescot Improvement.—A Local Government Board enquiry was held recently into the petition of the Prescot District Council for power to carry out an improvement scheme which includes the demolition of a quantity of insanitary property between High Street and Eccleston Street, and the making of a new street from High Street to Eccleston Street and a street to Hill Street

The Building Trades Exhibition.—"The Surveyor" newspaper will hold an exhibition in connection with the Building Trades Exhibition at the Agricultural Hall from April 17th to 27th next. A similar one was held about two years ago. The object in organising this exhibition is to bring surveyors into close touch with the latest developments and improvements in inventions and manufactures with which they are most particularly concerned in the discharge of their duties. The exhibition will be divided into five sections: house drainage, sanitary fittings, sewerage, sewage disposal and roads. Plans of spaces to let and full particulars can be obtained from Mr. Arthur May, 24 Bride Lane, Fleet Street, E.C.

A Suggested Ashford Improvement.—Through the combined efforts of the Ashford Urban District Council and the local Chamber of Commerce a scheme for the extension of Bank Street to Beaver, has been propounded. The scheme, as prepared by Mr. W. Terrill, the surveyor, suggests the construction of a new road to continue in a direct line from the end of Bank Street, thus securing a convenient approach to the suggested new station, in place of the railway company's proposal to locate the station entrance on the present bridge near the Victoria Hotel. This new road continues over the Stour, borders the Victoria Park, and terminates in Beaver Lane. Other new roads branch off and end facing Lower Denmark Road, and at various points in Beaver Road and Beaver Lane. The scheme, if adopted, will lead to the development of the whole of the estate included in the plan, and will provide a horter and much more direct route to the town from Beaver and places beyond.

Cannon Balls in Quarrying.—The United States Government recently sold a large quantity of old cast-iron cannon balls, which had been stored in the Charleston Navy Yard, to a Boston dealer, who has found a market for them among the Cape Ann and Quincy quarrymen. The first use they were put to was in place of steel wedges in splitting off large blocks of granite. The method pursued with the cannon balls is to start the block of stone away by a slight blast, and then between the quarry face and the block several of the smaller solid shot, usually the 4-in. sort, are dropped down into the aperture. Two men with crowbars give the blocks a slight shake, and the instant the block moves in the slightest manner forward the shots take up their purchase on the space made, when the large cannon balls, some measuring 12 or 15in. and weighing 200 or 300lb., are dropped into the top of the gap. Now the slightest outward jar by the levers on the big stone sends these heavy cannon balls dropping downward by their own weight, until, with an easy forward movement, the cube goes over on its face. These shots do away with any driving; their great weight in proportion to their size necessarily forces them downward, and their form prevents any chance of backward setting of the block. The cannon balls are also used as rollers, as they take up and go over the inequalities of the quarry surface and can be rolled in any direction without resisting, thus doing away with the old style wooden rollers. They are also used to smother heavy clearing-out blasts. Heavy rope mats are thrown over the surface where the blast has been set and these cannon balls are thrown on the mats.

New Companies.

George Glover and Co., Limited.

Registered February 21st to acquire the business now and hitherto carried on at 122 King's Road, Chelsea, and to carry on the business of dealers in dry gas-meters. Capital £60,000 in £1 shares. The first directors are D. T., G. R., and J. W. Glover.

Reid Brothers, Limited, Glasgow.

Registered in Scotland to acquire and carry on the existing business in Glasgow, South Africa and Australia, of merchants, commission merchants and agents, ironmongers, timber and machinery merchants, &c. Capital £80,000 in £1 shares. Registered office: 67 St. Enoch Square, Glasgow.

COMING EVENTS.

Wednesday, March 6.

BUILDERS' FOREMEN AND CLERK OF WORKS' INSTITUTION.—Ordinary Meeting of Members, at 8 p.m.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Evening and Council Meeting.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at Soap Works at 3 p.m.

CHURCH SANITARY ASSOCIATION.—Public Meeting, Westminster Palace Hotel, at 3 p.m,

Thursday, March 7.

CARPENTERS' HALL, London Wall, E.C.—Mr. John Slater, B.A., on "Celebrated Ancient Buildings," 8 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Mr. Charles E. Keyser, F.S.A., on "Sculptured Tympana of Norman Doorways," 8 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Prof. R. Elsey Smith on "Building Materials," 7 p.m.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.—Mr. James R. Bell, M.I.C.E., on "Authoritative Rules for Unit-Stresses in Railway Girders," 8 p.m.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

ROYAL INSTITUTION.—Prof. Percy Gardner, Litt.D, F.S.A., on "Greek and Roman Portrait Sculpture"—II. 3 p.m.

CAMERA CLUB.—Mr. A. Burchett on "Light and Shade," 8.15 p.m.

Friday, March 8.

ARCHITECTURAL ASSOCIATION. — Special General Meeting to Consider the Committee's Scheme for the Establishment of Day Class, 7.30 p.m.

PHYSICAL SOCIETY.—Meeting at 5 p.m.

GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. James Lochhead on "The Decay of Building Materials," 8 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. Arthur T. Bolton on "Some Thoughts on Planning," 6.45 p.m.

ROYAL INSTITUTION.—Mr. W. A. Shenstone, F.R.S., on "Vitrified Quartz," 9 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Professor T. Roger Smith, F.R.I.B.A., on "Sanitary Building Construction and Planning; Soil and Local Physical Conditions," 7 p.m.

INSTITUTION OF CIVIL ENGINEERS (Students' Meeting).—Mr. Charles Johnston on "Sewage Treatment," 8 p.m.

Saturday, March 9.

DUNDEE INSTITUTE OF ARCHITECTURE.—Mr. Charles G. Soutar on "Ecclesiastical Architecture in Fifeshire," 7 p.m.

INSTITUTION OF JUNIOR ENGINEERS.—Visit to the Southall Station of the Brentford Gas Company to inspect the Carburetted Gas Plant, Inclined Retorts, &c., at 3 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Archers' Hall and Craigmillar Park United Free Church, Edinburgh.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at Beddington Sewage Farm at about 3 p.m., conducted by Mr. Thomas Walker, M.I.C.E.

Monday, March 11.

SOCIETY OF ARTS (Cantor Lectures).—Major P. Cardew on "Electric Railways"—I., 8 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. W. C. Tyndale, M.I.C.E., on "Ventilation, Warming and Lighting," 7 p.m.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

PHILOSOPHICAL SOCIETY OF GLASGOW: ARCHITECTURAL SECTION.—Meeting at 8 p m.

BRISTOL SOCIETY OF ARCHITECTS.—Mr. Archibald Dawnay, A.M.I.C.E., on "Constructional Steelwork as Applied to Building," 8 p.m.

Tuesday, March 12.

SOCIETY OF ARTS (Applied Art Section).—Mr. Hugh Stannus, F.R.I.B.A., on Some Examples of Romanesque Architecture in North Italy," 8 p.m

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. W. C. Tyndale, M.I.C.E., on "Calculations, Measurements and Plans of Sections," 7 p.m.

Wednesday, March 13.

EDINBURGH ARCHITECTURAL SOCIETY.—Mr. J. Stuart Syme on "San Micheli and his Work."

NORTHERN ARCHITECTURAL ASSOCIATION.—Annual Meeting at 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. J. M. Brydon, F.R.I.B.A., on "The Work of Cockerell," 8 p.m.

SANITARY INSTITUTE.—Council Meeting at 5 p.m., Mr. Christopher Childs, M.A., M.D., on "Ventilation: Success and Failures of the Methods at Present in Use," 8 p.m.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at Broake, Roberts and Co.'s Chemical Works, Stratford, at 2.30 p.m.

SOCIETY OF ARTS.—Mr. F. B. Behr on "The Proposed High-speed 'Monorail' between Liverpool and Manchester," 8 p.m.

Thursday, March 14.

ROYAL INSTITUTION.—Prof. Percy Gardner on "Greek and Roman Portrait Sculpture"—III., 3 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Paper by Mr. E. W. Mountford, F.R.I.B.A.

Friday, March 15.

ARCHITECTURAL ASSOCIATION.—Mr. H. B. Measures on "Rowton Houses," 7.30 p.m.

EPIDEMIOLOGICAL SOCIETY.—Dr. J. T. R. Davison on "The Effects of Sewerage and Water Supply upon the Behaviour of Enteric Fever in Buenos Ayres"; Dr. N. P. Schierbeck on "The Enteric Fever Mortality in Copenhagen from 1828–1898," 8.30 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. W. C, Tyndale, M.I.C.E., on "Sanitary Appliances," 7 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. Bulkeley Cresswell on "Registered Architecture: an Analysis of the Society of Architects' Prescriptions," 6.45 p m.

Saturday, March 16.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at the Sewage and Destructor Works, Ealing, at 2 15 p.m., conducted by Mr. Charles Jones, M.I.C.E.

CONTRACTS OPEN.

URBAN DISTRICT COUNCIL of CARLTON near NOTTINGHAM.

TO CONTRACTORS.

The Council hereby invite TENDERS for the ERECTION of NEW ENGINE HOUSE and PUMP HOUSE at Carlton, near Nottingham.

Plans, specifications, &c., can be examined, and form of tender, and schedules of quantities obtained at the office of the Surveyor; Mr. R. WHITBREAD, M.S.A., Carlton, near Nottingham, on payment of the sum of Two Guineas, which will be returned on the receipt of a bonâ-fide Tender on and after FRIDAY, the 1st day of MARCH, 1901.

Sealed Tenders, endorsed "Tender for New Engine House and Pump House," must be delivered at the Office of the Council on or before TUESDAY the 19th day of MARCH, 1901, not later than SIX o'clock p.m.

The Council do not bind themselves to accept the lowest or any Tender.

By order of the Council,
JAS. KIRK CLARK,
Clerk.

Public Offices, Main Street,
Carlton, near Nottingham,
March 1901.

NORTON SCHOOL BOARD.

TO BUILDERS AND CONTRACTORS.

The Norton School Board invite TENDERS for the whole or any portion of the works required in the ERECTION of a NEW SCHOOL at Norton Lees.

Persons desiring to Tender are requested to make written application to Mr. JOSEPH NORTON, Architect, Alliance Chambers, George Street, Sheffield, on or before TUESDAY, the 13th MARCH, 1901, accompanied by a deposit of One Guinea, to be returned to those who submit a bonâ-fide Tender in the manner and at the time specified.

The Board does not bind itself to accept the lowest or any Tender, and no allowance will be made for estimates.

Tenders will only be received on the printed forms and in covers to be obtained from the Architect, and must be delivered at my Office not later than the 25th MARCH next.

SAMUEL ALLEN,
Clerk to the Board.

20 Bank Street, Sheffield,
February 1901.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

March 13, 1901.
No. CCCXVIII.

Effingham House,
Arundel Street,
Strand, W.C.

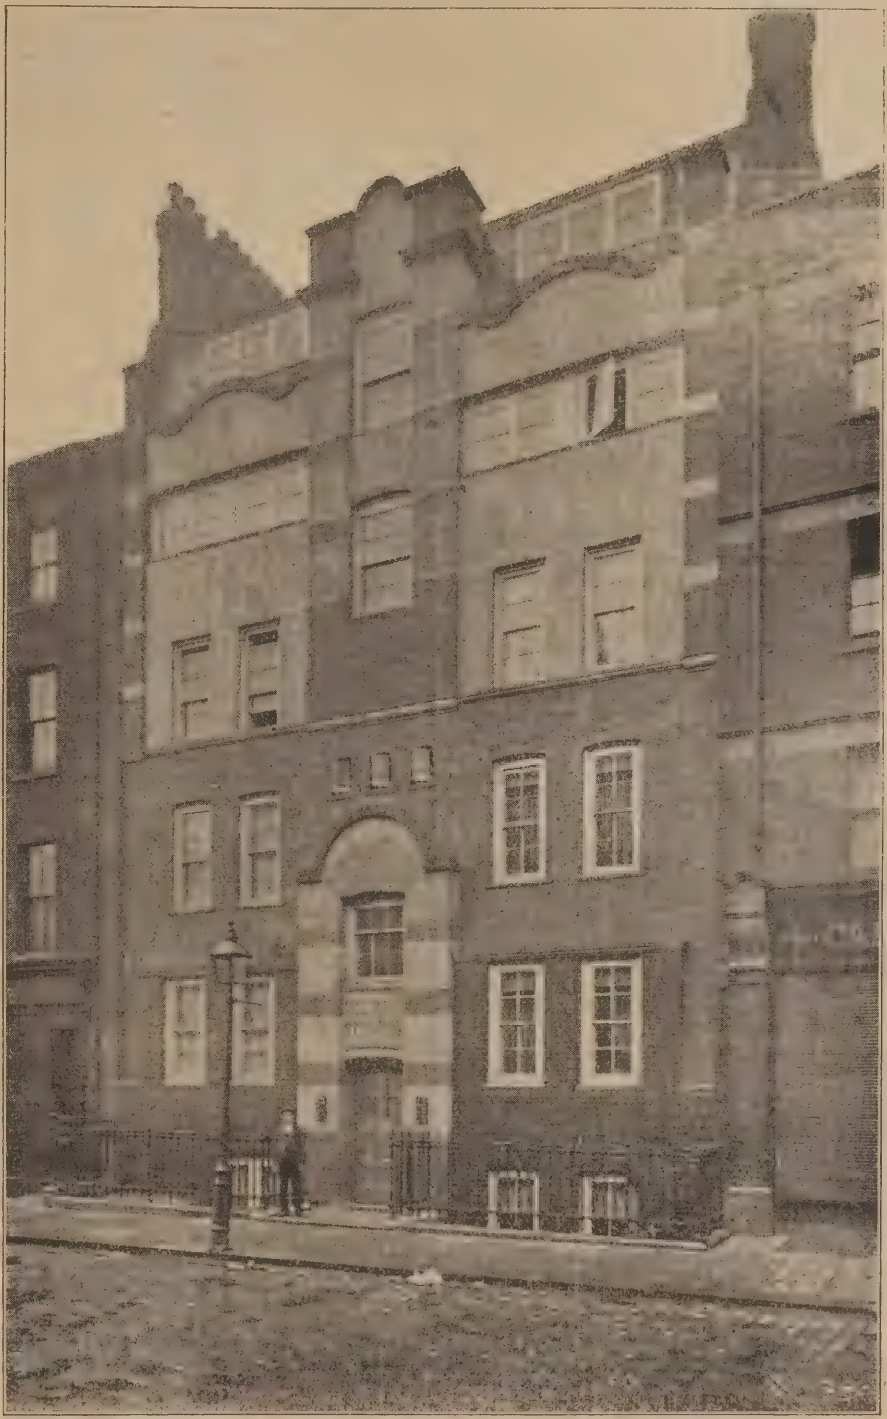
An Architectural Causerie.

To Our Readers. We have to inform our readers that the proprietorship of this journal has changed hands, and that several important alterations will shortly be made. Of these we can say no more at present than that they will add considerably to the interest and value of the Builders' Journal, and we must ask our readers to wait till next week for full particulars.

Belmont House, Candover Street, W. This house, named after the battle of Belmont, has two self-contained flats on each floor, comprising entrance lobby, sitting-room, bedroom, kitchen and the usual offices, with coal cellars in the basement. The elevation is in buff-coloured salt-glazed bricks, Portland stone, red and blue Staffordshire bricks, and green and brown cement work, the whole of the joinery being painted white. The building was carried out by Mr. A. A. Webber, contractor, of 47 Mortimer Street, W., and the sanitary and drainage work by Messrs. Thomas J. Boulting and Sons, of Union Street, W., the whole being completed under the supervision of the architects, Messrs. H. Fuller Clark and Percy A. Boulting, of John Street, Bedford Row, W.C.

Newport Castle. Like many another historical building, the old Norman Castle of Newport, in Monmouthshire, has passed through many vicissitudes, and now, as a climax, it is to come under the hammer. For many years it has been used as a brewery, a piece of vandalism only equalled by the neglect which the Corporation have shown in regard to the whole site. The castle dates from about 1130, and is of sufficient merit to warrant every care being taken for its preservation, but with wanton heedlessness the Corporation allowed it to be used for the ignominious purposes of a brewery, and at one time even permitted a large music-hall signboard to flaunt itself across the top of the keep. Newport Castle abuts on the river Usk, to which it lies parallel, and there was formerly a space in front of it which should have been preserved as its grounds, thus providing a proper setting for the building and forming a pleasant green place in the centre of the town. Now there is talk of the Corporation buying the castle, but it is rather late in the day to think of this, for they have permitted the surrounding ground to be so covered with hotel and commercial premises that the old Norman stonework almost touches the new red brick—in fact to no small extent the castle is dominated by the new buildings, and though its river front remains untouched the other portions are hidden away. Nowadays many are prepared to pooh-pooh the person with any trace of artistic perception, but here is a case in point where the lack of it has resulted in a fine and interesting Norman castle being treated in the most disgraceful manner.

The Architect of Everyday Practice. Instances are constantly recurring of the decay which sets in when the architect is becoming settled in his practice, a decay which is the almost inevitable result of contact between modern commercialism and the art of architecture. In their younger days architects are all afire with the endeavour to catch the spirit of the old masters: they sketch and measure, examine and compare, and dream of the time when they shall be the happy creators of noble buildings. But little by little the image becomes blurred, and what was first seen with clear vision—a strong demarcation between good work and bad—becomes increasingly obscured by the shadow of practicalities. True, business is business and a man must live; but it is much to be regretted that so many architects who showed promise in their youth should, when they settle down in practice, throw over their early ideas and become slaves to a purely commercial creed. Architecture is changed from a profession of truthful building to a sluggish system of trade. We do not wish to appear unreasonable or unobservant of the practical requirements of to-day, but we deplore that it is so common to find the true zeal gone when the architect nears middle age—or before. Perhaps some reason for this may be found in the fact that many men seem to think that their education is over when once they start in practice: they are then the finished product. No greater mistake could be made. It is at this period that the opportunity offers of carrying into effect motives which actuated the early enthusiasm. The Royal Institute includes among its members dozens of men with large practices whose buildings dishonour the name of architecture; and though the decay to which we have referred is certainly not entirely responsible for this, still a great improvement would have been effected had these men not degraded their art when actually engaged in practice. When architects have the courage and capacity to deny the right of "commercial needs" to cripple their art, then we shall have more numerous examples of good building.



BELMONT HOUSE, CANDOVER STREET, LONDON, W.
H. FULLER CLARK AND PERCY A. BOULTING, ARCHITECTS.

THOMAS H. MAWSON.

SMALL GARDENS.*

By THOMAS H. MAWSON.

WHEN your secretary asked me to read a paper before you he suggested that I might deal with one of the many subjects touched upon in my recently-published book, "The Art and Craft of Garden Making." Knowing something however of architectural practice in the Midlands and the revival of interest in the planning of small houses, and realising that in some ways my book (owing to the exhaustive number of topics) must of necessity be brief and concise, I did not deal very fully with gardens suited to this class of house, and I thought my paper would be much more useful if confined to the treatment of gardens surrounding cottages and small houses.

One of the most pleasing signs in the architect's profession is the recognition of the fact that cottage architecture to be truly successful cannot be confined to the planning and designing of the house and elevations; but must have some control over the interior decoration (or what is oftentimes better the avoidance of decoration); and with the design and arrangement of the furniture; the control of the approach to the house and also the garden, or at any rate that portion of the garden which immediately surrounds the house. I am afraid that in many cases the bare recognition of, or assent to, this principle suffices, and that whilst we see here and there sparsely distributed signs of the approaching architectural millennium, we are not quite there yet, and I fear that some of you, when I suggest the addition of a technical knowledge of garden-making to the already long list of subjects through which you have to conduct your studies, will almost hope that I do not succeed in proving my case, and yet I can promise that if I succeed I shall introduce you to a subject which shall yield you greater delights than any you have yet tasted in the field of design; and I may add to the younger members of the profession, that you will soon realise that to a very large extent it is a mine which has not yet been fully worked or explored, one where you can within certain limits express the completeness of your own ideas, and determine what character of design shall rule in the making of a garden. I agree there are greater drawbacks and discouragements to encounter in the garden than in the house and its interior arrangements or fittings, as so much more depends upon the aptitude and intelligence of the gardener who is to put your ideas in practical shape (a very worthy man in himself according to his light and his training, but whose ambition is often measured by the local Flower Show exhibits) than upon either the builder, decorator, or furniture maker whom you can restrict and restrain and guide by plans, details, designs, or sections.

To make myself quite clear I may say that the cottage residence which I have in my mind would range from the small £40 semi-detached, with its plot showing a frontage of 60ft. and a depth of 100ft., to the small house with three entertaining rooms and six or eight bedrooms, stabling for two horses, and two acres of ground.

Before I proceed to give you a few hints which I hope you may find of a practical character I wish to show, first that you cannot really successfully plan a cottage residence without deciding the principal features comprising the garden scheme. The designer of the cottage ought in any case either to design the complete garden scheme, or otherwise agree to allow of an exchange of opinion between himself and whoever may have to plan and carry out the garden. Even supposing the landscape gardener to be an artist with insight into, and in full sympathy with, true architectural dignity and expression, the architect has much the best opportunity of making a successful and complete plan. I also wish to show that if the architect does not undertake the designing, the landscape gardener in all probability would not be asked to do it, and that as a consequence the garden setting to the house, over which so much time and thought had been spent, would eventually be the joint production of the local jobbing gardener and the client.

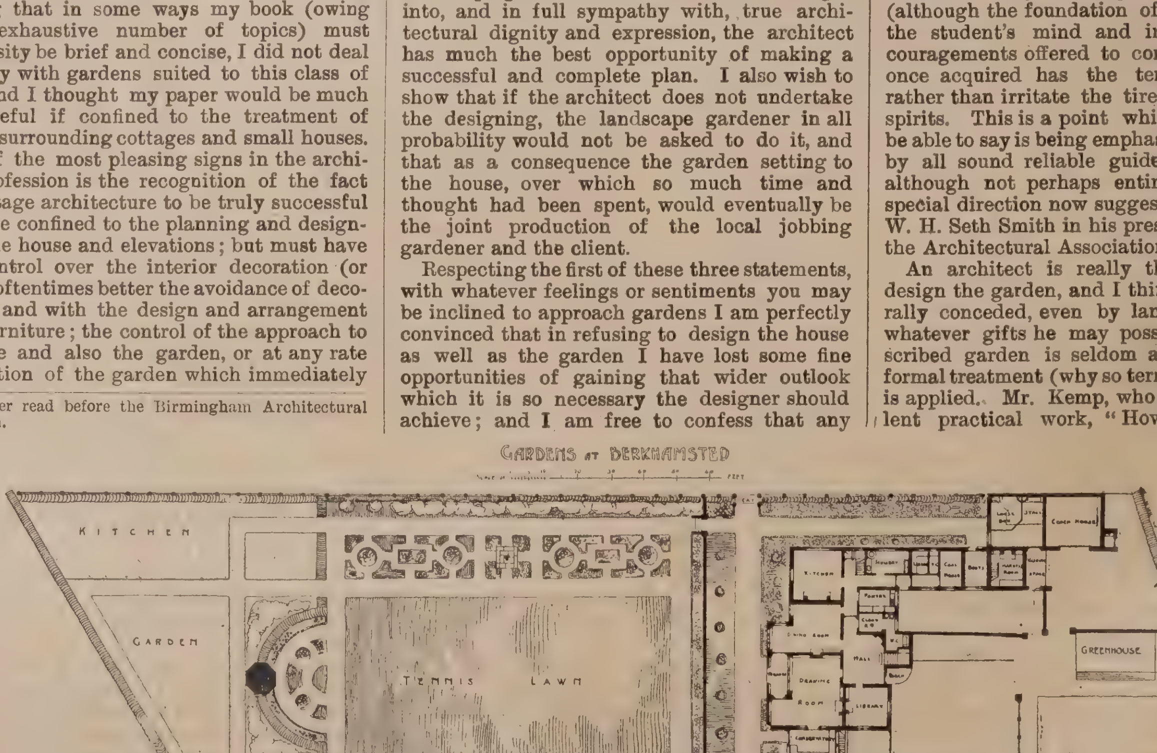
Respecting the first of these three statements, with whatever feelings or sentiments you may be inclined to approach gardens I am perfectly convinced that in refusing to design the house as well as the garden I have lost some fine opportunities of gaining that wider outlook which it is so necessary the designer should achieve; and I am free to confess that any grasp which I may have of this principle of unity and completeness, which should rule not alone in gardens and house but should underlie the character of the whole street—nay! of the whole city. I say then that this habit of viewing scenes in their broader aspect has largely resulted from the fact that I have been brought into connection with a considerable number of clients who, having purchased their site years before they were prepared to build, or even to consult an architect, have nevertheless wished to do the necessary planting, and in some cases to lay out the outer fringe of the gardens. I have thus been compelled to consider the place as a whole, and to plan the houses in a way which I thought would best suit the site and my client's probable requirements. In this way I must have prepared scores of plans for houses of all sizes, and I can assure you it has been a fine study. My reason for venturing this personal experience is because I feel that I am quite right in saying that it is just as necessary for the architect to realise the proper connection between house and garden as for the garden designer to obtain a grasp of the character of the design and the planning of a house. I need only emphasise this by pointing out that the approach to a house, whether in the form of a drive, avenue, a simple court or merely a walk, is the first impression a visitor gains; it is generally the most important detail in the garden scheme, and is at the same time the introduction to the house itself.

In passing I would like to mention another great factor which combined with others has tended to broaden my vision and educate me to look beyond merely limited prospects; it is the laying-out of building estates where the desired aim and object was to accomplish a worthy complement to pure air and pleasant surroundings without desecration and disfigurement; yielding pleasure to the beholder and profit to the proprietor. Architects who wish to lay out gardens would do well to cultivate this faculty of studying nature with a view to the attaining of aggregate effects; a grand antidote against mere sleight-of-hand draughtsman proficiency and commonplace invention, and against a too pedantic academical education. I am well aware of the ever-increasing amount of subjects that a modern architect has to keep pace with, but this faculty is in a great measure intuitive (although the foundation of it may be laid in the student's mind and incentives and encouragements offered to continue), and when once acquired has the tendency to soothe rather than irritate the tired brain and jaded spirits. This is a point which I am pleased to be able to say is being emphasised and reiterated by all sound reliable guides in architecture, although not perhaps entirely in the exact special direction now suggested, notably by Mr. W. H. Seth Smith in his presidential address to the Architectural Association.

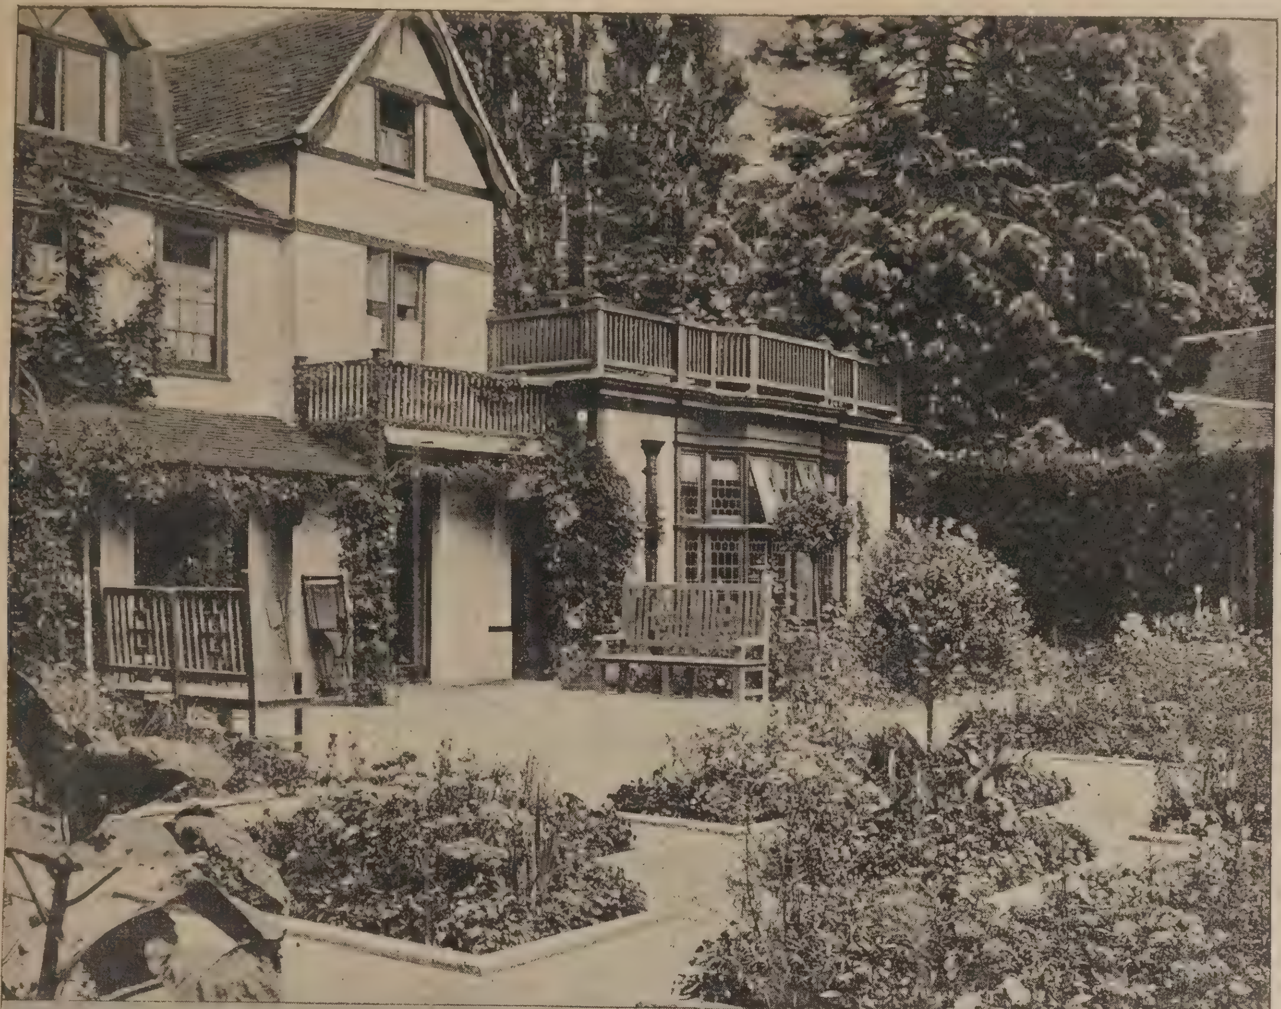
An architect is really the fittest man to design the garden, and I think it will be generally conceded, even by landscape gardeners, whatever gifts he may possess, that a circumscribed garden is seldom a success unless a formal treatment (why so termed I do not know) is applied. Mr. Kemp, who wrote that excellent practical work, "How to Lay Out a

---

* A paper read before the Birmingham Architectural Association.



PLAN NO. 1.

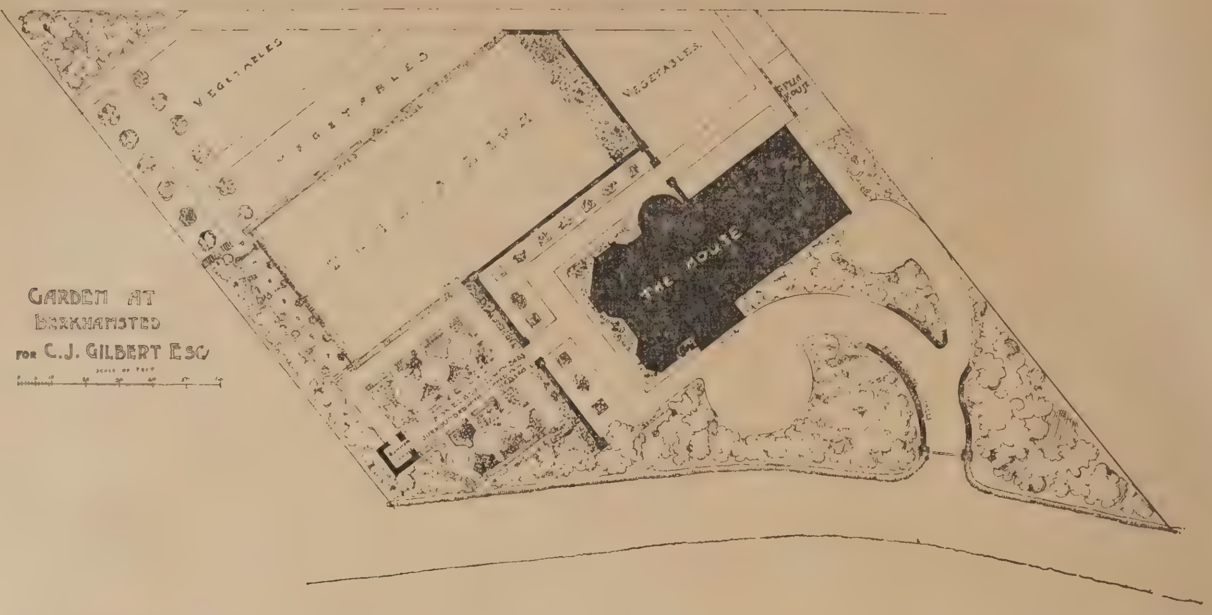


PAVED GARDEN COVRT AT WRAYSBVRY FOR G.M. FREEMAN. ESQ. Q.C.

Garden," realised this. The advantage of this method is that the garden design is brought into direct relation with that of the house; that in fact a garden becomes a necessary outdoor extension of the family requirements and of the entertaining arrangements: one set of apartments under cover, the other open to the interchange of shine and shower and of each season's respective display. The relation of this series of garden apartments to the house would be more ably grasped by the person who had planned the house and knew the relative use of one room to another. The ingenuity necessary for the planning of the house would assuredly find larger liberty and unfettered scope in controlling the whole. An architect occupies a much better position than either the landscape gardener or anyone else to realise a successful garden; for if he had to be responsible for the whole he would take care that the only place in which a Maréchal Niel rose would grow is not occupied by the basement area, that the steps to the beer cellar do not cut into the only piece of ground suitable for a flower garden, and that the coal shute is more than 3ft. from the door of the principal entrance; also that the garden front was as far removed as circumstances would allow from the entrance front, and that the kitchen offices and stables (whilst helping the general effect) were so placed as to allow them to be screened from the private parts of the garden. But perhaps the greatest advantage which the architect possesses lies in the fact that he has the control of the entire sum which his client is prepared to spend. I happen to know from experience what this means, for time and again have I found, when called in to advise, after the house was partly completed, that the balance available for laying out the garden was totally inadequate for the purpose, with the consequent result that the garden was in a large measure a failure. When interests are divided one is prepared for this kind of thing; but if one realises that half of the money spent on, say, the barge boards, finials and bristling insincere ornamentation would have given you some chance in the garden, one cannot help regretting the absence of some controlling mastermind who, with perfect unanimity of purpose and comprehensive grasp, had had the spreading of the money over the larger area. Now do not misunderstand these remarks, for I quite sympathise with the architect who must have realised that in the incapable hands of the jobbing gardener, who in no wise conceives the house and garden as one composition, the less money allowed for the garden the better, and that it was much better to make the barge board a counter attraction to the monkey-puzzler so carefully planted in the little circle in the centre of the carriage turn. The last consideration under this heading is that if you do not undertake the work it will fall into incompetent hands; or if a competent designer is engaged by the client it is in the majority of cases because he has a reputation for a set form of garden design or speciality which, however advisable under the most favourable conditions, may be totally out of place here, but which the proprietor is persuaded, as mankind are by the foibles of fashion, is the only correct form under all circumstances, and which, unless the architect can prevent, he is determined to have. There is more than one garden designer in this country who has realised the inconvenience of a prevalent fashion brought about by the dictatorship of some temporary popular, bumptious capability Brown, and the expressed disappointment of his client when he proposes to treat the ground in a manner characteristic of the surroundings. Architects, it is understood, in dealing with the ground are not expected to conform to a set of ideas which are well known to be foreign to their profession.

Having given you my reasons why you should undertake the designing of small gardens I now wish to state a few necessities and qualifications. In the first place a proper survey with accurate levels is needed, and I can assure you that you will need to lay out a very large number of gardens before you can dispense with this necessary operation, even to the extent of making a preliminary sketch; for to be in any way successful the plan must be arranged to fit the ground and give expression to its contour. You must also be able to judge when ground requires draining, and, having decided upon this necessity, be able to arrange it in an efficient and economical way. Judging from many schemes which I have seen for dealing with surface water I am inclined to think that you could easily spend on land draining a sum large enough to lay out in a satisfactory manner the whole of the ground. You must know a little about soils; this is a question which troubles would-be garden designers greatly. Now for the horticulturist pure and simple; this is a most important branch of study and research, but for the garden designer there are a few sound rules which will meet his requirements whether the soil is wet or dry, light or heavy, clay or gravel subsoil; whether the soil lies on limestone or in chalk. If the soil is wet, good drainage should remedy it; if clay good drainage and the admixture of burnt clay and town refuse. Good trenching will usually be beneficial if light and sandy, with an admixture of clay or cow manure; as a rule however you may say that a dry subsoil is best for a garden.

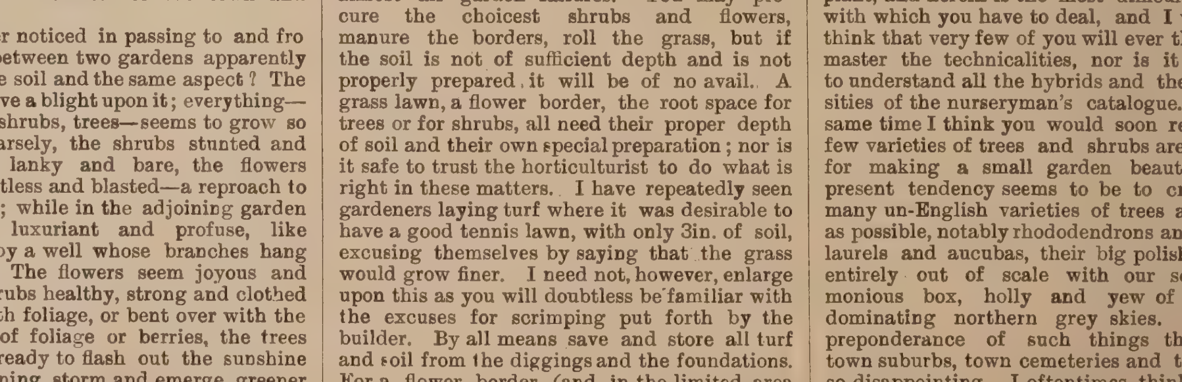
The first great desideratum is unity and cohesiveness, some great controlling power to marshal and organise the petty clevernesses, talents and gifts, and make for and lead up to one ultimate end. The lack of this quality makes 99 out of every 100 cities so disappointing when viewed from an eminence—such a motley jumble of points, angles and pinnacles, style and no style. Almost all our national, municipal and parochial energies and aims lack this socialistic quality; there is abundant individual clever-



ness. But of all matters, says some one, do not interfere with the liberty of the subject in his garden. That certainly is not my motive, but I would by all the powers of persuasion try and induce the subject to use his liberty not merely to the gratification of his individual preferences, but to a certain extent to sacrifice these to obtain an aggregate effect. For instance, a fortunate possessor of a house in a city or suburb where vegetation is none too abundant and brick and stone largely predominate, with a fine walled-in geometrical garden faultlessly laid out with neat box-edged beds, vases, and all that goes to make such a garden a success. But in taking a summary view of his surroundings his eye longs for some counterbalancing mass of green, and to remedy this he sacrifices a part of his garden, and plants a mass of hollies, or limes, or beech to tower above the boundary wall to the gain of the outside beholder, the public, and at a loss to himself—that man is a benefactor to the town and neighbourhood.

Have you ever noticed in passing to and fro the difference between two gardens apparently having the same soil and the same aspect? The one seems to have a blight upon it; everything—grass, flowers, shrubs, trees—seems to grow so tardily and sparsely, the shrubs stunted and starved, trees lanky and bare, the flowers shrivelled, scentless and blasted—a reproach to its neighbours; while in the adjoining garden everything is luxuriant and profuse, like fruitful trees by a well whose branches hang over the wall. The flowers seem joyous and radiant, the shrubs healthy, strong and clothed to the roots with foliage, or bent over with the added weight of foliage or berries, the trees healthy, ever ready to flash out the sunshine after the darkening storm and emerge greener and purer; the ivy, clematis, honeysuckle, jasmine and roses peep in at the windows and flower in picturesque masses; the grass does not cake or languish and burn in drought, but yields to the eye that refreshing, restful, compact aspect so desirable. But what is the reason for this contrast—this difference? You would be able to tell me almost at once if there were two adjoining houses in a correspondingly opposite condition, both apparently built with the same hand and with a corresponding amount of care; the one looking singularly happy, "suitably received into the bosom of things" as some one has said, the other, in spite of suitable window adornments and owner's care, decrepit and unhappy. Your trained eye would at once glance at the unlevel joints, the slightly irregular ridge finials and chimneys and other lines slightly out of the perpendicular—points scarcely discernible to anyone else—and you pronounce the verdict "bad foundation." This foundation failure—unprepared soil—is the cause of almost all garden failures. You may procure the choicest shrubs and flowers, manure the borders, roll the grass, but if the soil is not of sufficient depth and is not properly prepared it will be of no avail. A grass lawn, a flower border, the root space for trees or for shrubs, all need their proper depth of soil and their own special preparation; nor is it safe to trust the horticulturist to do what is right in these matters. I have repeatedly seen gardeners laying turf where it was desirable to have a good tennis lawn, with only 3in. of soil, excusing themselves by saying that the grass would grow finer. I need not, however, enlarge upon this as you will doubtless be familiar with the excuses for scrimping put forth by the builder. By all means save and store all turf and soil from the diggings and the foundations. For a flower border (and in the limited area devoted to flowers in most suburban gardens the expense would not be great) it is a good plan to lay at a depth of about 2ft. a layer of broken brick or some absorbent material, provided that the soil-water drainage-level is deeper; then to overlay this with a covering of ashes, and then to overlay this to a depth of about 21in. with soil of desirable lightness; if too heavy it should be mixed with sand and should have abundant vegetable matter and fibre in it, such as the decayed turf which close-grown pastures yield. For trees and shrubs a depth of from 1½ft. to 2ft. is needed, with a plentiful admixture of the fibrous turf loam, though it need not be so richly manured as the flower border. Grass also requires a depth of soil not less than 3in., with a well-drained bottom properly prepared. Of course, as before stated, different soils, heavy or light, clayey or sandy, require different treatment; but although the first outlay may be greater, it is cheapest in the end. "Prevention is better than cure."

Of course it is necessary to know what to plant, and herein is the most difficult problem with which you have to deal, and I venture to think that very few of you will ever thoroughly master the technicalities, nor is it desirable to understand all the hybrids and the monstrosities of the nurseryman's catalogue. At the same time I think you would soon realise how few varieties of trees and shrubs are required for making a small garden beautiful. The present tendency seems to be to cram in as many un-English varieties of trees and shrubs as possible, notably rhododendrons and common laurels and aucubas, their big polished leaves entirely out of scale with our sober harmonious box, holly and yew of the predominating northern grey skies. It is the preponderance of such things that makes town suburbs, town cemeteries and town parks so disappointing. I oftentimes think that the quiet spacious dignity of the Harrogate Stray would be preferable to many of the tortured



hillocky, unnaturally-planted parks nowadays so common.

In the few architects' gardens I have seen I notice that they usually plant shrubs, both formal and others, in the grass, evidently expecting them to thrive as they do in properly prepared and tilled borders. This is a mistake, and for several years at the least, until the shrubs are thoroughly established, all grass and weeds should be kept clear of their roots. I know how much better grass looks when it sweeps up to the stems and trunks of the trees, or the leaves and boughs fall over in a fringe upon the sward. How difficult it is to convince clients of the dignity of mown grass, and how often do we see the majestic trunks of a fine group of cedars or timber trees muddled up with the inevitable fussy rhododendrons.

It is in the direction of flowering plants rather than shrubs that variety is to be sought after, and for these you must, I fear, rely upon the nurseryman's knowledge of things, simply controlling the shape of the beds and borders in which they are to be planted, and, perhaps the passing of the few varieties which are essential to the architect's garden, some of which I will enumerate later.

Now, respecting the planting of hedges, screens, &c. Before you attempt to do anything satisfy yourself that what you plant will grow. You may wish for a yew hedge, but it may grow so indifferently in the neighbourhood that you would get more effect out of common privet. Having made up your mind as to the character of the shrub or tree you wish to plant you will find it comparatively easy to discover whether or not it will grow in the neighbourhood, and, if not, what would form the best substitute.

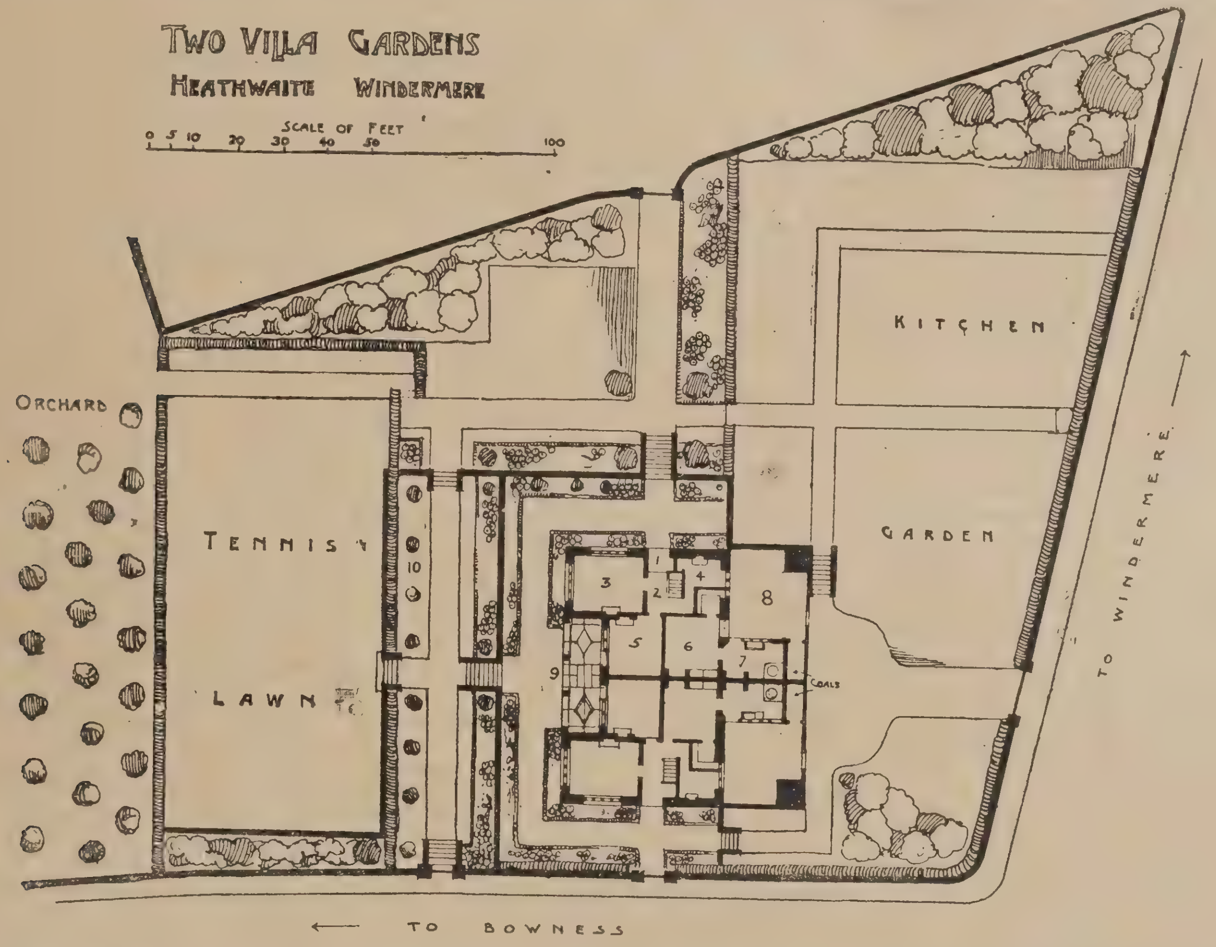
But before we discuss any more technical difficulties we had better consider broad principles, which it is necessary to grasp before arranging your garden plan. I have already stated that the controversy which has been waged between garden designers and architects does not apply to small gardens, for all are agreed on the general principle of formality, although not agreed as to the detail by which this formality should be expressed. The aim and purpose of a small garden are totally different from gardens of large extent—the former expresses the sympathies, pursuits and refinements of the home life; the latter, in addition to this, is first and foremost a mark of rank and opulence. The managing head-gardener in the one case is the master or mistress of the house; presiding over the other is the skilled horticulturist, whose permission my lady must ask before she may cut a flower. The small garden is probably the only form of rural pursuit open to its owner, and yields in relaxation and reflection a delightful change to the "sturm and drang" of his everyday existence.

In a garden there are so many things which are considered necessities, some beautiful in themselves, others difficult to classify, adorn and harmonise with an all-pervading sense of true garden effect. There are the tennis lawn and summer-house; the rose border, where too often size of flowers seems to be the chief attainment—lanky bare sticks—during more than half the year, the roots covered with untidy manure, from which the eye instinctively turns to find delight in the rich green of the despised herb border of parsley and sage. The greenhouse, where can be grown geraniums and decorative house-plants in winter and in spring, where one can grow tomatoes in the summer and show chrysanthemums in the autumn. The little garden frame, which ensures a supply of sweet violets throughout the winter months; a potting shed also and garden house, and a paved shed with a big block for chopping firewood, when from stress of weather the proprietor has nothing else to do; in fact, so many interests are to be catered for in this class of garden, and such a host of details on which you can exercise your ingenuity for garden effects, that to the man of sense and refinement make-believes become grossly irritating. What he wants is a purpose-like garden.

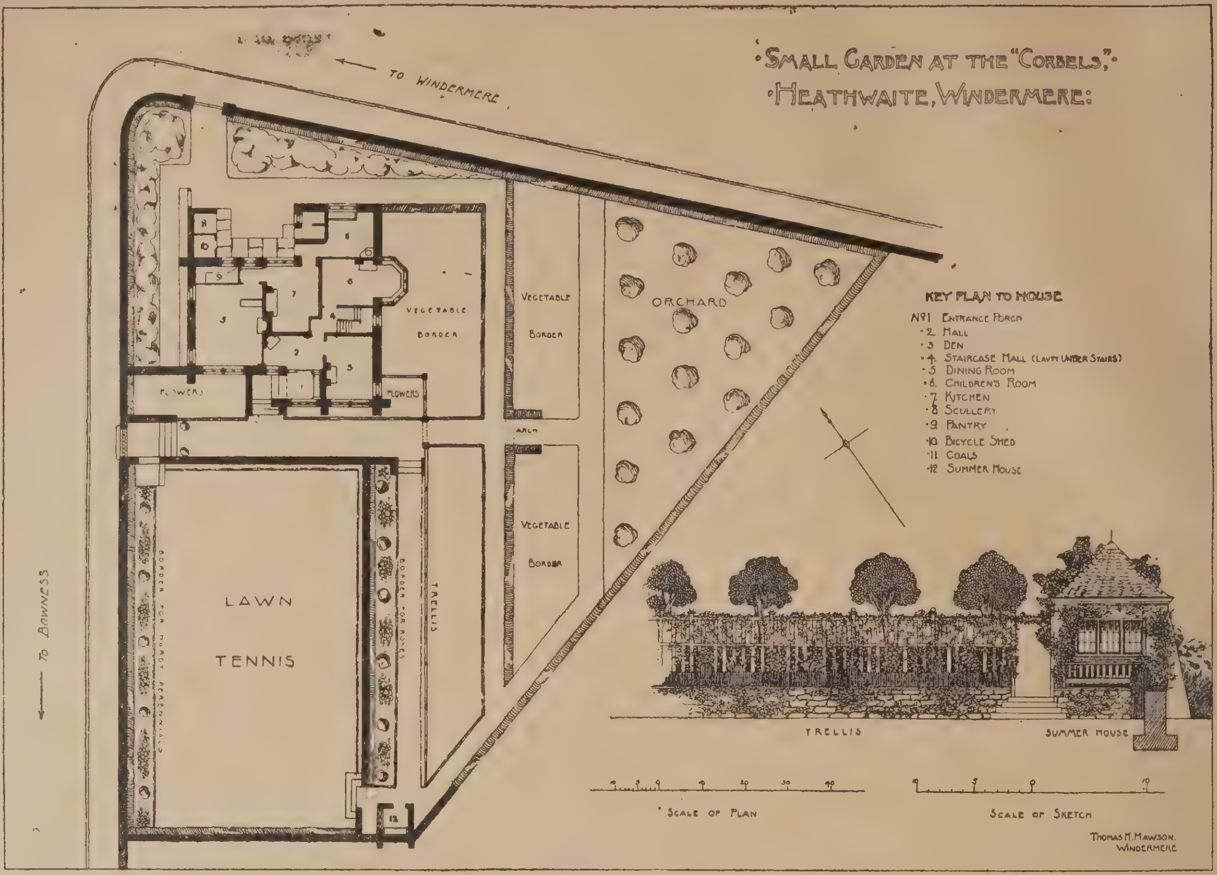
There are two considerations I would like especially to impress upon you. First, the desirability of disabusing your mind of your preconceived notions of the art which is said to conceal art, and, on the other hand, the value of plain surfaces and of definite unhesitating lines. In ignoring the latter it is quite true that you may be able to cover your lawn with trees and shrubs from every part of the temperate zone, just as you may fill your drawing-room with all sorts of bric-a-brac; in both cases you may, instead of securing a sense of restfulness, succeed in obtaining an aspect of fussiness. In laying out definite lines you may not get quite so many of those little surprises so much sought after in gardens, and you may not even be able by the exercise of a little trick or two to make your neighbour's garden look as if it belonged to you, but you will be saved the humiliating knowledge that your garden is a fraud and that your visitors are sure to find it out.

So much depends upon locality, materials available, the importance of the house and the amount of money at your disposal, that the question of fences cannot be profitably discussed in this paper; but I would like to say that split oak, which lends itself to such a variety of treatment, is at once one of the simplest and at the same time one of the cheapest forms of fencing; and I would suggest that if we could in this country use in conjunction with this fence the trained lines of limes and laburnum as they are used in Holland and France, we could obtain some delightful effects.

Holly is, of course, an admirable hedge shrub, so are beech and thorn, but in each case the wished-for effect is slow; privet makes a hedge very quickly, but it must be out of the reach of horses and cattle, which are very fond of it. The fence which is least permanent, and least desirable, is the strained wire or iron hurdle. We may now consider more fully the placing of the house on the ground so as to make the most of it. Where the extent of ground is strictly limited, as is invariably the case when you are building a small house, the greatest mistake you can make is to cut up the ground too much with drives, &c. This point cannot, in my opinion, be too strongly insisted upon. If your site is well chosen, the public highway will be along the west, north, or eastern boundaries, preferably the north; and just as you would, for the sake of aspect, arrange your living rooms from east to west, so you should see to it that you have as much land as possible on these sides. Now I hold an opinion which I must admit is at the present time, even among architects, very unpopular—namely, when the plot does not exceed, say, two acres drives are seldom needed, and every real require-



TWO VILLA GARDENS
HEATHWAITE WINDERMERE



PLAN NO. 2.

ment can be met by a simple carriage court, connecting directly with the high road. This court you could probably enclose and pave for a less sum than you would otherwise spend on the drive. If the stable could be arranged to the west side of this court and the small kitchen, garden and kitchen offices also arranged to this side, you would then have all the more ground at your disposal on the sunny side of your house. Plan No. 1 will give you some idea of the effect which can be obtained by a simple square court such as I have advised. Where the plot of ground is less than half an acre it will be seldom that even a carriage court can be arranged with advantage, but it would be comparatively easy to give examples in which the court arrangement will be the making of the place. On the other hand there is no court or drive to the house shown on plan No. 2. Where a drive is really necessary make it as direct as possible. If the ground is fairly level and the junction with the main road is convenient, a straight road treated as an avenue would give the best effect; but if the ground is rising and of irregular contour, then perhaps a curved drive would be the only one possible. There is something very pleasing in following the sweeping lines of a drive or walk encircling the base of a natural knoll or mound, and this has probably led one section of the modern landscapists into manufacturing hillocks and mounds in order to multiply the curves and wriggles.

Above all things do not make your gardens too large; remember that perfect keeping is the soul of a small garden. I can assure you that you will have considerable difficulties with your clients on this score. Find out if you can what labour your client intends to employ: if a man only two days a week, a quarter of an acre would be sufficient; if he can employ a man and a boy the garden might be as large as one and a half acres, or if no glass, as much as two acres. You ask, What shall I do with the remaining portion? If you have sufficient for a paddock for the pony you could not put it to a better use, and in any case you can never go far wrong in planting an orchard; in fact, I always look upon an orchard, with its grass from late winter to spring, broken up with colonies of snowdrops, crocuses, and daffodils, the trees in spring covered with masses of bloom and later the boughs bending under their rich load of fruit, as the most delightful part of the garden. You also invariably require to plant for screen and shelter, and this alone would reduce the amount of ground to be kept under cultivation. There is also the arrangement of the wilderness or wild garden—a piece of ground planted thickly with silver birches, beech, oaks, and Scotch firs; hazel, dogwood, the spindle tree and the savin, with spaces left for daffodils, wood hyacinths, foxgloves and Solomon's seal; having a meandering path running through it or (which I think still better) a broad grass path with heather, vaccineums, mahonia, gaultherias, and other suitable flowering shrubs forming a border on either side; or if very much shaded, with masses of fern or bracken on either side.

If your site has been well chosen, the ground will slope away from the house; if it does so in a southerly direction you will have a very sunny garden. This fall of ground suggests terracing, an operation which in a suburban district requires much more careful arrangement and adjustment than would be the case in open country, where as a foreground to charming distances the balustrade serves as a frame or setting. In the case under consideration the eye should be induced to rest on the garden. Now, there are, roughly, three ways of terracing —by walls, by grass slopes, and by planted slopes. Of the three, walls are the most satisfactory. A balustrade and expensive stone dressings are seldom appropriate to a small garden, except the house be severely Classic. Terrace walls—maintenance considered—are probably the least expensive, and to my mind should never be built as if they were to remain naked; I can never think of a wall as so many yards super. of Ruabon or Accrington bricks, but as a wall of the most delightful greenery. If you are in a brick country, any good hard brick the colour of which approximates to that of the house would answer; if in a stone country, rough rubble. If possible, the pointing should be omitted so that toadflax, house-leeks, &c., could grow in the crannies. The coping, if dressed, to have very simple mouldings. In the houses belonging to myself and my brother the walls cost under 5s. per yard super., and I think they look just as well as if we had spent three times the money. Grass slopes are practically impossible if the batter be less than 1 to 2, allowing a step of 12in. by 6in.; but whatever batter you adopt for one bank should apply to the whole of the slopes in that part of the garden.

Planted slopes such as the one at Rydal Mount are very charming, but the great drawback is that you have to wait many years for the result. You can, however, obtain a very effective planted slope with mahonia, which if fairly successful will completely clothe the bank in two years, and also by planting *Cotoneaster microphylla*, which would clothe the ground in the same time. The one point to bear in mind when laying out batters is to avoid diminishing lines; as, for instance, when you make a sloping walk at the end from the upper to the lower terrace. In deciding the width of your higher terrace you will need to bear in mind what I have said about cutting off the view of your ground below; do not foreshorten your ground. Nothing gives more character to a garden than the form, arrangement and quality of its grass lawns; and nothing is more refreshing than to look out of your room window on to a lawn perfectly formed and kept. To secure this perfect form is, I admit, a difficult task. I have often felt thankful that a tennis or croquet lawn was considered a necessary part of the scheme, and wherever possible I place this in front of the most important windows, or if it is not possible to so place it, then a pleasing vista may be obtained across it. The terrace next to the house should be treated simply, but with a certain amount of colour from flowers, and should certainly have a border next to the house in which to grow climbers. I am fond of broad paved walks on a terrace next to the house, with a few quaint shrubs either planted permanently in beds or set out in tubs.

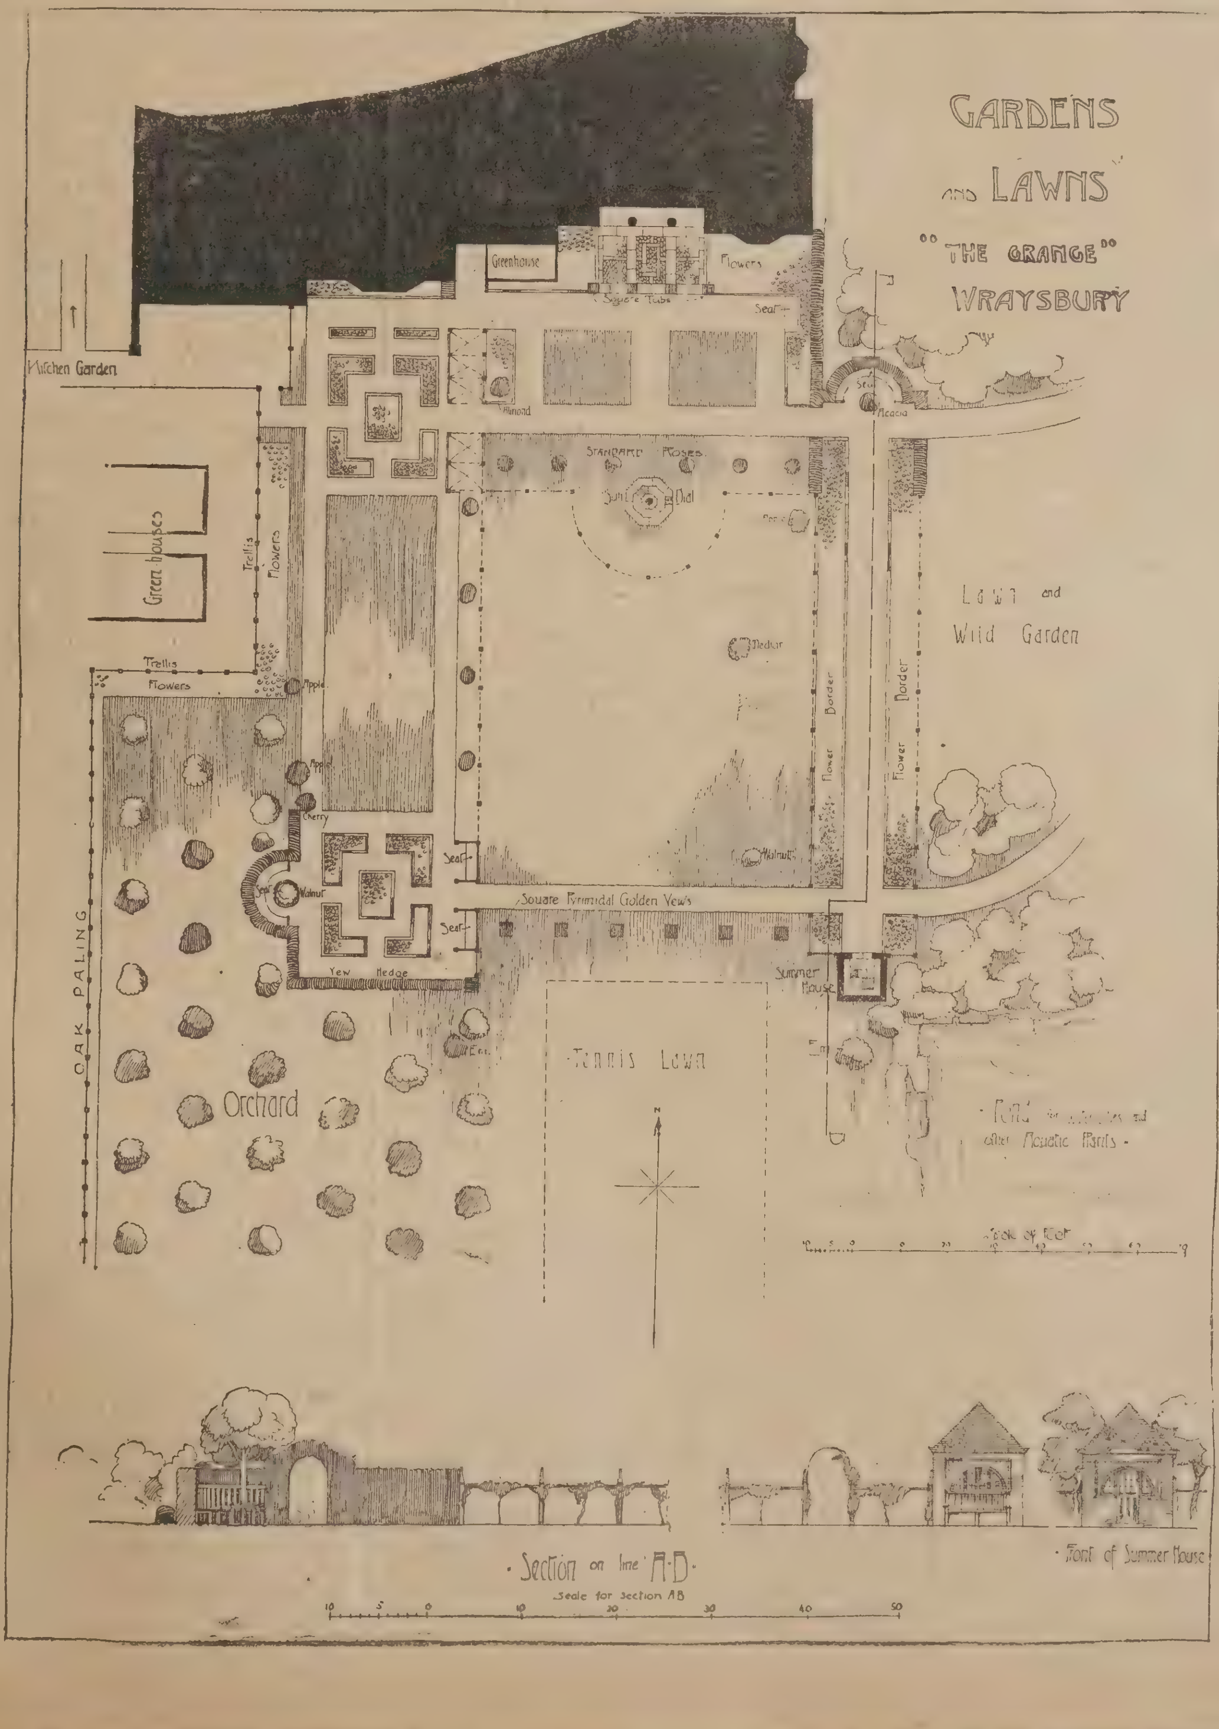
Avoid the usual pattern of broad-brimmed vases filled with lobelia, echeveria and calceolarias; green or oak tubs or big flower pots are far better, if filled with free-flowering green-leaved scarlet geraniums, hydrangeas, or *fuchsia gracilis*; but do not have too many even of these.

If a garden is very small I would advise the flower borders being long and continuous, as in this way you get a much better display of bloom, especially when the borders run outwards from the house. If a summer-house walk can be arched at intervals with honeysuckle, clematis or roses, and the end finished with a seat or other suitable object, with a yew or other snug background, I know of very few garden effects which can surpass the one which might thus be produced.

Small panel gardens such as you would wish to look upon from your entertaining-room window invariably produce the best effect when in beds are of the simplest design and at a lower level than the house. Such gardens as a rule should be perfectly level and have some kind of boundary fence round them; this may be simply a low box hedge, 2ft. high, or a low trellis; in some cases it might with advantage be designed as a sunk garden, with grass slopes and steps at the corners or at each side; if on the same level as the rest of the ground, the flatness might be broken up by having a sun-dial or lead figure in the centre. For breaking up the remainder you might plant golden or common Irish yews, golden hop-headed yews, standard Waterer's hollies, or even standard snowball trees.

According to the measure of exact symmetrical balance secured in the house (though I as a garden designer do not desire to see too many of those square box-like Early Georgian erections so difficult to garden for), so ought the disposition of the features on the terrace to be—grove to balance grove, and tree to balance tree—though not I hope carried to the extent of having a greenhouse on each side of the garden, necessitating two heating operations and two objectionable chimneys, as shown in a recently-published design; such attempts end in the ridiculous. If perfect balance you must have, and if you wish to emphasise this balance by some erection, choose a pair of garden houses, one for use as a tool-house and the other as a summer-house; but if balance is secured by the freer and more picturesque methods adopted by the majority of modern architects of coupling and grouping gables, chimneys, porticos, oriels and the like, balance ought to be secured in the gardens by similarly free measures. You would, whilst securing balance, obtain much greater variety.

One of the most awkward and expensive pieces of ground with which you will at any time have to deal is that in which the house does not follow the natural contour of the ground, but falls slantwise across the garden front, thus giving you a bank of earth on one side which is many feet below the floor level, and on the other side banks of earth standing high above it. I am afraid that in the small plot you have little chance of compromising, but on the larger site, I think, if you had the garden to lay out, you would at times be able to devise some means by which a happier result could be obtained. Where you have a subsoil which is easily removed, such as soft



sand, an alteration to the natural features may be more easily carried out than a modification of the plan of the house.

Although I have a great preference for walls when the ground slopes from the house, I prefer grass slopes when on the south side the ground falls towards the house. In this event an effective garden is very difficult of attainment, and unless very carefully managed you wil succeed in giving a very damp tank-like appearance to the place: the more your ground slopes away from the house the more will you feel the necessity for plantations; but the reverse holds good when the ground falls from north and south towards the house. Bright colours from flowers and occasionally primly-trimmed trees to mark distances if you like, but no general scheme of plantations. If the ground is treated formally you should start with a piece of level ground as wide as you can make it, and, instead of doing the entire break in level in one lift, divide into two or three levels as the case may require, allowing a sufficient width to permit a few flower beds on each.

I have earlier suggested a portion for the kitchen garden, but apart from actual convenience in working I really cannot see much objection to its being placed in any position, provided it can be treated as a part of the scheme. I maintain that some of the most charming gardens I have seen have been kitchen gardens. In Scotland more particularly you will oftener find a beautiful old kitchen garden, which sometimes excels the pleasure garden, and I would not even mind if the living-room window looked right down the central walk.

You will notice that I have hitherto said nothing about the effects which can be obtained by the arrangement of water. My reason for the omission is because there are so few gardens in which, owing to the cost of water supply, this luxury is available. I would point out, however, that a small wall fountain with its one falling spray judiciously placed at the end of a walk or a small circular basin with a central jet are often most charming; even where this is not possible it is often practicable to have a small pond in which to grow water lilies and water hawthorn.

The last detail to which I wish to refer is the planting of the flower borders, in connection with which I may add that I rely almost entirely upon perennials, and those of the hardiest varieties. To go in for what is popularly known as bedding-out is to adopt one of the most expensive kinds of gardening; there are, however, a number of annuals and biennials which are most useful for filling up blank spaces. Amongst these I need only refer to stocks, candy tuft, sweet allysum, mignonette, wallflowers, snapdragons, Canterbury bells, sweet rocket, forget-me-not and pentstemon. I would also allow bunches of scarlet geraniums, heliotrope and verbenas. Amongst the perennials, hollyhocks (single or double), phloxes, delphiniums, campanulas, lychnis, pinks, especially the common white, carnations, tufted pansies and Michaelmas daisies should be planted in groups, the greatest care being exercised to secure effective groupings and continuous show of flowers throughout the greater part of the year, excepting on the outer edge of a border, where a continuous line of one thing (such as pinks) may look very effective. Avoid planting in lines, but rather try to secure a little irregular colony of each plant. If you intend to successfully cope with this most important branch of garden making I would advise you to make the acquaintance of a nurseryman who has a good collection of hardy plants, and to visit his borders once a fortnight.

After all the advice I have given you I can imagine some of you will yet decide that the subject is too big or that the advice has come too late; if so, as one who loves a garden, let me suggest that when commissioned to design a house in connection with which there is to be a garden, you should seek to co-operate with the garden designer from the time you prepare your first 16th-scale plan, and to agree on some mode of treatment of those parts of the scheme where there is an overlapping of interests, and on the successful treatment of which depends in no small measure the success of the whole scheme.

THE SURVEYORS' INSTITUTION.

THE annual dinner of this institution was held last Monday week at the King's Hall of the Holborn Restaurant, W.C. Mr. John Shaw, the president, occupied the chair, and amongst those present were Mr. T. M. Rickman and Mr. Daniel Watney (past presidents), Sir J. F. L. Rolleston, M.P., and Mr. Arthur Vernon (vice-presidents), Sir John Wolfe-Barry, Sir Alexander Binnie, Mr. J. F. F. Horner, Mr. C. J. Owens, Mr. Andrew Murray (City surveyor), Mr. A. E. de Bock Porter, C.B., Mr. H. T. Steward, Mr. J. L. Wilkinson, Mr. D. J. Ross, Mr. G. M. Freeman, K.C., Mr. R. Ellett (president of the Incorporated Law Society), Mr. T. Blashill, Mr. J. W. Penfold (hon. secretary), and Mr. J. C. Rogers (secretary). Lord Brampton, Mr. Justice Grantham, Lord Alverstone, and Mr. W. Emerson (the president of the Royal Institute of British Architects) were unable to attend, and sent letters and telegrams of regret. The chairman proposed the "Houses of Parliament." Sir J. F. L. Rolleston, M.P., who responded, mentioned the fact that he was the only surveyor with a seat in the House of Commons. Sir Alexander Binnie (chief engineer of the London County Council), in giving the toast of the evening, "The Surveyors' Institution," observed that his profession was intimately connected with their own. He looked upon their institution with a great deal of pride and pleasure. It was a young institution, and it was rapidly growing, because its members had appreciated what was absolutely necessary for the growth of any profession in this country. They had established themselves in the first place, and then they were determined by their action that their profession should be kept up to the highest mark possible in an advancing age like the present. By the examinations which they had instituted they would establish, he felt confident, a profession of which all might feel proud. In reply, the President said he did not think the public generally were quite aware of the position occupied by the institution at the present time. Those who remembered the old days of the surveyors' profession could compare the present time most favourably with that period. When the institution was started many years ago—he believed that the first report was published in 1869—they had about 200 members. The last report showed that they had between 3,000 and 4,000 members, and he was happy to say that the numbers were still increasing. Mr. Rogers, their excellent secretary, had something like 400 awaiting examination at the present time, and if half those passed this year it would increase the number two or three hundred more. The accounts of the institution were also most satisfactory, and after paying off the debt in connection with the new building in Great George Street, which involved an outlay of £31,167, they had a considerable balance in hand. Their Forestry Museum had been re-arranged, while the library now contained something like 8,000 volumes, comprising works upon every subject of interest and use in the profession. The benevolent fund was established not quite two years ago by their esteemed past president, Mr. Robert Vigers. It had been very successful, and they were now in a position to commence operations. A sum of about £7,100 had been obtained in less than two years, and was invested. The council felt that the fund ought to be greatly augmented, and he appealed for further financial help. Finally, he complimented Mr. Penfold and Mr. Rogers on the good work they had done for the institution, and referred with regret to the death a few days ago of their clerk, Mr. Bennett, one of the most painstaking and conscientious men he had ever met.

Mr. Thomas H. Mawson, the well-known garden architect, has secured suitable office accommodation at 28 Conduit Street, Regent Street, W., for the convenience of clients who, whilst in town, wish to consult him. Work for clients in Ireland, North Wales, the northern counties of England, and Scotland will, as before, be conducted from the Windermere office. The London office hours are from 10 to 5, Saturdays, 10 to 1.

Correspondence.

Load on Girders.

To the Editor of THE BUILDERS' JOURNAL.

HARROGATE.

SIR,—I am much obliged for Professor Adams' reply to my letter on page 50 of your issue for February 20th, but am not quite clear about his theory. What is wanted is a girder to carry the weight over the clear span. There is certainly a load on the wallholds (if the girder is built in), but this is supported by the piers and rather increases the resistance of the girder to carry the load over the span. I understand by Professor Adams' theory that the girder requires to be made stronger as the wallhold is increased. If the girder in question had a wallhold of 4ft. it would be larger than if it had only 2ft. wallhold, all other conditions being the same; or if the girder rested on the walls (being fitted into recesses) with no weight on the wallholds it would be of smaller size than if the ends were securely fixed. With all due deference, I think this is wrong. As regards the natural corbel theory, I doubt whether the walls would stand if corbelled out as shown in the clear part of the sketch, and it would be better to err on the side of safety, as Professor Adams now suggests, but I am not yet clear as to the length of girder being the basis for calculating the load to be carried over the span. The piers should, of course, be able to sustain both this load and the weight of walls, floors and roof, not included in the load on the girder.—Yours truly, J. D.

To the Editor of THE BUILDERS' JOURNAL.

SIR.—In reply to the above letter, it is usual among engineers to take the effective span of a girder as the distance from centre to centre of the bearing surfaces. The actual span when fixed may be anywhere between the full length of the girder if it has considerable camber, and the clear span if the girder has no original camber and deflects with the load. One advantage of camber is that it throws the pressure well back from the face of the wall, but it practically increases the span. As to the corbel action of the walls in the second case, it is not supposed that the walls would stand if the whole shaded portion were removed, but the upper part remaining in place acts as a strut between the unshaded top ends. If a girder were built into a wall at its ends, further than sufficient to get the required bearing surface, it would of course alter the conditions and be an unfair straining of the question. The method already illustrated is not intended to be more than an approximate means of arriving at the weight to be carried, and if there is any doubt as to where to measure the load it is better to take advantage of the doubt on the side of safety and measure over all.—Yours truly, HENRY ADAMS.

The Art of Planning.

To the Editor of THE BUILDERS' JOURNAL.

BIRMINGHAM.

SIR,—The publication of several plans in recent issues of your journal causes me to make a few remarks on the subject of planning. This seems to be in a very parlous state, and if something is not soon done it bids fair to become a lost art. The whole aim of the present school of architects would seem to be "elevation"—and that alone. When one sees houses planned with doors so close to a fireplace that no one can sit near the fire; doors so placed that there is no space for a bed in the room without it is in a draught; it is time to protest. Surely it is not necessary to have bath-rooms and W.C.'s over the front doors so that soil and waste pipes with their discharges greet the coming guest. This is the present form of "welcome" in many houses. Kitchens which are only passages, with the light on the wrong side of the range, may also be cited. Do urge pupils to plan—plan and then plan.—Yours truly,

T. W. F. NEWTON.

Engineering Notes.

An Underground Railway at Berlin is to be constructed.

A Scheme of Underground Trams for London is under consideration.

Messrs. Coulson and Co., engineers, of Bishop Auckland, are extending their works and erecting new shops.

The Ellerbeck Hospital, Workington, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Runcorn and Widnes Transporter Bridge.—The Local Government Board have sanctioned the borrowing for thirty years of £10,000 for investment in the Runcorn and Widnes Transporter Bridge Company.

Regent Bridge Works, Aberdeen.—At Aberdeen harbour a new bridge is being erected to replace the existing Regent Bridge, which has become totally inadequate for the traffic. It is of the swing type with unequal arms; the long arm spans the new entrance 67ft. wide, while the short arm, loaded with kentledge, forms the counterbalance. The bridge has a total length of 155ft., with a width of 45ft., and has been designed to carry the heaviest railway, vehicular or traction-engine traffic; it will be constructed entirely of mild steel. The total estimated cost of the improvement works exceeds £100,000.

Maximum Charge for Electric Light.—The question whether the maximum charge for electric light, to be inserted in provisional orders before Parliament this Session, should be reduced to 6d. per unit was the subject of a conference held last week at the Board of Trade. Sir Courtney Boyle, having heard the arguments for and against the proposal, said the Board of Trade were very strongly of opinion that 8d. per unit—the present maximum—was too high. He thought a 7d. maximum would be adopted in a normal case. In very large populous places a 6d. maximum would be tried.

Crompton and Company, Limited.—With a share capital of £300,000 (made up of 100,000 shares of £3 each) this company now issues 46,000 shares of £3 each at the price of £3 5s. per share, which will rank in full for dividend as from April 1st next. The business was founded in 1878, and acquired by the company on its incorporation in 1888. It is one of the leading electrical firms dealing with lighting and traction. The subscription list was opened yesterday and will be closed to-morrow (Thursday). Applications should be sent to Messrs. Barclay and Company, Limited, 54 Lombard Street, E.C., or to any of their branches.

Voltage in Electric Lighting.—A Board of Trade enquiry was held last week at the Westminster Town Hall into the application of electric lighting companies and local authorities supplying electricity to have power to increase the pressure from 100 volts to a higher pressure, with the consent of the consumer, but failing that, as might be settled by the Board of Trade. At present no alteration can be made without the consent of the consumer, and it is to consider the abrogation of this provision that the enquiry was held. Mr. Balfour Browne, K.C., for the Westminster Company said that the proposed change would effect a saving to the company of £112,000 in twenty-one years, and this would enable them to supply consumers more cheaply.

"Tube" to the Isle of Wight.—It is proposed to construct a "tube" under the Solent. A Bill has been deposited for hearing at the present session. The total length of the proposed line is about six miles, of which the first four miles are on the mainland. The tunnel will start near Hurst Castle and run to a point near Totland Bay, where it will join the Freshwater and Yarmouth line. At this particular point the Solent is only 1½ miles broad, and it it is stated that no difficulties of engineering stand in the way of the work. The tunnel would be sufficiently large to take the ordinary rolling-stock of the London and South Western Railway, and no doubt through trains to Newport would be run from Waterloo. The journey by the present route takes about 4 hours to accomplish, and it has been calculated that by the tunnel route one could get from Waterloo to Newport in 2¾ hours.

Builders' Notes.

Mr. Mark Woolgar, master builder, of Southwick, died recently.

Messrs. Colledge and Bridgen, Midland Lock Works, Wolverhampton, have placed on the market a "New Century" patent casement stay, of which we give an illustration below. It has been well received and is a neat, durable and cheap fitting. Its price (in bronzed steel) varies from 3s. 9d. per dozen for 8in. stays to 6s. 8d. for 18in. stays: in brass the prices are respectively 15s. and £1 10s. 10d.: while another quality in extra strong brass costs 18s. 4d. and £1 15s. respectively.

"NEW CENTURY" PATENT CASEMENT STAY.

William Oliver, Sons and Howard, Limited.—The prospectus of this new company, which has been formed to acquire the business of Messrs. William Oliver and Sons, of 120 Bunhill Row, E.C., timber merchants, and the hardwood portion of the business of Messrs. W. W. Howard Brothers and Co., of 109 Fenchurch Street, E.C., states that the share capital will be £290,000, made up of 100,000 5½ per cent. cumulative preference shares of £1 each and 190,000 ordinary shares also of £1 each. There will also be issued £150,000 of 4½ per cent. first mortgage debenture stock (part of an authorised issue of £175,000—all ranking *pari passu*). The list was opened yesterday and will be closed today at 4 p.m., for town and country. Sir Richard Farrant is among the directors.

In the Fire Prevention Section of the Building Trades Exhibition space has already been allotted to the following firms:—Asbestos and Asbestic Co., Ltd.; D. Anderson and Sons; British Luxfer Prism Syndicate, Ltd.; Mr. Bugge; British Uralite Co., Ltd.; Broadbent and Co., Ltd.; Clark, Bunnett and Co., Ltd.; Crittall Manufacturing Company; Conduit and Insulation Co., Ltd.; Columbian Fireproofing Company; Green and Co.; Hobbs, Hart and Co.; Mr. F. Jones; Mural and Decorations Syndicate, Ltd.; New Expanded Metal Company; Non-Flammable Wood Company; Pilkington Bros.; Potter and Co., Ltd.; G. A. Williams and Sons. Firms that had not yet definitely applied should make application before the 15th inst. to the offices of the British Fire Prevention Committee, 1 Waterloo Place, Pall Mall.

The Bristol Clerks of Works' and Builders' Foremen's Association held its annual dinner recently. The chair was taken by Mr. Frank W. Wills (President of the Bristol Society of Architects), and he was supported by Councillor Lee, Mr. W. J. Steele (deputy City Engineer), Mr. H. Dare Bryan (Hon. Sec. Bristol Society of Architects), Mr. A. Krauss (President of the National Association of Master Builders of Great Britain), Mr. G. Humphreys (President of the Bristol Association of Master Builders), Mr. F. N. Cowlin, Mr. T. Lovell, Mr. Geo. Wilkins, Mr. A. J. Beaven, Mr. E. J. Neale, and Mr. A. Dowling, members of the Bristol Association of Master Builders. The management of the Clerks of Works' and Builders' Foremen's Association was represented by Mr. W. A. Woodland and Mr. W. F. Read (respectively President and Vice-President), and Mr. R. Hillier (Secretary). Mr. F. N. Cowlin submitted the toast of "The Architects," and Mr. H. Dare Bryan responded. Mr. W. Hollyman then proposed "The Master Builders." Mr. Krauss, in responding, urged the adoption of a scheme of their own for accidents, sick, and annuity provision, as well as life policies. In the north the assistance kindly and willingly rendered by the master builders, plus the contributions of the members, had already put this on a sound and satisfactory footing. The members could not serve two masters, the men's trade-union and the builders', and he remarked that they would be benefited by forming their association into a benefit society so that those members who now belong to the trades-union might be free from the men's union, and at the same time lose none of the benefits. Mr. G. Humphreys also responded. The chairman proposed "The Bristol Association of Clerks of Works' and Builders' Foremen," and congratulated his hearers on the progress the association had made. His opinion was that such associations did great good to the building trade. Architects and builders found the value of such an association in their midst where they could apply for men they required, and when he wanted a clerk of works he could rely upon the secretary sending him a suitable man. Mr. W. A. Woodland first responded, and said that association had existed for eight years. During the first few years progress was somewhat slow, as they were met with a certain amount of opposition, but lately they had made much more progress, and he thought they were in a fair way of successfully achieving the aims of the pioneers of the association. These aims all tended to one and the same goal, and that was the raising of the social status of clerks of works' and builders' foremen. Mr. W. F. Read also responded.

Law Cases.

A Dispute about Laths.—In the King's Bench Division of the High Court of Justice the case of *Vigers Brothers* v. *Sanderson Brothers* was recently heard. In delivering judgment Mr. Justice Bigham said that the action was brought to recover £1,307, the price of a quantity of sawn laths sold by the plaintiffs to the defendants, or, in the alternative, damages for non-acceptance of the same. Two contracts, dated respectively November 23rd, 1899, and December 16th, 1899, were made, the former specifying for laths of lengths varying from 2½ft. to 4½ft., and the latter for laths of lengths varying from 2ft. to 4½ft., but not more than 3 per cent. of 2ft. Under these contracts, and in pretended fulfilment of them, two parcels of laths were shipped by or on behalf of plaintiffs in the "Ella," a ship provided by the defendants. The shipment under the earlier contract contained 33 per cent. of laths 5ft. long (a length not mentioned in the specification); and the shipment under the later contract contained about 60 per cent. of laths 2ft. long, instead of not more than 3 per cent. The defendants rejected the goods and refused to accept the drafts. The question was whether the rejection was justifiable. On the one hand the plaintiffs said that the defendants were bound to take the goods subject to an allowance for any loss due to the failure to comply with the specifications. On the other hand the defendants said that the goods were not what they bought, and, therefore, that they were not bound to accept them. Evidence was given as to the value of laths 2ft. long, and as to the value of laths 5ft. long, and the judge found as a fact that neither length was worth the contract price; the former was practically worthless and the latter was very difficult to sell in large quantities, and required more labour in handling than the shorter lengths. In his opinion neither shipment could be regarded as in any sense a compliance with the contract, and he therefore gave judgment for the defendants.

Apprentices and Their Indentures.—At Plymouth recently Percy Sleeman and Ernest Palmer, apprentices, were summoned by Edwin J. Manning, builder, to fulfil the terms of their indentures. Complainant stated that defendants were apprenticed to him to learn the trade of a plasterer. Lately they had been very irregular in their attendance at work, and were frequently caught playing in working hours. On January 21st they refused to work because there was no labourer to attend them, and they had not returned to duty since. Cross-examined, complainant said mixing mortar was part of the trade of a plasterer. Apprentices sometimes had a labourer to attend them, but it was also customary for them at times to attend on themselves. Defendants alleged that for the last four months complainant, instead of teaching them plastering, had employed them on labourers' work. No plasterer worked with them to teach them. They had to work with other apprentices with no one to superintend or teach them. Edwin Williams, plasterer, testified that it was contrary to custom in the trade for plasterers or plasterers' apprentices to mix mortar or attend on themselves. It was the custom for the apprentice to work with a plasterer, and so learn the trade. The question at issue was whether the master had the right to habitually compel the apprentices to do labourers' work. The Bench were not satisfied that the complainant had ordered his apprentices to habitually do labourers' work, and made an order upon defendants to perform their duty under their indentures.

Delay in Submitting Plans for New Buildings.—At the North London Court last Wednesday Messrs. W. J. Bush and Co., Ltd., were summoned for failing to comply with a notice to set back the external fence of a new building which they have erected in Sheep Lane, Hackney, to a distance of 20ft. from the centre of the roadway. Mr. Childers, who conducted the case for the London County Council, explained that the London Building Act of 1894 and the Amending Act of 1898 required that where new buildings were erected on the site of old buildings a plan of the old buildings should be certified by the district surveyor before the new buildings were begun. Unless such plan were certified the buildings were to be treated as entirely new and no part of them or the external fence could be erected within 20ft. of the centre of the roadway. In the present instance the defendants were the owners of property on the east side of Sheep Lane, which was a very narrow thoroughfare. A number of old cottages on this land were pulled down, and on July 13th last the builder gave notice of the erection of a new factory and stables. On July 25th the surveyor to the Hackney Vestry called the attention of the London County Council to the fact that the buildings were in course of erection. On August 25th Mr. Hamilton, the defendants' architect, submitted to the district surveyor a plan of the old buildings and the district surveyor certified the line of the old fence. The case for the Council was that this plan was too late, and being late the building came within section 13, sub-section 1, of the Building Act. Section 200, sub-section 2, fixed the penalty at not less than 40s. or more than £5. Mr. Macmorran, K.C., said that it was a purely technical offence; the plan was late and the defendants admitted it, but the point for the magistrate to consider was whether it was absolutely necessary for the certified plan to be sent in before the building was begun. Mr. Fordham said that he should find that the plan which had been certified by the district surveyor was sufficient to comply with the Act, but it was not submitted in time. He should hold that the Act contemplated the production of the plan before any new building was begun. He must therefore convict. He fined the defendants £3 3s. with £2 2s. costs, but he would, if asked to do so, state a case for the opinion of the superior Court.

Disregarding the Building By-Laws.—In the Chancery Division on February 28th Mr. Justice Cozens-Hardy resumed the hearing of the action brought by the Corporation of Harrogate against Mr. William Holmes, to obtain an injunction restraining the defendant from erecting or permitting to remain erected buildings in Valley Drive and Valley Mount, Harrogate, contrary to the Corporation Act of 1893 and the by-laws. Mr. Frank Bagshaw, the borough surveyor, having given evidence, Mr. Eve, the defendant's counsel, admitted that the defendant had not obtained the approval of the Corporation to the plans, and that the height of the buildings was in excess of the height permitted, but he contended that the ventilation was thorough, and that the defendant had complied with the spirit of the by-law. Mr. Justice Cozens-Hardy said he did not suppose that the Harrogate Corporation desired to do anything but their duty, but the defendant was "in mercy," and he must make some terms with them. Council thereupon consulted their clients, and Mr. Micklem subsequently informed his lordship that the parties had agreed to an order. The defendant was prepared to remove the upper part of his building, to strengthen all the walls as might be required by the Corporation, and to submit forthwith plans to be approved; and Mr. Eve stated that on defendant giving that undertaking there would be no order in the action except that defendant should pay the costs. Mr. Justice Cozens-Hardy approved the arrangement, observing that it was important builders should understand that they could not go on without approval of the plans.

Giving of Receipts by Public Bodies.—At the Town Hall, Chertsey, James Kingston, of Addlestone, was recently summoned by the Chertsey Urban Council for £220 1s. 7d. in respect of work performed under the Private Streets Works Act, 1892. Mr. T. E. H. Chaldecott (clerk to the Council) said that certain work had been done at Common Lane, near Woodham, by the Council after the usual notices had been served. The charge was 6s. 4d. per foot frontage in respect of a certain house and garden situated in that lane, and for 405ft. of land in the same road. Interest at the rate of 4 per cent. was also charged from the date when the work was executed. Mr. Kingston had given the Council a small strip of frontage in the lane, and an allowance was to be made for it in the final apportionment. That had somewhat complicated the figures, owing to which the surveyor made a mistake, and instead of charging him £255 4s. 8d. for the house and garden frontage, he only charged him £170 4s. 8d., thus leaving £85 balance due to the Council. Mr. Kingston saw that, and said "You have given me a receipt, but you have not made it in full. Will you please do so?" Unfortunately the surveyor acceded to the request, and therefore the Council claimed that, as he had made an error, the remainder of the money was the Council's in spite of the receipt which had been given. Then in regard to the meadow land, for which Mr. Kingston was charged £128, he said that it was not his, and that he had sold it to a Mr. Gwyer. But he (Mr. Chaldecott) contended that, no matter what contract had been entered into by Mr. Kingston in regard to the disposal of the land, he was still the owner at the time, and if he had an equal claim against Mr. Gwyer he would have to settle it in another Court. As to the difficulty about the receipt the Bench should remember that it was not a case of a man giving a receipt for money due to himself, but of an official giving one for a public body. He therefore submitted that a genuine error of that description should not bar that public body from recovering what was due to them. The magistrates retired to consider their verdict, and on returning into court the chairman said they thought the Council had failed on both issues, namely, the £85 and £128.

Quantities: A Curious Libel Action.—In the case of *Sadgrove* v. *Hole*, heard last Friday in the Court of Appeal, the defendant asked for judgment or a new trial in an action for libel tried before Mr. Justice Ridley and a common jury, when judgment was entered for the plaintiff with £5 damages. The costs had since been taxed and were returned at £140. Mr. Firminger, in support of the application, said the defendant desired to throw two shops into one, and he employed an architect named Webb. The contract was submitted to several builders, and it came to his knowledge that the quantities submitted to two of them were in excess of the amount which he thought was permissible to be paid. He therefore, solely to save the builders wasting their time, sent a hurried postcard to each saying the quantities submitted were incorrect, and asking them to come round to him and see the plans before making their tenders. The Master of the Rolls, in giving judgment, said the alleged libel was contained on a postcard from a building owner to a builder, and the point raised was unique. So far as material the libel was this: "Quantities sent to you this morning by architect are entirely wrong." The question was whether that constituted a libel on the clerk of the architect, who was not named, but who came forward as the plaintiff in this action and said that this statement was a libel on him as being the "quantities clerk" of the architect referred to in the document and answerable for the correctness of the estimates. He could not say that the words were incapable of being a libel, but in his opinion they were written on a privileged occasion. The circumstances being privileged there remained but the one question, Was the privilege destroyed by evidence of express malice? In his opinion there was none. For these reasons the court ought not to put the parties to the expense of a new trial. Judgment would be entered for the defendant, with costs here and below. The other Lords Justices concurred.

Workmen's Compensation: Height of Buildings.—A somewhat unusual case was heard recently at the City of London Court. Under the Workmen's Compensation Act, *William Joseph Lawrence* sued *Mr. J. Spencer* for damages for personal injuries. The plaintiff was employed in pulling down some large premises at the corner of Paternoster Row and Newgate Street. While knocking down a wall, he fell to the ground and was badly injured. His wages had been 26s. a week, and he now claimed half that sum under the Act. The only question in dispute was the height of the building at the time that the accident occurred. The defendant's case was that as the building was not 30ft. high when the plaintiff fell it was impossible for him to recover anything in the proceedings. The plaintiff, on the other hand, said that the building was 60ft. high at the outset and that it was over 30ft. high when he was engaged upon it. It was shown that the building was over 30ft. high when the plaintiff was working upon it, and the learned Commissioner found that the plaintiff was entitled to recover the amount claimed of 13s. per week, and the costs of the proceedings.

Surveying and Sanitary Notes.

Drainage Construction.—At a meeting of the Society of Engineers last week a paper entitled "Notes on certain details of Drainage Construction," was read by Mr. Gerard J. G. Jensen. The author, at the outset, pointed out the desirability of giving attention to the merest details in drainage construction. Amongst certain matters which up to the present have been misunderstood or neglected, none, he thought, claimed greater attention than the construction and arrangement of ventilation pipes. The practice of constructing ventilation pipes of iron was reprehensible, as they were invariably found to rust in the interior, thereby not only deteriorating and making renewal necessary, but also becoming blocked and thereby rendering insanitary that which might otherwise be a good system of drainage. Amongst other details of construction pertaining to ventilation pipes, knowledge regarding the action of drain air upon the human constitution was still inexact. Pending a more complete knowledge on the subject he urged the necessity of erring upon the safe side in choosing positions for liberating drain air through ventilation pipes. With regard to the still frequent practice of providing waste-pipes with hopper heads at the points at which branches from fittings within the house join the main pipe, he could imagine no more insanitary and offence-giving construction, and thought that the fullest measure of the evils of the system was perhaps experienced under the, at present, fashionable flat life. Some observations on manholes and drain joints followed, the paper concluding with some remarks on overflow-pipes from lavatory basins, baths and sinks. The author considered that too little attention is, as a rule, bestowed upon these details, and suggests that the musty smells in bath rooms and similar apartments might frequently be ascribed to faulty overflows. The continued manufacture and use of uncleanly overflow-pipes, he thought, must be one of the wonders of house drainage, since their evils must be patent to all.

ARCHITECTURAL ASSOCIATION.

DAY COURSES OF INSTRUCTION.

A SPECIAL General Meeting of the Architectural Association was held last Friday evening to consider the Committee's scheme for the establishment of day courses of instruction in connection with the Association. Mr. W. Howard Seth-Smith, the president, was in the chair.

Early in the present session a strong Education Committee was appointed to consider and report upon the whole subject. This committee consisted of Messrs. Cole A. Adams, F. T. Baggalay, R. S. Balfour, G. B. Carvill, Arthur Cates, B. F. Fletcher, H. L. Florence, F. T. W. Goldsmith, H. T. Hare, F. G. F. Hooper, P. J. Marvin, E. W. Mountford, Beresford Pite, W. A. Pite, H. W. Pratt, G. H. Fellowes Prynne, E. Howley Sim, H. D. Searles-Wood, W. Howard Seth-Smith, John Slater, Leonard Stokes and Aston Webb, A.R.A. After six meetings their report was presented. The General Committee practically adopted the whole report with few amendments. The proposals are as follows:—

1. That the studio be opened during the day, and that day classes be established forthwith. The work in these classes and in the studio to be of a preparatory and supplementary nature suitable for those who have entered or are about to enter architects' offices as pupils.

2. That this branch of the work of the Architectural Association be known as the day school, while the present classes be called the evening school.

3. That the first course of studies be arranged to cover one year, but students to be afforded the opportunity of taking a second year in the studio, when they might also attend some of the evening classes.

4. That each year be divided into three terms, namely: autumn, spring, and summer, consisting as nearly as may be of 13 weeks each.

5. That the work in the studio be supplemented by a certain number of lectures on History and Construction, so that the students may better understand their work.

6. That a master of the studio be appointed at a salary to be fixed by the committee, who shall deliver lectures on the History of Architecture and Elementary Building Construction. The master to nominate an assistant to help him in the studio, such assistant, if approved, to be remunerated as may be deemed expedient by the committee.

7. That the studio be open from 9 30 A.M. to 5 P.M. (1 P.M. on Saturdays), and that the assistant master be in attendance during these hours. The master himself, however, would attend at stated times to instruct the students and deliver his lectures.

8. That the fee for the full course be 12 guineas per term or 35 guineas per annum, but students taking only the lectures to pay a fee of 2 guineas per term for each course, or 5 guineas per annum. Students wishing to join the day school must submit a letter of recommendation.

9. That after payment of the fees for the first year's course students shall be eligible for election as ordinary members of the association without paying the usual entrance fee.

10. That students should be encouraged to cultivate a thorough knowledge of the French and German languages (if they have not already acquired same), as these languages are particularly useful for purposes of study and when travelling abroad.

11. That the studio library be augmented as may be found necessary, and be available at all times when the schools are open.

12. That the management of the school be under the direction of the committee of the Architectural Association, assisted by an advisory board of eminent architects and other gentlemen.

13. That the following subjects be included in the curriculum:—*First Year's Course:* (*a*) The use of instruments and scales, (*b*) freehand drawing, (*c*) the five orders of Classic architecture, (*d*) the elements of the various styles of architecture, (*e*) the principles of mechanics, (*f*) elementary construction, (*g*) sketching and measuring details and portions of existing buildings, (*h*) thirty-six lectures on the history of architecture (illustrated by visits to buildings and museums), (*i*) thirty-six lectures on elementary construction and materials (illustrated by visits to workshops and buildings in progress). Each student will be expected to take up a course of reading under the direction of the studio master. *Second Year's Course:* (*a*) Continuation when necessary of the subjects forming the first year's course, (*b*) perspective and sciography, (*c*) descriptive and applied geometry and graphic statics, (*d*) principles of architectural design. Each student will be expected to take up a course of reading under the direction of the studio master.

N.B.—Students taking a second year in the studio should attend such lectures or classes, day or evening, as the master may advise. The master of the studio will direct students as to their vacation studies.

Mr. ASTON WEBB, A.R.A., in proposing the adoption of the scheme, said: A young man coming into the profession at present could either become an articled pupil or enter an office in some capacity and work into a position. A pupil when he entered an office was set to work, probably at drawing the orders and studying the elementary problems of construction, and made up these pursuits with a certain amount of practical office work and tracing. The idea suggested itself to the committee that this drawing and tracing, the elementary problems of construction, stresses and strains, and materials could be better taught in a school than in an office. If pupils went there for a year they would go into an office better qualified to learn than if they went there altogether ignorant. He himself had had one uncertainty about the scheme: that a young man who had gone through the course for one or two years might think he was a perfectly fledged architect and go into an office as a head assistant. If that were likely to occur it would be a great misfortune. He had written to Professor Simpson, the professor of architecture at the Liverpool University, upon this question, and he had replied that in his opinion there was not the slightest danger to be apprehended. Professor Simpson held that the system was better than that of France or Germany, as it let pupils into an office afterwards. As to whether the Architectural Association was the best body to carry on the classes, he thought most of them would rather like to see the training of architects to some extent in the control of architects themselves, who must know better the requirements of students than instructors who were not architects at all. With regard to the risk that the Association ran, the Committee had had the business foresight to see that the members were free from any loss which might occur; the promises which had been made would absolutely free the Association. If principals would advise parents to send their sons to be grounded at the Association before going into offices, the classes would be a success. If these classes turned out a financial success it would enable the Association to expand itself very considerably and aid them to secure more accommodation.

Mr. JOHN SLATER seconded the motion, and Messrs. Leonard Stokes, A. S. Taylor, Arthur Stratton, Arnold Mitchell, F. G. F. Hooper and H. P. G. Maule also spoke in favour of the scheme.

Mr. W. H. SETH-SMITH in putting the motion read a letter from Mr. Beresford Pite, who was unable to be present, objecting to the inclusion of his name in the proposals of the committee as if agreeing with their recommendations. Mr. Pite stated he was clearly of the opinion that the proposal was unwise in the true interests of the Association and entirely dissociated himself from the recommendation. In regard to the scheme for new premises Mr. Seth-Smith said they had almost £1,500 promised and were only waiting to find a convenient site to bring the scheme to fruition.

The scheme for day classes was then adopted unanimously. The following alterations of the bye-laws were then agreed to:—

Add to bye-law No. 14: "*Each student who has paid the fee for a Course of Day Classes of Instruction for one year shall be eligible for election as an Ordinary Member without payment of an entrance fee.*"

Add to by-law No. 15, after the words "each Ordinary Member": "(*with the exception stated in by-law No.* 14)."

Add to by-law No. 27 at end: "*or one of the Hon. Secretaries.*"

Add to by-law No. 30 before the word "Auditors" "*Honorary.*" (This was made necessary by the decision to employ a regular auditor for the accounts.)

Add to by-law No. 36 the word "*Honorary*" before "Auditors" in every case.

By-law No. 43 to read as follows:

"*A Special General Meeting shall be called by the Honorary Secretaries when required by the Committee, or at any time, not less than two weeks nor more than eight weeks after the receipt of a requisition, stating the purpose for which the meeting is required, and signed by at least twelve Ordinary Members. The presence of twenty-five Ordinary Members shall be necessary to constitute a quorum at any meeting called under this by-law, and in each case the agenda of business to be considered shall be duly posted up in the premises of the Association, advertised, sent by post or otherwise, as may be determined by the Committee, at least one clear week prior to the meeting and specifying the place, day and hour, and no other business shall be taken at such meeting.*"

Omit by-law No. 44. (The two by-laws Nos. 43 and 44 originally clashed).

Add the following new by-law: "*No member of the Committee shall be appointed to a paid office or lectureship in connection with the Architectural Association.*"

New Patents.

These patents are open to opposition until April 13th.

1900. — **White Lead.**—2,774, G. BISCHOF, Hythe Road, Willesden Junction, London, N.W. This invention relates to a process for converting white lead into a marketable oil paste or "ground" white lead without previous drying, which is an operation dangerous to the health of the operatives. The process consists of the following stages:—Filter pressing and washing, pugging about a third of the white lead with about two-thirds of the oil, running off separated water, pugging in the remainder of the white lead and oil, and drying by a current of hot air while the material is being pugged.

Imitation Stained Glass.—7,491, J. LEROY, 11 Rue Chateau Landon, Paris. A design is printed on paper which is afterwards varnished. Usually it only then remains to apply a coat of varnish to the reverse side of the paper, but according to this invention the varnish (whilst wet) is covered with finely powdered glass. By this means it is claimed that a complete imitation of the real article is obtainable.

Gas-heating Stoves.—10,255, T. F. EDGEWORTH, 127 Cheltenham Road, Bristol. In order to gain a maximum of heat a Bunsen flame is enclosed in a tube of metal or fireproof material of such diameter and length that its inner wall is in contact with or close to the flame. The tube is fitted with a baffle-plate at the top.

Brick Kilns.—16,422, W. SAYER, The Mount, Rowditch, Derbyshire. Bricks not thoroughly dry are set in that part of the kiln which is just commencing to heat, so that the waste gases from the burning bricks, passing on their way to the damper chamber or drying tunnel, will part with some heat and take up moisture. Thus the atmosphere of the drying chamber can be regulated by the vapour given off by the bricks last set in the kiln.

Burglar Alarms for Windows and Doors.—20,795, J. G. MOSER, 2,711 Armand Street, St. Louis, Missouri, U.S.A. According to this invention, should the door or window be opened by a house-breaker, a trigger is operated and fires a cartridge!

Spring Roller Blinds.—21,192, T. W. TIDMARSH and F. C. TIDMARSH, both of 226 Upper Street Islington, London, N. This invention applies the band brake to blinds. Springs are arranged to act on the brass end cap, being operated by a cord.

The following specifications were published on Saturday last, and are open to opposition until April 20th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1899.—22,731, LEIGH (*Mollenhauer and Mayer*), locks and latches.

1900.—2,644, ADAMS, controlled flap-valve or sluice. 2,739, GREEN construction of fireproof floors and roofs. 2,759, YOULTEN, stoves for heating purposes. 3,094, SPENCER, kilns for burning limestone. 4,460, SKINNER, fire and burglar alarm. 5,670, TAILBY, circular saw benches. 6,142, BURGESS AND BURGESS, saw-guards. 6,242 and 6,324, ETCHELLS, locking and releasing gear for hoist gates or doors. 7,024, GASKELL, chimney cowls. 7,119, SYMINGTON, chimney tops. 7,356, SCHATTNER AND HARMER, electrical incandescent lamps. 7,459, MOORE, water-closets. 11,547, HILL, fittings for overhead trolley systems of electric tramways. 17,233, BRIERLEY, adjustable scaffolding bracket. 18,316, MILLER, instrument for trisecting any angle. 19,964, RIXSON, door check and spring. 20,035, ROSIER, hydrocarbon burners for heating and lighting. 20,288, GRAPENGETER, steam pile-drivers. 20,355, CURLEY, scaffolds. 22,375, O'BRIEN (*Galiazzo and Cristilli*), portable scaffolding ladders. 23,040, KRAUSE AND BEDDIES, process for the impregnation of wood and fibrous substances. 23,045, JACQUOT, JACQUOT AND TAVERDON, portable planing apparatus. 23,682, BROWN, prism plates for windows. 23,837, BÜHL, saw-setting machines.

1901.—665, VIVINUS, universal joints. 927, AXER, barrels for transporting cement. 1,058, SHELDRAKE, incandescent gas burners.

THE HOUSING PROBLEM.

L.C.C. CRITICISED.

AT the annual meeting of the Artizans', Labourers' and General Dwellings Company, Ltd., held last Wednesday at Westminster, Mr. Ernest Noel (the chairman) said that the gross revenue for the past year amounted to £181,000, and the nett revenue to £115,000, which enabled the Board to pay the usual 5 per cent. dividend. The housing question had now become most prominent, and a great many promises were continually being made which, he believed, it was utterly impossible to fulfil. The London County Council had pledged themselves to a great building scheme at Tottenham, and he thought that they had chosen a good situation for their experiment. It was well supplied with workmen's trains and the price given for the land did not seem excessive; but would the Council's object be attained? He understood that that body hoped to provide homes so cheaply that men with wages of from £1 to 30s. per week would be able to take them. He could only most heartily wish the Council success; but he felt certain that the Council could not build so as to enable them to fix the rents as low as the ordinary builders of cottage property were daily providing. He could not but think that the Council's building schemes would have an injurious effect on the more efficient housing of the poorer members of the community. Did the Council intend to build for the whole working population of London which was still indifferently housed? If not, their action must be mischievous. At the present time large numbers of persons were engaged in building such houses; and if the rates were to be used to make up the loss sustained by the Council in letting houses below their value, or below what would return the interest on the borrowed money, so as to give cheap homes, two things would arise. First, the whole of the working men living in ordinary houses would be taxed to give a small and favoured number cheap houses; and secondly, those now building would withdraw from a competition which would be manifestly unfair, and then fewer houses would be built. After all, it was these small builders who had done most to provide houses for the working classes. Their own company was the largest of the associations engaged in the work of providing pleasant and sanitary homes for the people; and yet in their 5,700 separate houses and 1,467 separate tenements in block buildings they provided for rather less than 50,000 people, so that the combined efforts of all the associations engaged in building workmen's houses did not compare with the number of houses provided by the comparatively small private builders. These the County Council would seriously hinder; and he ventured to assert, without fear of contradiction, that anything which checked or put hindrances in the way of those who were by free trade supplying this great want would render the housing question far more difficult of solution. Sir Richard Farrant (deputy chairman) expressed the opinion that although the jerry-builder, his methods and materials, needed to be supervised, he was, after all, the man who made the main provision for the working classes of London. Although it had been the fashion to deride him, he should like to say that, under proper control and with proper regulations, the jerry-builder was absolutely necessary to provide cheap dwellings for the working classes. This company found, at Streatham especially, that their high-class buildings were not appreciated. The tenant did not care anything about the solidity of his building and was not willing to pay 1s. a year more to have his house built with better bricks or better tiles. The poor man wanted the biggest rooms he could get at the lowest rent. He was not satisfied that, however energetic the County Council might be, and however cheaply they might get their money, they would be able to compete as regarded price with the ordinary conditions of building as carried out by the small builder working with his own capital. The Government had recognised to some extent their responsibility, and had sold to the County Council nine acres of land at Millbank for £2,500 an acre, whereas for commercial purposes it was worth at least £10,000 an acre. In evidence given by him some years ago before a committee of the House of Commons on the housing of the poor he laid it down that it was the duty of the great landowner to provide on his estate for all classes of the community. The late Duke of Westminster recognised that duty, and all over his estate he provided this and similar companies with sites for block buildings at a sixth, and in some cases a twelfth, of their market value. The late Marquis of Northampton did the same on his Clerkenwell estate. The agent of the present marquis now offered at 6d. per foot what was formerly offered at 2d., and the result was that land taken at the higher figure necessitated the rent being 1s. per room per week more than if obtained at the lower price. Lord Portman had also provided this company with land at 2d. per foot. The great landowners were not, however, offering any more land for the erection of workmen's dwellings, and he was afraid that this was due to the County Council assuming the responsibility which others ought to bear.

Masters and Men.

A Strike of Painters at Chester has occurred in regard to the allowance for lodging money to men working away from town. The men demand 4s. a week country allowance, the foreman to be allowed 6s. per week; in cases where a man is sent into the country for a portion of the week they shall be entitled to receive 1s. per day country allowance. If employed on country jobs over three miles and up to 20 miles they demand their third-class railway fare in and out every week; up to 30 miles once a fortnight; and up to 50 miles once a month; over 50 miles to remain at the job till it is completed. All the time spent on the journeys they want paying for at the ordinary rate of wages, and all journeys back to Chester made in the time of the man except the last journey back to Chester.

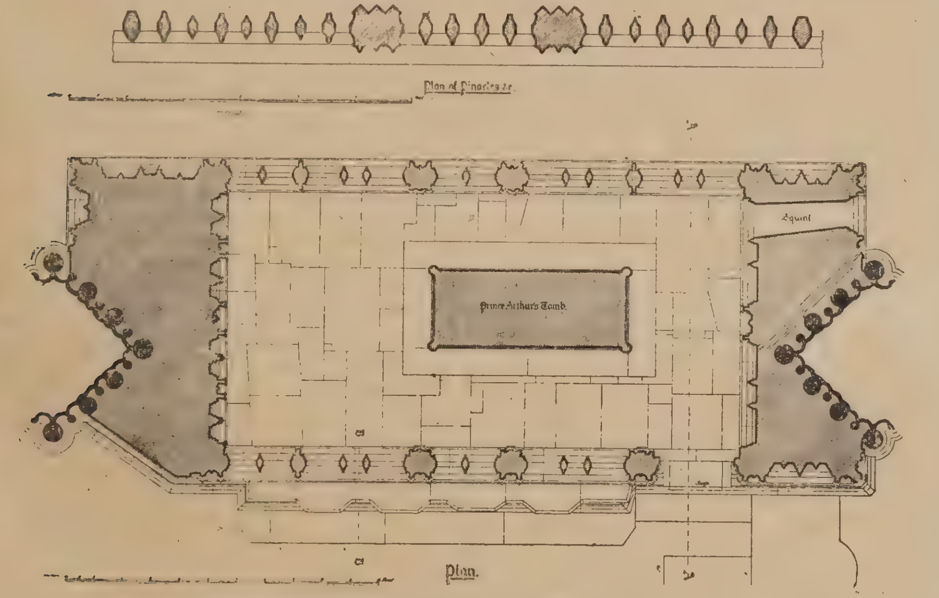
architects of the present time. They had the aid of photography, and possessed materials that the ancients could not command. Labour, again, was as plentiful as formerly. If they would advance, it must be on logical lines, purifying architecture of its "Billingsgate," and aiming solely at that which appeared true and essential.

Church Crafts League. AT a recent meeting of the Church Crafts League (the Lord Bishop of Rochester occupying the chair), the subject for discussion was "The Present Disuse of Art in the Church: its Reasons and Results," and the chairman called on Dr. Biggs to read his paper on the subject. Dr. Biggs prefaced his remarks by calling attention to the attempts which the Church had made towards Art in the latter part of the nineteenth century, as instanced in such buildings as All Saints', Margaret Street, Keble College Chapel, and several others. He also dealt with some of the difficulties which clergy and committees had to meet in dealing with artists. In his opinion greater accuracy of detail was wanted in the artistic treatment of biblical scenes and subjects. Many people visited Palestine now, and these travellers were often disappointed because the actual country was so unlike any representations of it they had seen in their churches. At the same time he appealed to artists to treat sacred subjects in the traditional manner which had been laid down by the Church, and which distinguishes sacred art from secular. Mr. Lionel Cust, F.S.A., the next speaker, referred at length to the historical view of the subject, pointing out the causes which led to the practical abolition of Art in our churches at the time of the Reformation. Mr. Selwyn Image disagreed with Dr. Biggs as to the distinction between sacred and secular art. Art was a man's self, and his individuality must impress itself on everything that he did. In work intended for a church the artist confined himself to certain subjects, and in work intended for a drawing-room he dealt with other subjects, but beyond this there could be no further distinction between sacred and secular art. He reminded the meeting that in days when Gothic churches were built people also built Gothic houses. Every artist had an individuality and each age had a style. Therefore, if any person or firm offered to do work in any style required, it might be taken for granted that the work would be bad. Although we lived in an age which (for many social and economic reasons) had no style, yet every artist had an individuality, which must impress itself on everything he did. After an interesting discussion in which Canon Armitage Robinson, Mr. H. Wilson, Mr. John P. Seddon, Mr. W. S. Frith and Mr. T. Stirling Lee took part, the Bishop of Rochester expressed his appreciation and thankfulness for the remarks made. The two professions had much in common, and the Church Crafts League would justify its existence if it only called together such meetings as the one they were having that evening. The next general meeting of the League will be held early in May. Any non-members caring to attend will be very welcome. Tickets can be obtained from the secretary of the League at the Church House, Westminster, S.W.



PRINCE ARTHUR'S CHAPEL, WORCESTER CATHEDRAL.

Site of the New County Hall. ONE of the first things of importance to come before the new County Council will be a proposal to provide a new county hall. "We have good authority for saying," says the "Daily Chronicle," "that a site has already been valued for the Council's proposed new home. When the scheme is disclosed, it will be found that the site is not on the line of route of the new thoroughfare from Holborn to the Strand, as it was believed would be the case, but is in a prominent part of Westminster. It is estimated that the cost of the new municipal buildings, including that of the site, will not fall far short of two millions sterling."

Register of Old London Buildings. PART I. of a "Register" of buildings of historical or architectural interest in the parishes of Bow, Poplar and Bromley has now been completed and will shortly be on sale. The work was begun by the "Committee for the Survey and Registration of the Old Memorials of Greater London," but three and a half years ago it was taken over by the London County Council. In this first part the most interesting section deals with Tudor House, Bromley, which Mr. Laurence Gomme, the secretary of the County Council, and other antiquaries made so gallant an effort to preserve some years ago. Bromley Hall and the old Palace of Bromley also figure in the volume, which is well illustrated.

The Cargo of Greek Statues. ON page 83 of last week's issue we drew attention to the remarks made by the Athens correspondent of the "Times" with regard to the Greek statues and other objects of art recently recovered from the bottom of the sea near the Island of Cerigo. This gentleman came to the conclusion that the statues formed part of the cargo of the ship in which the conqueror Sulla deposited many of the great masterpieces of Greek art, and that therefore they have been at the bottom of the sea for perhaps 2,000 years. Mr. George Middleton held the opinion that instead of being under water for so long they had only been there since the coasting vessel carrying Lord Elgin's marbles was shipwrecked. The present Lord Elgin now writes to the "Times" as follows:—"The story of the loss of the *Mentor*, and the idea that some of the marbles that were on board of her may still be found in the sea off Cerigo, have made their appearance several times in my recollection. Perhaps you will allow me to mention that on the first of these occasions, some thirty years ago, I consulted the then keeper of the department of Greek and Roman Antiquities in the British Museum (Mr. Newton), and that we were satisfied, after an examination of records in the Museum and in my possession, that the cargo had been recovered and brought to England. In any case the present interesting discovery carries us back to another and more ancient disaster, for the bronzes of which it consists were certainly no part of my grandfather's collection." Photographs of the statues were exhibited recently at a meeting of the Hellenic Society.

APPRENTICESHIP IN THE BUILDING TRADES.

MR. JOHN GOOD (hon. secretary of the Dublin Master Builders' Association) delivered an address last week before the Architectural Association of Ireland on "Some Aspects of the Labour Question as Applied to the Building Industry." He urged that the present condition of affairs made it imperative to educate more thoroughly and more efficiently the mechanic who produced the work; as what the public wanted was a good article produced at the cheapest rate. The building industry in Dublin was a large one, comprising about 7,000 hands. It was generally recruited from apprentices, indentured and unindentured, for improvers. The indentured apprentice system—a very ancient one—had been found to yield the best results, although it was capable of immense improvement, both in instruction, inspection and examination. The conditions of apprenticeship varied considerably in the different trades. In the carpenters' and joiners' the apprentices were principally bound to the employers, and there was no limit as to numbers. But the percentage of apprentices and improvers in Dublin was too small, being 22·8 per cent. instead of 33·33. In the second largest skilled branch of the building industry—the stone and bricklayers'—the apprentices were required to be the sons of members of the trade; but under some circumstances the rule was relaxed on the payment of a £30 fee. One would scarcely have thought that this hereditary or "caste" system could exist in these enlightened days. There were only 3·2 per cent. of apprentices in this trade, and 1 per cent. of improvers—less than one apprentice and improver to every 24 men, instead of one to three, or 33·33 per cent.—the necessary number to keep the trade in a healthy and efficient state. In the plastering trade, where the "caste" system in regard to apprentices also prevailed and no improvers were allowed, there were 25 per cent. of apprentices, or 8·33 per cent. below the necessary number. In the stonecutting trade, in which, except under extreme circumstances, the "caste" system also prevailed, the percentage of apprentices was 19. In other words, in the entire trade there were 17·75 on an average of apprentices, as against the necessary 33·33 per cent.—an appalling deficiency of 600 being the result. Thus sufficient men were not being trained to fill the gaps in the ranks, tradesmen were coming from other places to fill the positions, and thousands of able, but unskilled, hands were forced to seek a living elsewhere. The speaker, having pointed out the necessity of a sound theoretical training and practical instruction in these trades, in which there were no standards at present, said that the work of technical instruction should be in the hands of a public or Government department, and he trusted the present system would soon be amended through the exertions of the new Department of Technical Instruction, for which they owed a deep debt of gratitude to Mr. Horace Plunkett.

Normanton Church.—A faculty has been granted authorising the enlargement of the parish church and the removal and re-interment of bodies which would be interfered with. The cost of enlarging the church will be £3,000,

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Flemish Architecture.

CARDIFF.—WALES writes: "Kindly recommend a book on Flemish architecture. Are there any (such as Brandon and Collins' 'Gothic') fully illustrated?"

No book has been published on Flemish architecture, but the book we should recommend would be "La Renaissance en Belgique et à Hollande," illustrated with 384 lithographed plates of façades, details in stone and wood, carved architectural ornaments, furniture and woodwork, iron and metal work, from some of the most remarkable buildings in Antwerp, Andenarde, Amsterdam, Breda, The Hague and other historical towns. The examples are selected by Professor Ewerbeck and Messrs. Mouris and Lietew, and the work was published in two volumes, half morocco, royal folio, £7 10s., 1891. A very similar book is "Ortwein: Deutsche Renaissance," a collection of 300 lithographic plates from the large compilation of Ortwein and Scheffers published at £36 (out of print), second edition. The illustrations comprise examples of various ornamental and architectural details, including elevations, sections, specimens of stone and woodwork for doors and doorways, windows, balconies, designs for fountains, sculptured capitals, &c.; two volumes, imperial folio, 1893, cloth, 28s. These books are obtainable from Mr. B. T. Batsford, 94 High Holborn, W.C.

Salary in Arrear.

CONSTANT READER writes: "Would an architect's assistant receiving a weekly salary be entitled to payment in full of any salary owing in the event of his employer becoming bankrupt? Does 'salary' come under the heading of 'wages'?"

Yes. "Salary" is the same thing as "wages," and an architect's assistant can claim payment in full of any salary, not exceeding three months', that may be due to him at the date of bankruptcy of his employer, and in priority of all other creditors, except others situated like himself. G. A. T. M.

Permission to Measure French Government Buildings.

LONDON, N.—E. L. G. writes: "Where can I obtain permission to measure and sketch buildings belonging to the French Government, such as the Louvre, Luxembourg Palace, &c.?"

Application should be made by means of a letter written in English to the French Minister of Public Works, stating the buildings which it is proposed to sketch, including any cathedrals. This letter had best be sent in an unsealed envelope and enclosed in a covering letter to his Britannic Majesty's Ambassador at Paris, asking him to be so kind as to forward it to the proper quarter. If it were accompanied by one of the R.I.B.A. travelling cards it would be the more likely to receive attention. We would suggest that the secretary of the Institute might be seen and his advice taken. G. A. T. M.

Pupils' Articles.

LONDON, N.W.—R. G. writes: "Nearly six years ago I was taken into an architect's office without any premium on the understanding that I was to remain there for three years without any salary. I am now about to leave. My principal would give me my articles dated back, but fears it may be illegal. Should the articles be on stamped paper? If so, what would be the best method of getting over the date?"

We would suggest that the case would be perfectly well met by a carefully worded testimonial from the employer stating that Mr. .... had served him from .... to .... in all respects as an articled pupil, though no indentures of apprenticeship had ever been formally entered into. A few words as to steadiness, attention to work, and progress made might then be added, when the document would become as valuable evidence as articles themselves, and could be produced instead of them if ever they should happen to be called for. G. A. T. M.

War Department Building Prices.

CARDIFF.—STUDENT writes: "I should be glad to know where I can obtain the 'War Department Schedule of Building Prices' which is revised triennially."

We have known several attempts to obtain copies of these schedules, but have never known them to succeed without official authorisation. The published price is 12s. 6d., and the publishers are Messrs. Harrison and Son, St. Martin's Lane, W.C. G. A. T. M.

Ball-room Floor.

AMBLESIDE.—PUMPS writes: "To give the necessary spring, with stability, in order to make a good ball-room floor, what is the best method to adopt, and what size joists would be required to construct the floor of a public hall 45ft. by 25ft.? It will be on the ground floor, with no basement."

The common rule for fir joists is half-span in ft. + 2 = depth of joist in inches, and thickness $= \frac{1}{3}$ depth. Suppose there be two sleeper walls, the span would be, say, 8ft., and the scantling by above rule 6 by 2, but this would be rather light for dancing upon; 7 by 2 would be more suitable. This would, however, give rather a stiff floor. With a single sleeper wall down the centre and 9 by 3 joists there would be more spring in it; but for full span of 25ft. without sleeper walls timber joists would not be sufficient, as 11 by 3 is only suitable up to 15ft. span. HENRY ADAMS.

Construction of Regenerator Furnaces.

LONGTON, STAFFS.—T. T. writes: "Where can I obtain full particulars of the construction of a regenerator furnace, similar to that used in connection with the Hull crematorium lately illustrated in the BUILDERS' JOURNAL? I understand the principle, but am at a loss as to the position and working of the air-flues."

We are unable to say where the desired information may be found. A member of the staff engaged on Siemen's regenerative furnace work expresses the opinion that the best plan would be for our correspondent to try to examine the furnace at the Hull crematorium. It is perhaps opportune to mention that among the list of patents published in our last issue was one (2,663 of 1900) for regenerative furnaces taken out by W. P. and G. B. Gibbons, Dibdale Fireclay Works, Lower Gornal, Staffs. A specification of it could be obtained for 8d. from the Patent Office, Southampton Buildings, Chancery Lane, W.C.

Alterations Involving Unspecified Work.

ELGIN.—R. B. P. writes: "I am carrying out alterations to a house in which I find that a very considerable amount of extra work will be necessary, including a good deal of work for which there are no rates in the schedule. Can I expect this extra work to be carried out at the schedule rates or such other rates as the quantity surveyor may determine—the ordinary clause as to alterations and additions to the work being observed—or will not the contractor claim in respect of work for which there is no schedule rate such rates as he may determine by time and material, always remembering that the work is the reinstatement of old work by new?"

In such a case as this it is generally most equitable to determine the charges by time and material, for which properly vouched accounts should be rendered weekly. Something of the sort may always be expected where alterations are to be made, and the schedule, if drawn up with forethought, will contain items of labour at per hour for different tradesmen, and also items of the principal materials likely to be used, in small amounts, such as bricks at per 100 and mortar at per hod. G. A. T. M.

Contract Stamping.

HALIFAX.—X. Z. writes: "Is a 6d. stamp sufficient for a contract?"

Unless the contract is under seal, when it would become a deed, a sixpenny agreement stamp is sufficient. A postage stamp of this value may be used, but it is best to take the agreement within a fortnight of its signature to a post office, when it will be sent to Somerset House to have the proper stamp impressed upon it. G. A. T. M.

Sewer Velocity.

WELLINGTON.—VELOCITY writes: "A sewer is 20in. diameter, 2,500ft. long, with a fall of 4ft. Running quarter-full and half-full, what is the velocity in feet per second in each case, and would such velocity be sufficient to make the sewer self-cleansing?"

The velocity of the sewage flow in a sewer 20in. diameter, laid with a gradient of $\frac{1}{625}$ (4ft. in 2,500ft.), when flowing one-quarter full is 1·85ft. per second; and 2·41ft. per second when flowing one-half full. To provide thoroughly self-cleansing drains and sewers, it is necessary that the velocity of the sewage flow through drains of less than 12in. diameter should be not less than 3ft. per second when flowing one-quarter full. For sewers 12in. to 24in. in diameter a velocity of $2\frac{1}{2}$ft. per second should be obtained when flowing one-quarter to one-half full, whilst for larger sewers the velocity should be not less than 2ft. per second. A slight additional fall is necessary to ensure the 20in. sewer being self-cleansing.

T. E. C.

Cubing Contents of Hopper.

EDINBURGH.—G. M. writes: "I shall be glad to know how to calculate the cubic contents of a grain hopper for a stable. The mouth measures 3ft. by 5ft., and has straight sides for a depth of 1ft. The hopper then tapers like a funnel, the total length from mouth to neck being 2ft. 9in. Is there a fixed size for a bushel of corn?"

For cubic contents of hopper, parallel part $= lbd = 5 \times 3 \times 1 =$ ... ... 15.

Frustum of pyramid $\frac{1}{3}h\,(A + a + \sqrt{A \times a})$, $h =$ 1ft. 9in. $= 1{\cdot}75$, $A = 5 \times 3 = 15$, $a =$ 1ft. $7\frac{1}{2}$in. × 9in. $= 1{\cdot}625 \times {\cdot}75 = 1{\cdot}21875$, then $\frac{1}{3} \times 1{\cdot}75\,(15 + 1{\cdot}21875 + \sqrt{15 \times 1{\cdot}21875}) = \frac{1{\cdot}75}{3}(16{\cdot}21875 + 4{\cdot}275) =$ ... ... 11·955.

Small parallel part 1ft. $7\frac{1}{2}$in. × 9in. × $1\frac{1}{2}$in. = ... ·15234.

Top of trunk $h\left(\frac{L+1}{2}\right)b = 9''\left(\frac{1'\,7\frac{1}{2}'' + 1}{2}\right)$

$9'' = {\cdot}75 \times {\cdot}75 \times \frac{1{\cdot}625 + 1}{2} =$ ... ... ·7383.

Total contents $15 + 11{\cdot}955 + {\cdot}15234 + {\cdot}7383 = 27{\cdot}8456$ cub. ft., 6·232 gals. in 1 cub. ft., 8 gals. in 1 bushel, therefore $\frac{8}{6{\cdot}232} = 1{\cdot}2837$ cub. ft. in 1 bushel, and $\frac{27{\cdot}8456}{1{\cdot}2837} = 21\frac{7}{10}$ bushels in hopper above floor line.

HENRY ADAMS.

Workmen's Compensation.

HOLMFIRTH.—ACKERSPIRE writes: "A stone-dresser is engaged in his work when a piece of stone from one of the hammers (not his own) cuts through one eye and completely destroys the sight. This will totally incapacitate him from his ordinary occupation. His employer now asks him to send in his claim under the Workmen's Compensation Act. (1) What can he claim—a lump sum or an annuity? (2) If a lump sum, what should be the approximate amount, or if a weekly sum how much per week? He earned about 30s. per week. (3) What procedure would you advise?"

(1) The man has a good case under the Workmen's Compensation Act, provided he gave notice of the accident as soon as possible after the happening thereof, and before leaving the service voluntarily. After the second week he is entitled to a weekly payment during his disablement not exceeding 50 per cent. of his average weekly earnings during the previous year. If he has not been so long employed,

then the average will be taken on his wages during the time he was in the employment of the same employer, which apparently would be 15s. a week. (2) See previous answer. (3) The Act has puzzled the Court of Appeal, and nothing should be done without consulting a solicitor. A. O. H.

Brick Walls and Rough-Cast.

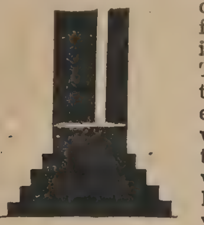
LONDON, W.—A. W. P. writes: "Is a one-brick wall with cement rough-cast sufficient for a gentleman's small country cottage? Would it exclude the damp? How is the rough-cast specified?"

Nothing could be more suitable, while it would exclude the damp perfectly, except in a position where it would be exposed to frequently-recurring driving rain. The specification might run somewhat as follows:—"Render the walls externally where coloured yellow on elevations with Portland cement mortar, in the proportion of 1 of cement to 3 of sand, and cover this with a thin setting coat of neat cement on to which a mixture of peagrit pebbles, ground stone lime and colouring matter to approved tint is to be dashed while wet. Properly form in same all window reveals, angles and weatherings to string courses." G. A. T. M.

Footings for Hollow Walls.

HOVE.—FANTINA writes: "Kindly show the proper method of laying bricks in the footings required for a hollow wall so as to comply with the usual by-laws, namely, that they shall be in regular offsets with the bottom course of footings double the thickness of the wall. Should a 9in. wall be on the inside or not?"

The brickwork should be solid up to damp-course level, with footings formed as usual, as shown in accompanying sketch. The 9in. wall should be on the inside, so that all joist ends may rest in a dry wall, and the thicker portion be provided for weight-carrying. An illustrated article on hollow walls was published in the issue of the BUILDERS' JOURNAL for January 16th last. G. A. T. M.



English Tour for Architectural Student.

EDINBURGH.—STUDENT writes: "I intend to travel for four months this summer in England for the purpose of studying old work, especially Gothic, between about 1200 and 1400. I should be glad if you could suggest a useful tour, and indicate a few of the most important buildings worthy of study."

We would suggest that the time be divided into periods of three weeks or a month each, and be allotted to districts somewhat as follows, more attention being paid to small churches and houses than to cathedrals, and permission to sketch obtained in advance in every case. *Oxfordshire* (principally Norman).—Christchurch Cathedral, Oxford; St. Peter's in the East, Oxford; Tewkesbury Abbey; and churches at Barton, Begbrooke, Cassington, Great Barford, Handborough and Iffley. *Yorkshire* (principally Early English).—York, Beverley and Ripon Minsters; Selby, Fountains, Whitby and Rivaulx Abbeys; and churches at Adel (Norman), Skipton, Hedon and Patrington. *Lincolnshire* (principally Early English).—Lincoln Minster; Crowland Abbey; and churches at Stamford, Heckington, Navenby and Grantham. *The Nene Valley*, *Northamptonshire* (principally Decorated and Tudor).—Peterborough Cathedral; churches at Oundle, Northampton, Warmington, Polebrook, Fotheringay and Castor; and Lyfden Hall. *Essex and Suffolk* (principally Perpendicular, flintwork).—Churches at Lavenham, Long Melford, Ufford, Cromer, Coddenham and Heigham; Norwich Cathedral should also be visited. Numerous other districts are equally good, while each of these contains much more good material than is indicated. Kent, Gloucestershire, Somersetshire and Cheshire are particularly rich, and the work of each district is distinct. G. A. T. M.

Brickwork.

LONDON, N.—STUDENT R.I.B.A. writes: "(1) How can you renovate old brickwork to make it look like new? (2) In the interior of a public building when the brickwork is to show, and not to be plastered, how can you make a good job? Is it customary to distemper the brickwork under such circumstances?"

(1) The joints may be raked out, the whole surface rubbed down smooth and made good where necessary with coloured cement, and the joints repointed. Cement pointing is best, but if a glaringly new appearance be needed tuck pointing in narrow lines of white putty is generally used. It must be remembered that to rub away the old face of the brickwork destroys its durability while giving it temporarily a new appearance. (2) Well-selected facing bricks of even colour pointed in blue-ash mortar looks very well internally, and is frequently used in brick churches. The surface can be distempered, but it rarely looks well, and this is not often done except for workshops. On the other hand carefully-selected glazed or salt-glazed facing bricks of various colours can be made to look very handsome, but the jointing should be narrow and in cement.
G. A. T. M.

Architecture of Holland and Belgium.

DUTCH writes: "Are there any standard illustrated works on the architecture of Holland and Belgium?"

See reply concerning Flemish architecture on the previous page.

Right of Light.

HECKMONDWIKE.—IN DOUBT writes: "A wishes to alter his premises by bringing out the front to the building line of the street as shown in sketch (not reproduced). Can B object, as he has a window into passage?"

As B's ancient light would undoubtedly be obstructed, it would be best to come to terms with him before commencing operations. Probably, as the window is small, it is not used for any purpose for which much light is required, and the money value of any damage done would then be merely nominal. If it light a larder or a W.C., for instance, no judge would award damages at all; yet even in such a case it is best to arrange terms amicably in advance.
G. A. T. M.

Makers of Large Clocks.

CHESTERFIELD.—F. C. R. J. writes: "Kindly give the names and addresses of some large clock manufacturers."

Sir John Bennett, Ltd., 65 Cheapside; J. W. Benson, Ltd., Ludgate Hill, E.C.; E. Dent & Co., 61 Strand, W.C.; J. J. Stockall & Sons, 6, 8, and 10 Clerkenwell Road, E.C.

Valuer's License for Architect.

HALIFAX.—QUESTIONER writes: "Is it necessary for an architect to hold a valuer's license when getting out builders' final accounts in connection with extras and deductions in contracts?"

There is no necessity for an architect to hold a valuer's license for this purpose, nor is it usual. G. A. T. M.

Signing Contracts.

HALIFAX.—TOMAS A DOUTER writes: "When a partner signs the name of his firm on a contract, should he write his own name or initials under the firm's title? Should the witness do the same?"

The firm's signature is quite sufficient, each partner having the legal right to use it. Similarly the witness is witness to the signature of the firm and not of the individual. G. A. T. M.

A Church Set on Fire by Lightning.—Last week the German Church adjoining the German Hospital in Ritson Road, Dalston Lane, London, N.E., was struck by lightning. The organ loft and the choir gallery were burnt out. The organ was completely destroyed and the pipes melted.

Professional Practice.

Barry Dock.—A new fire-engine station has been erected in Court Road. The site of the station is adjoining the Barry Dock Police Station. It has a main frontage of 40ft. to the Court Road, abuts on Watson Street at the rear, and is centrally situated in the town. The building is three storeys high and, in addition to the engine-room, contains superintendent's and firemen's apartments, watch-room, stables, and hose-drying tower, 60ft. high. The main building consists of engine-room, 36ft. by 25ft.; watch-room, 15ft. by 11ft.; store-room, 12ft. by 6ft.; and stair-well, 11ft. by 6ft. Outbuildings: Stables, 25ft. by 12ft., containing two-stall and loose box with a large loft above, 16ft. by 12ft.; harness-room, 12ft. 6in. by 7ft.; workshop, 12ft. by 8ft.; three coal houses, 7ft. by 3ft. 9in., and yard. The first and second floor consist of bedroom and other domestic offices. The hose-drying tower is 7ft. by 7ft. clear, and 60ft. high, and has a door from the bath-room of each floor to a gallery running around the inside. From the highest gallery an iron ladder is fixed to the platform on the tower top, which is roofed by a lead-covered dome. The building has accommodation for one family and about a dozen firemen. The engine-room has accommodation for an engine and escape, the engine being supplied by Messrs. Shand, Mason and Co., London, and the fire escape by Bayleys, London. The main entrance doors to the engine-room are folding, and opened by Messrs. Shand, Mason and Co.'s patent instantaneous fittings, as also are the doors of the stables adjoining the engine-room. A pit for engine-cleaning purposes has been constructed in the yard. The staircase is of stone, and leads from the engine-room and watch-tower to the upper floors. The rooms of the ground floor, outbuilding, stables and yard are paved with Ward's patent granite paving, with the exception of the watch-room, which is floored with flooring boards, the upper rooms being floored with grooved and tongued boarding. The walling throughout is done in stock brickwork, faced with Cattybrook wire-cut buff-coloured bricks, the elevation being relieved with red brick, blocking courses and bands, the window heads and sills and other mouldings being of red sandstone. The engine-room is lined throughout with white glazed bricks from floor to ceiling, the stable being lined with a glazed brick dado 4ft. 6in. high, all the other rooms being finished in plaster. A building has been built in the yard at the rear, consisting of a mortuary 13ft. 6in. by 7ft. 6in., and a post-mortem room 13ft. 6in. by 8ft. 6in. The latter contains a post-mortem table, a sink, wash-hand basin and a fireplace, while the former is fitted with two slate slabs. They are divided by a pair of sliding-doors. The building is lined throughout by white glazed bricks, from floor to ceiling, and is ventilated with louvres in roof. The face work is in buff-coloured bricks, in keeping with the main building. The architect was Mr. J. C. Pardoe, A.M.I.C.E., Surveyor to the District Council. The contractors were Messrs. Jones Brothers, the amount of their tender being £2,785.

Kingseat, Newmachar.—A new asylum is being erected by the Aberdeen City District Lunacy Board. The architect is Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A. Mr. Edgar Gauld is the contractor for the mason work of the asylum, and his tender nearly £30,000. The total cost is estimated at about £100,000. The site is on the north side of the railway. about a mile nearer Aberdeen than Newmachar Station. It slopes pleasantly to the south, and has a background of rising ground, well wooded. The asylum is designed on the model of Alt Scherlutz, in Prussian Saxony, on what is known as the "segregated" system, in which the patients are classified and housed in separate groups, according to the nature of their mental trouble. There will be in all twenty-seven separate buildings, and they will occupy a site of about 30 acres. The rest of the estate will be utilised for farming and gardening work for the patients and for recreation ground. The buildings are arranged in three sections — namely, medical, industrial, and general. In the medical section there are eight separate buildings, as follows :—One hospital, divided into separate wings for physically sick, infirm and recent acute mental cases (bedridden) ; also an isolation ward for suspected cases of infectious disease, two observation villas, two closed asylums and two convalescent hospitals. The industrial section consists of six villas, three for males and three for females, accommodating from 30 to 40 in each, the patients being grouped according to their fitness or unfitness for freedom from supervision and for outdoor work. Villa No. 1 is intended for patients capable of working who are untrustworthy in consequence of restless habits, of delusions likely to render them troublesome or offensive, or of a tendency to run away or to commit offences. Villa No. 2 is designed for patients able to work who require somewhat less day supervision than the former, but who cannot be wholly trusted to themselves. Villa No. 3 is intended for working patients requiring a minimum of day supervision and no night supervision. The general section consists of 12 separate buildings — namely, administration offices and boardroom, kitchen and stores, laundry, workshops, boilers, homes for nurses and female servants, medical superintendent's residence, steward's house, lodges for gardener and engineer, cottages for married attendants, greenhouses, recreation hall, and mortuary. The accommodation provided at present will suffice for 550 patients, and it is proposed that future extension should be met by the erection of additional villas from time to time as required. In view of this prospective addition to the number of villas, the central buildings, such as the kitchen, hospital and boilerhouse, have been made sufficiently large to meet the requirements of an asylum of 700 patients, instead of 550. The patients will dine in the separate villas, their meals being sent from the general kitchen in specially-constructed trollies. It was at one time suggested to have an underground electric tramway for this service, but this system was dropped on the score of too great first cost. The architectural treatment of the various buildings is plain. No two of the villas are exactly alike, and the effect of such diversity will be to impart a picturesque and village-like appearance, without any suggestion that the villas form part of a large institution. The style is the late Scottish Renaissance, and a good deal of effect is obtained by combining the local granite obtainable on the estate itself with some of the other lighter-coloured granites from quarries in the neighbourhood.

Napsbury. — The new Middlesex County Asylum, now in course of erection at Napsbury, near to St. Albans, is situated on a site of about 416 acres, which cost £45,000. The plans for the buildings have been prepared by Mr. Rowland Plumbe, F.R.I.B.A., to accommodate about 1,150 patients, and are to cost some £385,000, or an average of £311 per patient. The designs have been executed on a principle somewhat uncommon to the South of England, the idea being to classify the patients to the utmost possible extent. It will consist, first of all, of a main asylum, much of the usual type, to accommodate 650 patients; next a separate hospital for purposes of admission and observation and medical treatment, accommodating 234 patients. In addition to this separate villas will be provided for working patients of both sexes ; also for male and female paying patients. The usual isolation hospital and post-mortem department will be provided together with a medical officer's house, bailiff's house, and the usual adjuncts. The main asylum will consist of detached wards communicating with the administrative block and each other by means of corridors. The wards are arranged "en eschelon" in order that the fullest benefit may be obtained from the sun's rays. Separate wards are provided for sick and infirm patients, epileptic patients, chronic refractory patients, and a sufficient number of chronic and working patients of both sexes. This building will be built on a plateau sheltered from the north and facing south, with lovely views over the surrounding country. The male and female blocks will be divided in the centre by a large common dining-room, above which will be the recreation hall. North of this will be the kitchen and kitchen offices, and on each side of the kitchen court are placed the dining, mess and recreation rooms, and on the female side a nurses' bedroom block will be also provided. North of the kitchen courtyard are situated the stores, which communicate through a long corridor having various offices on each side with the front administration block. This corridor contains the usual visitors' rooms. The workshops will be arranged in a courtyard set back from the administration block, and forming a separate court, in which are the boiler house, engine house, dynamo rooms, water tower, bakery, and other buildings. The laundry will be also set back, and situated to the west of the front administration block. In connection with the laundry, a proper disinfecting block will be provided, and the mortuary and post-mortem department will be provided in the rear of the workshops. The matron and chief attendant will have separate houses built in the large quadrangles, which will separate the administration block from the communicating corridors. The wards will be two storeys high, the administration block and the nurses' home being three storeys high. The contract for the foundations of these buildings has been let to Messrs. Holloway brothers, builders, of London. The hospital will be arranged on a system as similar as it can be to the main asylum, all the blocks being detached, and communicating by means of corridors. The south blocks are devoted to hospital and convalescent cases. The east and west blocks will be devoted to the sick and infirm cases, for whom a wide sunny corridor will be provided for inclement weather. Verandahs are also provided for these cases. The exercise corridors are divided by the dining hall, north of which is placed the kitchen, and on each side of the kitchen court are the attendants' mess rooms. North of the kitchen court the storerooms are provided. Two blocks of wards for isolation cases are arranged in connection with the last-named wards, but are detached, although communicating by a covered way. In front of these buildings will be provided a set of rooms for the use of the medical staff and nurses, and for the examination of all cases admitted. Right and left of this block are situated the recent and acute observation wards, two storeys high, the other wards being only one storey high. Separate villas for the working patients will be dotted about the estate in positions which will be most convenient for their work. A big dining-room will be provided, with a separate sitting-room and a large recreation room. On the upper floors are situated the bedrooms, with the usual accommodation. The paying patients' villas are somewhat similar in plan, but contain more sitting-rooms. The isolation hospital will contain accommodation at present for only six patients, but there is facility for increasing this should it be required. The medical officer's house will contain a dining-room, drawing-room and study, with the usual bedroom and other accommodation. The bailiff's house will contain two sitting-rooms and four bedrooms. The accommodation in the lodges will consist of a living room, kitchen, and three bedrooms, The buildings will be lighted by electricity.

Keystones.

Mr. W. D. Caröe, architect to the Ecclesiastical Commissioners, has been appointed architect to the Dean and Chapter of Canterbury in room of the late Sir Arthur Blomfield.

The late Lieutenant-Colonel Henry Cowell Boyes, London Rifle Brigade, has bequeathed £100 each to the Architects' Benevolent Society and the Charitable Fund of the Surveyors' Club.

Messrs. Nestlé are pushing forward their milk factory building scheme at Tutbury, the architect for which is Mr. G. Yates Mills, of Derby. Thirteen tenders were received for the work, and that of Messrs. Walkerdine, of Derby, at £9,275, has been accepted. The next lowest was that of Mr. H. Edwards, of Burton (£9,555), and the highest tender was £11,250. The contract is separate from the foundation.

The Roman Paving at Dorchester which was recently discovered has been picked up and relaid in the Dorset County Museum by Messrs. B. Ward and Co., Limited, of 38 and 39 Parliament Street, Westminster.

An Edzell Competition.—The School Board of Edzell some time ago invited a number of architects to submit plans for a new school. On the recommendation of the assessor, the plans submitted by Mr. D. Wishart Galloway, of 2 Market Street, Brechin, have been accepted.

New Sunday Schools at Cowes have been erected by the Wesleyan Methodists on a piece of land having a frontage to both Birmingham Road and Westhill Road, and upon which a chapel is also in course of erection. The entrance to the schools is in Westhill Road, and the chapel faces Birmingham Road. The school proper is about 48ft. by 50ft., is fitted with incandescent light, and is well ventilated. It will accommodate about 400. There is also another room specially set apart for the younger scholars, for whom sitting accommodation for 150 is provided. There are also several classrooms.

The new Roman Catholic Cathedral in Ashley Gardens, Westminster, is now, so far as the shell is concerned, practically completed, and the expenditure incurred in its erection up to date exceeds £140,000. It is Cardinal Vaughan's intention to carry out at once the completion of the campanile, the total height of which, when surmounted by its cross, will be 283ft. Efforts are being made to decorate one or two side chapels with marbles and mosaics before the date of opening, which as yet has not been decided upon. The new Archbishop's house, connected with the apse of the cathedral by a bridge, will, it is expected, be ready for occupation about June.

The Surveyors and Auctioneers' Clerks' Provident Association held its annual general meeting last week, Mr. Daniel Watney presiding. The report showed that the number of members on December 31st was 153, a net gain of 16 on the year. The financial position of the association is highly satisfactory. The income for the year was £542, against £514 for the preceding 12 months. The expenditure was £206, leaving a net balance of £335. Added to the amount brought forward on December 31st, 1899, a grand total of £5,150 is shown. On account of sick allowance £83 has been paid. Mr. J. Payne was elected the hon. secretary in the place of Mr. W. Cudlipp, who resigned his office because of inability to attend the meetings.

Greek Portrait Sculpture.—At the Royal Institution, Professor Percy Gardner recently began a course of lectures on "Greek and Roman Portrait Sculpture." He pointed out that portraits of Greek women were few and far more conventional than those of men, for, though we owed to the Greek chisel some of the most lovely types of female beauty in existence, the Greek sculptor did not revel in the beauty of women as in that of men. In the time of Phidias and Polycletus undignified subjects and unsatisfactory features were avoided, but in the fourth and third centuries a drift could be traced towards naturalism and individuality, although the portraits were free from slavish adherence to details of accident, and the artist set the man before us rather in the manner of Plutarch than of the modern newspaper interviewer.

R.I.B.A. Prizes and Studentships, 1901-1902. The subjects for these prizes are as follows :—*Essay Medal and* 25 *guineas*: Essay on the employment of the Order in Renaissance and modern architecture. *Measured Drawings Medal and* 10 *guineas*: As usual. *Soane Medallion and* £100: Design for a swimming bath for men. *Pugin Studentship, Silver Medal and* £40: As usual. *Godwin Bursary, Silver Medal and* £40: As usual. *Owen Jones Studentship, Certificate and* £100: As usual. *Tite Prize, Certificate and* £30: Design for a royal memorial chapel in the Italian style. *Grissell Gold Medal and* 10 *guineas*: Design for a roof, in iron, concrete and glass, of a picture gallery. *Ashpitel Prize*: As usual. *Arthur Cates Prize*: As usual. Copies of the pamphlet containing full particulars of these prizes may be obtained at the office of the Royal Institute of British Architects, 9 Conduit Street, W., price 3d. each

Queen Victoria Memorial.—The committee appointed by the King recommend that a memorial be erected in the neighbourhood of the Abbey and Palace of Westminster, or of Buckingham Palace; the memorial to include as its most prominent feature a statue of the Queen. A sub-committee has been appointed to consider the means which should be employed to carry this recommendation into effect. Subscriptions will be received by the Lord Mayor at the Mansion Houae, E.C., and at the Bank of England.

Peabody Buildings.—The governors, who administer the fund of £500,000 left by the late Mr. Peabody for the erection of tenements for the poor, in their thirty-sixth annual report announce that they have invested in land and buildings for the artisan and labouring poor of London £1,290,047. On the Herne Hill estate twelve blocks of buildings of forty rooms each are now in course of construction. The average rent of each dwelling last year was 5s. 0½d., and the average weekly wage of the head of each family in residence was £1 3s. 1¼d.

Paper Houses.—Professor Bickerton, of Christchurch, New Zealand, has invented a new method of constructing houses. The constructive material is brown paper freely tarred over. It is said to present many advantages over the old-fashioned brick-and-mortar system. The cost to begin with is less than one-fifth of that of the cheapest wooden buildings, but it is somewhat strange to learn that the brown paper, when chemically treated, resists wind and weather, and that the houses built of it remain watertight, while their wooden neighbours are leaking. Warmth is secured by double walls with a space of four inches between.

Ballinasloe Church, built in 1842, was almost completely destroyed by fire on May 11th, 1899. It has now been restored. Mr. S. Hill, of Cork, was the contractor. The joint architects are Messrs. J. F. Fuller and W. H. Kempster. The old plan has been adhered to but enlarged, the chancel being extended and a new organ chamber erected. There is a pitch-pine ceiling, and two new Bath stone transept arches add to the symmetry of the interior. The steps to the chancel are of Portland stone, and the walls plastered in dull grey. The seats, like the ceiling, are of pitch pine. The stonework for the new chancel extension was supplied from Brackernagh Quarry, adjacent to Ballinasloe, and worked on the church premises. The aisles are laid with concrete, 1in. lower than the flooring of the pews, and are thus ready for tiling. New louvre windows have been placed in the tower.

Mr. William Wilkinson, architect, formerly of Beaumont Street, Oxford, died recently at the age of 81 years. While deceased was actively pursuing his profession he enjoyed a high reputation as an architect, principally in designing country houses and model farm buildings for noblemen and gentlemen in different parts of the country, and even so far away as Switzerland. He also designed many of the best houses of the Norham Manor Estate, Oxford, and, amongst other buildings, St. Edward's School, Summertown, the Randolph Hotel, Oxford, and the new part of the Warneford Asylum, Headington. He was the author of a very useful work on domestic architecture, entitled "English and Country Houses," published by James Parker and Co., Oxford, which reached a second edition.

New Buildings in Aberdeen.—Plans of the following new buildings have been sanctioned:—Two dwelling houses on the east side of Bayview Road; workshop at rear of premises, 190 King Street, Messrs. Brown and Watt, architects; alterations in connection with premises, 379 Union Street, Mr. John Cameron, architect; shop on the north side of Jasmine Terrace, Mr. James Rodger, builder; electricity works at Dee Village, for the Town Council, per Mr. Alexander Smith, gas engineer; alterations at 8 Castle Street, Mr. R. G. Wilson, architect; alterations in connection with Art Gallery, for the Town Council, per Mr. A. Marshall Mackenzie, architect; and seven dwelling houses on the north side of Fonthill Terrace, Messrs. D. and J. R. M'Millan, architects.

The Chapel of the Pyx, a very interesting remnant of the most ancient part of the conventual buildings of Westminster Abbey, has been transferred to the custody of the First Commissioner of Works. The chapel occupies two bays under the convent dormitory, which extends along the eastern side of the cloisters. The dormitory is now partly used as the great schoolroom of Westminster School and partly as the Chapter library, and the Pyx Chapel under it is now the largest fragment of the Confessor's buildings left to us.

A Leeds Improvement Scheme.—At the local government enquiry held recently at Leeds as to the improvement scheme, by which it is proposed to sweep away the Quarry Hill districts, Mr. E. B. Martin, assistant engineer to the Corporation, said that the population of the Quarry Hill area was 10,577 of which number 9,234 belonged to the labouring classes. There were 254 persons living in lodging-houses. The total cost of carrying out the scheme would amount to £523,034.

Stockport Workhouse Competition.—Mr. Thos. Worthington, F.R.I.B.A., the assessor selected to judge the plans submitted for a workhouse infirmary proposed to be erected for the Board of Guardians of the Stockport Union at Stepping Hill, has given his award. Seven sets of plans had been submitted in competition for the three prizes of £150, £100, and £50 offered by the Guardians for the most suitable plans. The assessor has awarded these premiums as follows:—(1) Messrs. Giles, Gough and Trollope, 28 Craven Street, Charing Cross, London; (2) Mr. H. Percy Adams, Woburn Place, Russell Square, London; (3) Mr. Charles W. Hardy, Rodney Street, Liverpool.

The Glasgow and West of Scotland Technical College Architectural Craftsmen's Society held a meeting last Friday, Mr. Isaac Low, jun., presiding, when papers by Mr. Jas. McKissack and Mr. Jas. Lochhead, A.R.I.B.A., were read on the subject of "Planning of Tenements for the Labouring Classes." Mr. McKissack confined his remarks to tenements constructed on the "Common Close" system with reference to the arrangement of two-roomed and single-apartment houses on the most sanitary and economic principles. The lecturer advocated the desirability of providing a separate W.C. to each house. Mr. Lochhead's paper dealt with that type of dwelling to which entrance is gained from a balcony at each flat with a common stair placed either outside or within. In planning on the "balcony" system, the following points were to be considered: The staircase should be placed outside preferably, and no bedrooms should overlook the balcony, the scullery or W.C. being placed adjacent to this. The site would require to be fairly level in order that the level balcony might serve a sufficient stretch of building.

The T-Square Club is to be congratulated on the success of its first ladies' concert, held last Wednesday evening. The use of the Royal Opera House, Covent Garden, was granted by Messrs. Frank Rendle and Neil Forsyth for the occasion, and everything had been done by the committee for the comfort of the guests, of whom there were about 600. Sir James W. Szlumper, D.L., J.P., M.Inst.C.E., acted as chairman, and carried through a varied and entertaining programme of thirty items. It is unnecessary to single out any one of these for special mention, as all were good. It will be sufficient to mention the names of the performers. The vocalists were Madame Marian McKenzie, Miss Marie Titiens, Miss Norah Maguire and Messrs. Arthur Winckworth, W. R. Maxwell and George Blackmore. Miss Alice Liebman played two violin solos; and the Sisters Skinner gave selections on the banjo. Recitations were given by Mr. A. L. Ebsworth and musical sketches by Mr. Herbert Harvey. Dr. Byrd-Page also gave a clever exhibition of sleight of hand entitled "Ancient and Modern Mystery." During the evening the string band of the Royal Engineers played several popular selections, and it was close on midnight when the company dispersed. It said much for the energy and capacity of the secretary, Mr. T. Wilson Aldwinckle, that such an excellent programme was presented without a hitch.

COMING EVENTS.

Wednesday, March 13.

Edinburgh Architectural Society.—Mr. J. Stuart Syme on "San Micheli and his Work."

Northern Architectural Association.—Annual Meeting at 7.30 p.m.

Edinburgh Architectural Association.—Mr. J. M. Brydon, F.R.I.B.A., on "The Work of Cockerell," 8 p.m.

Sanitary Institute.—Council Meeting at 5 p.m., Mr. Christopher Childs, M.A., M.D., on "Ventilation: Success and Failures of the Methods at Present in Use," 8 p.m.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at Broake, Roberts and Co.'s Chemical Works, Stratford, at 2.30 p.m.

Society of Arts.—Mr. F. B. Behr on "The Proposed High-speed 'Monorail' between Liverpool and Manchester," 8 p.m.

Architects' Benevolent Society.—Annual General Meeting of Subscribers and Donors, in the rooms of the Royal Institute of British Architects at 5 p.m.

Architectural Association (Discussion Section)—Mr. H. P. G. Maule on "The Architect and the Garden." 7 p.m.

Institute of Sanitary Engineers.—Meetings of Examination and Literary Committee at 3 p.m.; General Purposes and Finance Committee at 4 p.m.; Election Committee at 5.15 p.m.; and Sessional Meeting at 7 p.m.

Institution of Civil Engineers.—Students' Visit to the Millbank Street Pumping Station of the London Hydraulic Power Company, at 2.30 p.m.

Thursday, March 14.

Royal Institution.—Prof. Percy Gardner on "Greek and Roman Portrait Sculpture"—III., 3 p.m.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Institution of Electrical Engineers.—Mr. A. C. Eborall on "Polyphase Sub-station Machinery," 8 p.m.

Sheffield Society of Architects and Surveyors.—Paper by Mr. E. W. Mountford, F.R.I.B.A.

Carpenters' Hall, London Wall.—Mr. W. E. Riley on "Dwellings for the Working Classes," 8 p.m.

Friday, March 15.

Architectural Association.—Mr. H. B. Measures on "Rowton Houses," 7.30 p.m.

Epidemiological Society.—Dr. J. T. R. Davison on "The Effects of Sewerage and Water Supply upon the Behaviour of Enteric Fever in Buenos Ayres"; Dr. N. P. Schierbeck on "The Enteric Fever Mortality in Copenhagen from 1828-1898," 8.30 p.m.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers, Part I.—Mr. W. C. Tyndale, M.I.C.E., on "Sanitary Appliances," 7 p.m.

Birmingham Architectural Association.—Mr. Bulkeley Creswell on "Registered Architecture: an Analysis of the Society of Architects' Prescriptions," 6.45 p.m.

Institution of Mechanical Engineers.—Mr. A. N. Connett on "Combined Trolley and Conduit Tramway Systems," 8 p.m.

Sanitary Inspectors' Association.—Annual Dinner at the Holborn Restaurant, W.C., 6.30 p.m.

Saturday, March 16.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration at the Sewage and Destructor Works, Ealing, at 2.15 p.m., conducted by Mr. Charles Jones, M.I.C.E.

Architectural Association.—Third Spring Visit to Stanhope House, Park Lane, W., by permission of the architect, Mr. W. H. Romaine-Walker, 2.80 p.m.

Institution of Junior Engineers.—Anniversary Dinner at Westminster Palace Hotel at 7 p.m.

Monday, March 18.

Society of Arts (Cantor Lectures).—Major P. Cardew on "Electric Railways"—II., 8 p.m.

Surveyors' Institution (Junior Meeting).—Mr. L. S. Wood, P.A.S.I., on "Income Tax, Schedule A," 7 p.m.

Victoria Institute, 8 Adelphi Terrace, W.C.—Rev. T. Hunter Boyd on "The Relation of Religion and Art," 4.30 p.m.

Leeds and Yorkshire Architectural Society.—Mr. Francis Bond, M.A., F.G.S., on "French and English Abbeys" and Election of Officers, 6.30 p.m.

Royal Institute of British Architects.—Mr. C. Harrison Townshend on "The Art of Pictorial Mosaic," 8 p.m.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers, Part I.—Prof. Henry Robinson, M.I.C.E., on "House Drainage," 7 p.m.

Liverpool Architectural Society.—Mr. Neville Hampson on "The Restoration of Ordsall Hall," 6 p.m.

Tuesday, March 19.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers, Part I.—Professor Henry Robinson, M.I.C.E., on "Water Supply, Sources of Supply and Distribution," 7 p.m.

The United Club.—Dinner at the Criterion Restaurant. Mr. Ritchie opens discussion on the "Housing of the Working Classes."

Glasgow Architectural Association.—Mr. P. Fyfe on "Sanitary Dwellings."

Cardiff, South Wales and Monmouthshire Architects' Society.—Meeting.

Architectural Association of Ireland.—Mr. R. C. Orpen on "Architectural Amenities," 7.45 p.m.

Wednesday, March 20.

Society of Arts.—Mr. Percy T. Macquoid on "Evolution of Form in English Silver Plate," 8 p.m.

Geological Society of London.—Meeting at 8 p.m.

Ruskin Society of Birmingham.—The Right Rev. the Lord Bishop of Ripon on "Dante," 8 p.m.

British Archæological Association.—Meeting at 8 p.m.

Sanitary Institute.—Lectures and Demonstrations for Sanitary Officers, Part I.—Inspection and Demonstration in the District of St. George's, Hanover Square, at 2 p.m. Conducted by Mr. Albert Taylor.

THE CREDIT ASSURANCE AND GUARANTEE CORPORATION, LIMITED.
Head Office—10 KING WILLIAM ST., LONDON, E.C.
Capital, £1,000,000. Subscribed, £880,000.

Guarantee of Trade Acceptances & Open Credits.

The Corporation will guarantee Traders 50 per cent. of their credits, at premiums representing only a small percentage of the ordinary trade profits.

Fire. *"Each risk rated on its merits."*

Apart from the Corporation's subscribed capital, which exceeds that of any other Non-Tariff Company, and is larger than that of several of the Tariff offices, it possesses re-insuring resources enabling it to write large amounts.

Workmen's Compensation. *"Non-Tariff."*

The Corporation issues an absolute guarantee against all liability under the Acts of 1897 and 1880, and at Common Law without limit.

Applications for Agencies invited.

Binding Cases may be had on application to the Manager. Price 1s. 9d. each.

CONTRACTS OPEN.

TO BUILDERS.

The Managing Committee of Governors of the St. Pancras Female Orphanage and Charity School will meet at the School House, No. 108 Hampstead Road, N.W., on SATURDAY, MARCH 30th, 1901, at THREE o'clock p.m. to receive and consider TENDERS for the ERECTION of a NEW ORPHANAGE on the existing site, pursuant to plans and specifications prepared by the Architects and Surveyors, H. H. BRIDGMAN, Esq., and SYDNEY G. GOSS, Esq.

Applications for the bills of quantities should be made to Mr. GOSS, No. 3 Broad Street Buildings, Liverpool Street, E.C., on or before MONDAY, the 18th inst.

Sealed and endorsed Tenders, with the names and descriptions of two sufficient sureties, to be sent to me at the Orphanage, on the said 30th MARCH, not later than THREE o'clock p.m.

The Committee do not bind themselves to accept the lowest or any Tender.

CHARLES WORRELL,
Honorary Secretary.

March 1901.

CITY of HULL.

TO BUILDERS AND OTHERS.

The Corporation are prepared to receive TENDERS for the BUILDINGS in connection with a Twelve Cell Refuse Destructor, to be erected in West Dock Street, Hull, including engine and boiler house, chimney 110ft. high, cottage, offices, and slope, but not furnaces.

Forms of Tender and other particulars may be obtained at the City Engineer's Office.

Tenders, endorsed "Tender for Destructor Buildings," are to be addressed to the Chairman of the Destructor sub-Committee, and delivered at the Town Clerk's Office before NOON on FRIDAY, the 29th MARCH, 1901.

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,
A. E. WHITE,
City Engineer.

Town Hall, Hull,
March 1901.

THE BVILDERS' JOVRNAL & ARCHITECTVRAL RECORD

March 20, 1901.
No. CCCXIX.

Effingham House,
Arundel Street,
Strand, W.C.

IMPORTANT ANNOUNCEMENT.

We have to announce that the Builders' Journal *is to be raised in price from* 1d. *to* 2d. *There are reasons which fully warrant this alteration.*

The great increase in the circulation has created many additional demands involving a larger editorial expenditure.

Readers must have noticed how the section devoted to "Enquiries Answered" has grown, but probably they have not contemplated the large additional outlay which this implies. Instead of filling one column these enquiries (which need to be answered by technical experts) now occupy four, five, and sometimes six: moreover, the range of subjects upon which we are asked to give information is becoming more and more extended, entailing additions to the number of our staff and a corresponding increase in the expenditure.

We know that our readers place a high value on this section of the journal and it is our intention to develop it still further.

There will be no journal sold for twopence which will publish so much matter and so many illustrations as the Builders' Journal.

The Builders' Journal *will not only embody the chief characteristics of the original publication, which have made it so successful, but new features will be introduced which will make it still more indispensable both to architects and builders.*

Having thus briefly stated our position, it only remains for us to ask our numerous readers for their continued support.

The new series will commence with the issue for April 3rd next.

An Architectural Causerie.

Chapel of St. Peter-the-Martyr, Milan.

The Chapel of St. Peter-the-Martyr at Milan (the disputed work of Michelozzo Michelozzi, 1391-1472) is a brilliant jewel in the crown of the Italian Renaissance. It is a beautiful unity of architecture and decorative painting. Of noble aspect, it soars up in one of the most populous quarters of the Lombard metropolis and is the complement of a vast Gothic cathedral, St. Eustorgio, to which it is joined at the farthest extremity of the apse. Vincenzo Vecchio was the painter, and the building was finished in the year 1468. The tomb of St. Peter-the-Martyr, which is one of the most prominent features of the interior, is in white marble, supported by red marble from Verona, and is considered to be the *chef d'œuvre* of Giovanni Balduccio, a Tuscan artist of the fourteenth century. In this chapel there is no ornamental abundance, no sign of that abuse of richness which distinguishes the decorative architecture of Lombardian character, of which the front of the Certosa, near Pavia, and that of S. Maria dei Miracoli, at Brescia, are the chief examples. On the contrary we have the Tuscan soberness, which always gives a sense of strength. The ornamental painting triumphs in the cupola, the segments of which are painted with scales, which are red at the base, then yellow, then green, and lastly blue; the blending of these tints is such that the coloured bands one above the other combine in a decorative whole. The frescoes represent four scenes in the life of St. Peter-the-Martyr. The pictures of the entrance arch and those of the arch opposite represent the Annunciation and the Assumption of the Virgin. The tone of the colours is not strong, and harmonises with the delicate scheme of the whole chapel, with the deep green of the pilasters, the frieze—decked with rosy-tinted cherubs—and indeed with everything. The building claims the greatest interest from those who visit it for the purpose of study.

Bridges.

Engineers are not generally associated with æsthetics, and it was therefore a surprise to find a paper on "The Æsthetic Treatment of Bridge Structures" read before the Institution of Civil Engineers (a report of this paper is given on page 123 of this issue). It was, however, a pleasant surprise, and we hope it may mark the beginning of a new era. The first requirement of a bridge structure is to carry the weights which will be imposed on it, but there are also considerations of beauty, though these have received sparse treatment by engineers. It is a fallacy to think that fitness necessarily means elegance: for instance, a bridge may be perfectly suited to its task, and yet be ugly. But the great mistake which engineers have made is in the application of inappropriate ornament with the idea of beautifying their structures. It is needless to cite examples. Mr. Husband, the author of the paper in question, strongly objects to bridges being criticised from an architectural standpoint. We differ from him in this, holding the opinion that the construction of bridges is in many particulars—such as stability, proportion, ornamentation—similar to that of

ST. PETER-THE-MARTYR, MILAN: DETAIL OF DECORATION IN DOME.
MICHELOZZO MICHELOZZI, ARCHITECT. VINCENZO VECCHIO, PAINTER.

buildings, though we admit this has more special reference to masonry bridges than to those of iron and steel. Waterloo Bridge, for instance, is an architectural analogue to Somerset House. However, architects and engineers have much to learn from one another, and we hail with pleasure any indication of improvement. Considerable progress in this direction has already been made in France, where iron roofs and bridges are much more happy in treatment than our own.

Labor ipse Voluptas

ONE of the most extraordinary schemes for obtaining architectural designs is that formulated by a certain gentleman of High Holborn. This gentleman required "sketch designs for a country house" and made his intention known by advertisement. We have before us a copy of the particulars issued by him, which were given to us by an architect who applied for them. The drawings are to be sent in not later than April 22nd next "and marked 'plans' on the envelope, accompanied by a rough estimate of the probable cost." But the sentence to which we would direct special attention is the following: "Such of the sets of drawings as may be selected for any purpose will be retained, for which a sum of five guineas will be paid to the author in each case." We would advise this gentleman not to be reckless in his payments, not to squander like a wanton millionaire. Is it not munificent to pay five guineas for designing a country house, the approximate cost of which is "not to exceed £6,000"? Five per cent. on £6,000 is £300, and we are wondering whether any architect has been fool enough to send in designs on the terms mentioned. "Such of the sets of drawings as may be selected *for any purpose*"—what does this mean? We draw our own conclusions. Such practices as this deserve strong condemnation, and we are only glad that they so seldom occur. When they do, however, they should not be passed unnoticed.

SELJUKIAN GATEWAY, AMASIA.

THE HITTITE CITIES OF EYUK AND BOGHAZ KEOY.*

BY THE REV. G. E. WHITE, MARSOVAN, TURKEY.

FINE spring weather and fine Turkish courtesy from officials, local boys and villagers supplied the outward conveniences for the interesting visit to the cities named above, made by three young Americans of the Marsovan missionary circle in March, 1898. The first night was spent at Chorum, near the junction of the three ancient provinces of Pontus, Galatia and Cappadocia, and the first chapter of First Peter furnished suitable devotional reading that evening.

The next day, an hour before reaching Eyuk, we came to Kalch Hissar, Castle Wall, a double peak rising 500ft. to 600ft. above the plain, with a village of Circassian refugees from Russia at its foot. The peak has some of the crumbling masonry so common in Turkey, but at the summit we found something different. On the topmost of four steps, cut in the rock, once sat an idol or a human figure of nearly life size, the feet resting on the third step and cut from the same stone that formed the step. The feet are broken off at the ankles now, and the rest of the figure is gone. The toes of the shoes are round, not sharp-pointed or upturned according to the usual Hittite custom; but the Hittites did not carve all their shoes with sharp upturned points, and the conclusion seems natural that Kalch Hissar also was a Hittite shrine in the time of the Old Testament.

Eyuk, meaning in Turkish "mound," is built upon a low level mound, in which the villagers say strange stones are sometimes found when they dig for the foundations of dwellings. At one corner of the town the stones remain exposed that once formed a temple, wonderful not for its size or beauty, but for its age and the peculiar character of the Hittite sculpture. Of the building itself nothing worthy is left save the outline of a room about 25ft. by 30ft. square. But the entrance is still guarded by two huge basalt stones about 12ft. high, the face of each of which is carved into the form of a sphinx, with fillet across the forehead, earrings, necklace, and wing-like attachments from the head to the sides of the body. The resemblance is striking to the pictures that come from Egypt. On the inner side of the sphinx, at the right as one enters the temple, is a double-headed eagle with a hare in either talon and a human figure above (almost or quite life-size) supported by a foot resting on the double head of the eagle. On the left was a similar carving, now almost effaced.

The entrance is approached by a double line of huge basalt stones forming a dromos, which presently turns a sharp angle to the right and left. Two processions approaching the temple are represented on these walls. They are a series of human figures cut in bas-relief on the face of the stones, about 3ft. high. They are mostly clad in tunics reaching to the knees with sometimes a loose cloak, draped from the shoulders to the feet, and a skull-cap with horn in front, reminding one of the Egyptian uraeus; shoes are turned up at the point, and the figures have large noses and large earrings. One figure has either a long tassel on a close-fitting cap, or hair depending in a closely-tied queue; either supposition favours a Mongol origin for the Hittites, for the first resembles the custom of the Turks, the second that of Chinamen. Such customs of dressing the hair or covering the head are very persistent in the Orient.

In one case a priest seems to be ministering before an altar, while another priest is dragging a ram by the horn, with three more rams in the field behind and above; another pours a libation upon the feet of a seated goddess. One figure is playing a guitar, another blowing a horn, several have each a lituus, a musical instrument, depending from the hand; a man climbs a ladder half higher than himself and consisting of seventeen rungs. One of the great stone blocks exhibits six similar figures marching; two have bulls, one with something on his back, perhaps an altar; and there are two lions on blocks that have been displaced from the series (the lion is the most characteristic animal of Hittite sculpture). The whole scene clearly seems to be religious, not political or military, and is attributed by Professor Sayce to the thirteenth century before Christ.

PORTION OF OLD SCULPTURE BY THE CASTLE WALL, ZILLE.

Eyuk and Boghaz Keoy are five hours apart, and the latter was evidently a great capital. It is suggested that it was the cool summer abode of the "kings of the Hittites," who were natives of this region, but lived in Syria or elsewhere in winter. The space, enclosed by a wall, is over a mile long by a half mile broad, and contains remnants of three castles and three palaces.. The distance from the top of the wall to what was the bottom of the moat in places exceeds 150ft. in a straight line. These walls were built without mortar, the great rampart of earth being topped by a double-faced wall of large cut stones, the space between being packed with rubble. The outer upper edge of each cut stone has a little turned-up ledge, which prevents the stone laid upon it from slipping outward, while its fellows on either side and the rubble behind would keep it from moving in those directions. The outer slope of the walls is in some places paved with flat stones, which both held the earth and would place invaders at the mercy of defenders. The principal palace was of the form of an Oriental inn, with a series of rooms aroud a large central court. Near by is an overturned chair or throne mounted upon and between lions.

Boghaz Keoy has but one inscription, Nishan Tash, a lettered stone 6ft. by 18ft. in size, but, sad to say, this is defaced beyond decipherment. We were fortunate, however, in securing some fragments of cuneiform tablets and seals, probably Hittite or Mycenean. One of these last had a figure 4 in the centre, surrounded by rope-work, and with a loop at the back for passing a cord through. We found also a whorl of the sort discovered in such numbers by Dr. Schliemann at Troy.

One of the spots which we considered to be

---

* A paper read before the Victoria Institute, London, on March 4th, 1901. [We are enabled to publish the accompanying illustrations through the courtesy of the author.]

TOMB UNDER THE CASTLE WALL, ZILLE.

most interesting is an abrupt rock called "School Rock," two slopes of which have been hewn into the shape of bowling floors. The larger, about 18ft. by 30ft., and as nearly semicircular as the configuration of the rock permits, forms quite an auditorium. The rock faces are cut down 8ft., and decorated with striated lines, and the floor is a series of low broad tiers or stairs. At the focal point the rock has been drilled with several holes, where the platform for players or the bench of a judge might easily have been erected. The whole is a rough but distinct form of a theatre, and the query at once arose, Have we not here a copy of the original of that famous structure, the Greek theatre? If the Hittites of Cappadocia could make sphinxes like those of Egypt, correspond in cuneiform characters with the people of Mesopotamia, and amuse themselves with playthings of a kind more abundantly used at Troy, how natural for them to pass on to the Greeks anything of their own worth while copying, for the Greeks to improve upon. Here is a small rough assembly hall within the walls of a capital and near the throne. Why not a model to the Greeks? The suggestion is made for what it may be worth.

The most important sculptures at Boghaz Keoy are those of Yazili Kaya, two miles from the ancient town. Here again the design is devotional, not military. The larger of two rock galleries contains on its sides a double procession meeting in the middle. The figures are like those of Eyuk, but more in number and of greater variety. The skull-cap gives place to high and flat-topped or high and conical caps, the peak sometimes drawn forward in the "Phrygian" style. Lions, tigers and double-headed eagles support various human forms. Others stand on mountain summits, or on the heads of men. At the head of the two processions, which contain more than threescore figures, a priest and a priestess of gigantic size meet each other with peculiar symbols in their hands. Would that the key to all this were known to us; that we understood what were the thoughts in the minds of the men who carved these images in the rocks long before the time of our Lord! The Hittites faded from history 700 B.C.

The smaller of the Yazili Kaya rock galleries contains other figures like those in the larger gallery. One is an interesting series of twelve men who seem to be reapers, each with his sickle over his shoulder; but they may be soldiers marching with swords. Many places in the region were described to us by the villagers as having "idols and writings" or "lions and dogs," &c., some that we were able to examine yielding nothing interesting. Rock-hewn tombs with Doric columns and a spiral stairway cut through solid rock down to a river, but with no trace of a castle above, aroused our curiosity.

One place, however, the village of Eski Yapar, one hour west of Alaja, deserves special mention. It is built, like Eyuk, on a flat mound in an open plain, and furnishes peculiar stones to the inhabitants when they dig. Apparently the debris of an Oriental village occupied for generations had lifted up the very site of the place above the plain to the height of a man. Here we found several Greek inscriptions on stones used as tombstones, perhaps a thousand years ago. A round column inverted and half-buried proved to be a Roman milestone with the name Cæsar plainly discernible on it. Apparently it was a milestone of Antoninus Pius, well-nigh two thousand years ago, set up to guide travellers on roads long since forgotten. A villager invited us to look at a queer stone built into the corner of his house, and there we found cut in red sandstone rock another figure of a lion. This one had lost its head, and being set up on its tail occupied an awkward and uncomfortable position for so noble an animal and so valuable an archæological specimen. For what can it be but another Hittite lion made and left more than three thousand years ago?

That little village of Redhead, *i.e.* "Shiite," with its relics of three other peoples with their mighty governments, their races, languages, religions, customs and civilisations distinct one from another, and a thousand years apart, and with Doric and Ionic capitals in the near vicinity, is an example of what is waiting for the spade of the explorer and the genius of the archæologist in the soil of Asia Minor.

[On the moment of going to press we have received from Mr. White a most interesting photograph and some particulars of the palace and "theatre" of the Hittites at Boghaz Keoy. These will be published in our next issue.—Ed. B. J.]

OLD GREEK THEATRE UNDER THE CASTLE WALL, ZILLE.

ARCHITECTURAL ASSOCIATION.

ROWTON HOUSES.

By H. B. Measures.

A MEETING of the Architectural Association was held last Friday evening, Mr. W. H. Seth-Smith, president, being in the chair. The minutes of the previous two meetings having been read and confirmed, Messrs. R. H. Murray and C. R. Pinsent were elected members. Mr. H. B. Measures then read his paper, of which the following is a summary:—

Time will not permit of a detailed description of each Rowton House: I therefore propose to describe the house at Newington Butts, containing as it does practically all the essential features of a building of this description and, moreover, because the site is one which both in frontage, depth, and general disposition, is as near as possible an ideal site for the purpose of providing accommodation for 800 men. It is situated in a very crowded neighbourhood, frequented by the class of men who have in the past had to crowd into small houses as the lodger, or go to a common lodging-house, with all its degrading surroundings. For the workman the position is one affording exceptional facilities for access to the heart of London, consequent upon the proximity of railways, including the South London, and the tram and 'bus routes in all directions.

The site has a frontage of 214ft. overlooking a well-laid-out public recreation-ground, the site of the disused churchyard of St. Mary Newington, and is approached by a wide footway from Newington Butts. The depth of the site from front to back is an average of 138ft.

The building is set back from the forecourt railing a distance of 10ft., and as the ground floor is 4ft. above the paving ample light is obtained for that portion of basement which is on the front of the building; at the back the main building is set back a distance of 25ft. from the boundary. This gives a considerable space for light and air whatever the adjoining owners may hereafter do on their land, and, in addition, the dimension just enables the building to be erected without coming within the Building Act angle of 63½ deg.

The central courtyard above ground floor has a width of 58ft. 6in., which is wider than I have been able to obtain at either Calthorpe Street or Whitechapel, the latter being 49ft. 6in. wide; this, I consider, gives ample width, but is not so convenient for planning the ground-floor rooms as a width of, say, 60ft. In all the plans, the plan of cubicle floor is based upon

THE MIRROR TOMB, NEAR AMASIA.

an elongated letter U ; this I consider to be the most satisfactory form for planning, and preferable to an enclosed quadrangle; with the latter it may be possible to produce a large central staircase, but I do not advocate such in preference to those adopted. The shape adopted gives an abundance of light, sunlight, and fresh air into the courtyards, and lends itself to the disposition of staircases at the extremity of each arm. I need hardly point out that with the staircases thus planned it is impossible for a man to be trapped in the event of fire, a thing that is likely to happen with a central staircase unless panic stairs are provided—these are expensive and would probably be overlooked in case of need.

The elevations are built in pressed Leicester bricks and mingled gaults, and the dressings in pinky buff terra-cotta. The whole of the interior walling is built with gault bricks, excepting where glazed brickwork is used. The brickwork throughout the building is in Portland cement. The floors are breeze with steel joists, the breeze covering the underside of joists 2½in., the top screeded over joists for flooring. The front roof is constructed of breeze slabs 4in. thick, with angle iron therein, and the slating nailed direct on to the slabs; all other roofs are flat, of breeze and steel construction, covered with asphalt.

For administrative purposes the house is divided into five sections as follows:—(1) Lodgers' day-rooms; (2) Lodgers' cubicles; (3) Catering section, which includes sleeping accommodation for females employed in shop, kitchen, and scullery; (4) Bed-makers; (5) Superintendent's apartments, with separate accommodation for the office clerk.

For the purposes of this paper I will assume that you are accompanying me upon a tour of inspection, following very much the course that a lodger would take. On entering the building an office is provided in the vestibule, where the lodger makes application for a bed-ticket, for which he is charged 6d.; this frees him to the use of all the day-rooms of the house and separate sleeping accommodation for one night. If he desires to do so, an opportunity is allowed him of renewing his bed ticket up to 9 o'clock at night, before which hour no new lodgers are booked, or he may take a bed for a week by payment of 3s. 6d. A lodger can renew his cubicle from day to day, or by the week, so that he has the exclusive use of it. The office front and its fittings are in polished teak, and a safe is provided for the custody of any valuables or money given in charge of the clerk. Opposite the office - window turnstiles are fixed; these serve as a "moral barrier," it being impossible to use them for checking purposes, as the lodgers are in and out of the buildings at all times. The space beyond the vestibule is a provision not only to give room where there is much traffic, but, in addition, to give sitting accommodation in what is a favourite place with the lodgers to watch the arrivals. These spaces and the corridors leading from them past all the day-rooms to the two cubicle and basement staircases have glazed brick walls from floor to ceiling, with a dado in chocolate and cream-coloured bricks and ivory above. The floor is of cement and granite chippings. Water for drinking is laid on

The dining-room has a floor space of 5,300ft., and seating accommodation is provided for 440 men at tables; a number of extra seats and wooden easy chairs are placed in the room. The walls have a glazed brick dado in chocolate and cream, 4ft. 9in. high, with plastering above distempered to tint. The floor is of oak blocks laid herringbone. The tables and seats are of teak, carried on cast-iron standards, the length being 7ft., giving provision for eight at each table. Four large cooking ranges, with ovens, hot plates, and grills are provided. These are placed out of the line of traffic, and are built into glazed-brick chimney breasts from floor to ceiling; this is necessary, as plaster work becomes discoloured in a very short period.

The portion of dining-room between the front and back wings is, in addition to windows, top-lighted and ventilated by four lantern lights, the whole of the sidelights in which open for ventilation; in addition, all the windows are hinge-hung to fall in above transoms, and casement-hung below, the latter being secured by a latch and usually only opened for cleaning purposes; ventilation flues are also provided in walls.

A lodger may purchase cooked or uncooked food at the shop, or he is at liberty to bring his own purchases from outside and have the free use of the ranges, cooking utensils, and lodgers' scullery for the preparation of such food.

The crockery and service room between the dining and smoking rooms is built in glazed brickwork from floor to ceiling and fitted up with shelving. This is provided for those who cook their own food, and is furnished with pots, frying-pans, teapots, plates, cups and saucers, which are at the lodger's service, and which he leaves where used by him, to be collected by porters, who send them down a lift to the basement scullery.

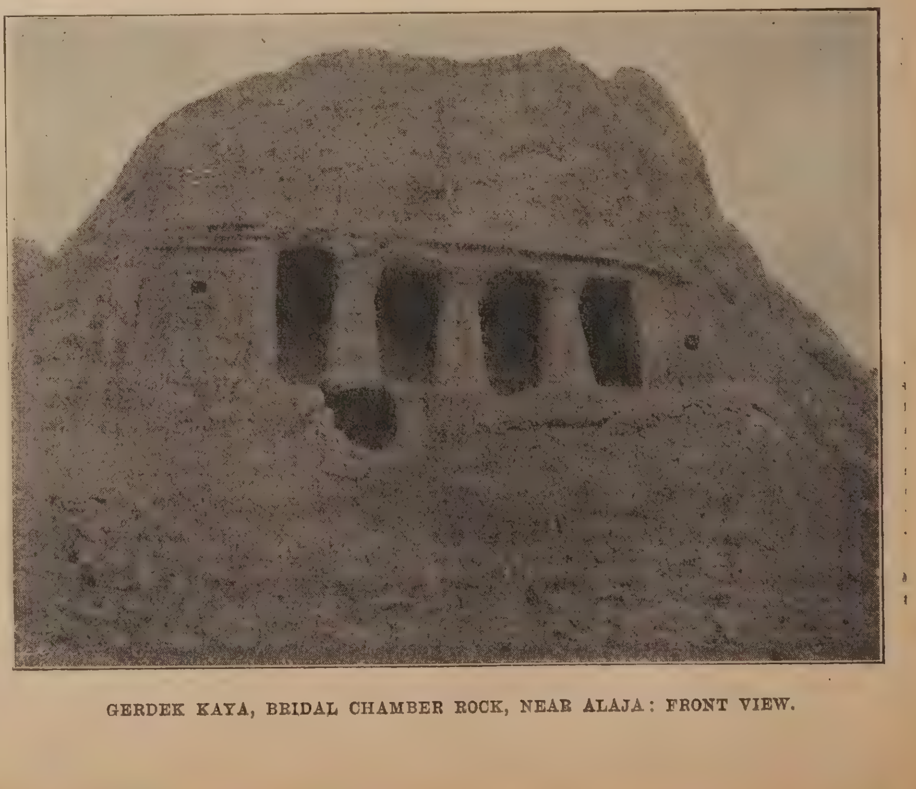
The shop has a teak front with sliding sashes, and is fitted up with counters in teak, hot plates, urns and drawers and shelving for the varied assortment of articles sold. A tobacco licence is held. The prices charged are practically what would be paid outside at a coffee-house. A lift delivers into a service lobby outside kitchen and also into the scullery on basement, and a staircase gives access to same.

The smoking-room is approached from the corridor and from the dining-room. The floor space is 1,600ft., and is fitted up and finished in a manner corresponding with the dining-room; the seating at tables is for 112, with an additional seating accommodation in wooden easy chairs. The chimneypieces are in glazed faïence, and large open fires are maintained. Although this room is called the smoking-room, smoking is allowed in any portion of the building used by lodgers during the day.

At the back of the building is the reading-room. This is an L-shaped room with an area of 2,550ft.; the walls have a glazed-brick dado with plastering above as in the dining-room; the chimneypiece is in glazed faïence. Seats at tables provide for about 170 men, and a large number of easy chairs are provided around the fireplaces. In all these rooms the doors are set into a recessed lobby; this allows them to open outwards without projecting into the corridor, and, in addition, it is possible for the superintendent to obtain a view of the room while standing in this lobby to see that order is maintained. Books are lent to lodgers on application to the superintendent. Games, such as draughts, dominoes, &c., are placed in the room. Cards are not allowed.

Adjoining the dining-room are the locker corridors. The position assigned to these is the most convenient where planning will permit, as they are used for storage of food to a great extent. In the house under notice they are 1ft. 6in. cube, with a shelf dividing into two parts. Of these lockers there is a provision of 800; they are arranged in tiers four in height, and each locker is ventilated and numbered and has a separate key. Above these lockers a number of larger lockers of double the cubic capacity are provided for those who require additional space. Provision is made in them for a stick or umbrella, and a shelf similar to the smaller lockers. The charge for a small locker or a large is 6d. and 1s. respectively, and upon the return of the key 5d. and 10d. respectively is returned, which to a regular lodger is to all intents a charge of 1d. or 2d. for a year or more. In the locker corridors small tables are placed against the piers for brushing or sorting articles in lockers. The corridors are lighted and ventilated at ends by windows, in addition to top lighting and ventilation.

The water-closets and urinals for day use are placed at the rear of the building, and are disconnected from it by a ventilated lobby. The walls, partition walls, and divisions to urinals are all of ivory-glazed brickwork. The roof over is in lantern form, glazed from end to end in T-iron bars, with vertical pivoted louvres.



GERDEK KAYA, BRIDAL CHAMBER ROCK, NEAR ALAJA: FRONT VIEW.

There are 41 water-closets, being a provision of one for every 20 men. The division and front walls are 6ft. 3in. high with a moulded capping and open above; each water-closet is fitted with a flushing cistern, having an iron supply-pipe to pan. The pan and trap used are of the short hopper type, or glazed brick "soap size" is used for risers, and the whole of the space inside same, around pan and trap, up to the top of pan, is filled in solid with cement concrete. This is found to be a perfectly effective means of avoiding breakages, wilful or otherwise. The seats are teak, bedded and screwed down on to the concrete. The doors are kept up 3in. above the floor for ventilation. The door stops and the hinges are slightly out of the perpendicular, the effect of which arrangement is that, excepting when the door is bolted, it automatically opens back on to the division wall, and by that means a lodger is always able to find which water-closets are unoccupied. The door frames are dowelled down to 3in. cement base blocks. The floor of water-closets is laid with a fall towards door, and constructed in concrete with granite chippings. Adjoining these water-closets, near the foot of the main staircase, a room is provided for fumigating bedding or other articles.

At the extreme end of back corridor a staircase is constructed, giving access to the roof over the portion of ground-floor rooms within the centre courtyard; this roof is at first-floor level and is paved with asphalt, fenced in and provided with seats as an open-air lounge and smoking space; it appears to be a much appreciated feature.

Basement.

The two main staircases are continued down at the end of the ground-floor corridors to the basement; a corridor leads from each into the lavatory. In passing I might say that the whole of the basement, where used by the lodgers, is built in glazed brickwork from floor to ceiling, and all the floors are cement concrete finished in cement and granite chippings.

The lavatory has a dado in French grey and ivory, with ivory above. There are eighty basins, fitted with hot and cold water supply, the construction being as follows:—Each set of ten is carried on three divisional walls with angle-iron bearers to carry slate top; the basins are white enamelled fireclay, with outer rim bearing on iron bar on edge, bearers shaped to basin and bolted to outer angle irons. Immediately under the slate top two horizontal water pipes, hot and cold, are carried from rising mains, on main walls, through to end division, with a plug for clearing in the event of a stoppage; branches rise vertically to gun-metal screw-down cocks. Iron waste-pipes are used, discharging over channel in floor; for basins, loose-turned wood plugs are used. The floor is laid with falls to the channels under these lavatories. Towel rails are fitted at ends of ranges and on walls with round towels supplied thereto. Central over each range of basins and running longitudinally a hat and coat rail is fixed.

A portion of the lavatory is screened off by a glazed screen and fitted up with white glazed fireclay feet-washing baths, with teak draining boards between each. Hot and cold water is carried to each, and the wastes discharge over a channel similar to the lavatories. Towels are provided. In the front corridor leading from lavatory to the foot of main staircase there are bath and dressing rooms; the walls are divisional walls 6ft. 6in. high, in glazed work, and the baths are of white glazed fireclay, with a riser of glazed brickwork and finished with a teak top. Baths uncased were tried in the first house, but the space around them, next to the walls, too often proved a receptacle for discarded underwear. Hot and cold water is laid on to each bath. A lodger pays 1d. for a bath ticket, which includes soap and towel; the water is turned into the bath by the attendant. A chair completes the furnishing of bathrooms.

The dressing-rooms are to all intents and purposes as bathrooms, minus the bath. As no lodger is allowed in his cubicle during the daytime, it was considered and found to be necessary to provide accommodation to enable him to change his garments.

In the corridor connecting front and back staircase is a room described as "the lodgers' washhouse," where many wash the whole of their wardrobe of underwear. In the same corridor, adjoining the lodgers' washhouse, is the porter's day room, fitted with lockers, tables, and easy chairs for the officials' use during their leisure and at meal times. On the opposite side of corridor two rooms are allotted to a repairing shoemaker and a tailor, who find constant employment from the lodgers. Returning to the main back corridor there is a space between porter's room and lavatory; this is used as a boot-cleaning and clothes-brushing space, tables and foot-rests being placed therein. A lodger with tools, boxes, or other belongings too large for lockers can, by payment of a small fee, store them in a parcel-room and have access, in company with an official, from time to time. A shop is provided for a barber, who is in constant employment. The knife-cleaning room and the fitter's room adjoin, the latter being fitted with vice, &c., for minor repairs.

In the furnace-room two boilers supply the whole of the hot water used by lodgers for lavatories, baths, &c.; these are connected to two cylinders, each of 250 gallons' capacity, placed in linen and blanket store. A drying-room, fitted with galvanised-iron framework, is built upon the setting of boilers, and utilises waste heat for drying purposes. In the passage outside, at the left end of the buildings, all ashes and refuse from day-rooms is placed in sanitary pails for removal by the authorities by the steps in area. All area walls and voids are in glazed brickwork.

GERDEK KAYA, BRIDAL CHAMBER ROCK, NEAR ALAJA: SIDE VIEW.

Cubicle Floors.

From the ground floor of the building two main staircases give access to the cubicle floors and are carried up the full height of building, with steps of a uniform width of 4ft. 6in. to the flat roofs at top where a gangway is railed in from one staircase to the other, enabling lodgers in case of fire to ascend one staircase and descend by the other. The staircase is built in ivory-glazed brickwork the full height, and the steps are formed of Portland cement with two angle-irons in each; the balusters and handrail are of wrought-iron. On each landing, approached by a door off it, is a sink space with hot-water supply for cleaning purposes, and cold for drinking, carried to a glazed fireclay sink. On each side of the sink space a water-closet is formed for night use only.

Taking the cubicle floor as a general scheme it consists of a central corridor 4ft. wide, extending around the U-shaped building from staircase to staircase. It is divided by partition walls into sections, varying (according to convenience in planning) of from twelve to sixteen cubicles in each. Where possible, I endeavour to plan in sections of sixteen, for a reason which I will explain when dealing with lighting. Among other reasons for the subdivision of cubicle floors into sections are the checking and possible isolation of an outbreak of fire; another advantage is that, in a case of infectious or contagious disease, the isolation and efficient disinfection can be arranged without closing the whole of one floor of cubicles. Swing doors between each section conduce to quietness between each section; fanlights over these open for ventilation. The flooring is yellow, nailed direct upon the screeded breeze floor. The special staircase admits of the women bedmakers obtaining access to the various floors without passing through any of the lodgers' day-rooms. On each floor, including one on each staircase, there are five fitted fire-hose boxes, with glass panel in door for access to bolt.

A typical section of cubicles is planned eight on each side of corridor, handed right and left from the centre of section. This method of handing from the centre is one that I consider most essential; it enables each bed to be against a cubicle partition on the other side of which is the passage space of the next cubicle, and not the bed; any reversal of this arrangement means that sleeping next to a restless or noisy sleeper would be a most unpleasant experience. Every cubicle in the building has its own window opposite the door, leaving a pier against the head of sleeper; those who have had the misfortune to sleep with the head immediately under the chilled atmosphere at a window will realise that this is not a small point in planning. The windows all have a high bottom-bead permitting the raising of sash for ventilation at meeting rails, and the sashes are double hung and of a uniform width of 1ft. 6in. in the brickwork, carried up to within a few inches of ceiling. The framing for cubible partitions is 3in. chamfered frames filled in with 1⅛ V-jointed and tongued boarding painted to a cream shade and twice varnished. The cross partitions are 7ft. 6in. high, and the partition next corridor 6ft. 6in. high; the height of cubicle floors from floor to ceiling is 9ft. The door of cubicle is kept up 2in. above floor for ventilation, and has a bow handle outside and bolt inside. At the foot of bed three hat and clothes hooks are fixed with a shelf projecting over and covering them, making it impossible for garments to be lifted off hooks over the partitions at night by other lodgers (a necessary safeguard). The cubicles are, excepting where breaks on elevations increase their length, uniform in size throughout the building, the minimum standard of 5ft. wide by 7ft. 6in. being adopted; the beds are 6ft. 3in. by 2ft. 6in. over all, the space at the end next corridor permitting the drawing out of the bed for making and the hanging of clothes on pegs; the minimum floor space of each cubicle is, therefore, 37ft. 6in., and the cube air space taking half the corridor for each cubicle is a minimum of 427ft. 6in. To provide for ventilation independent of the windows in cubicles, which the occupants may keep closed, windows are planned at the end of corridors, and these, the fanlights over swing-doors, and the staircase windows, enable the officials to let a current of fresh air through the various sections. On the top floor of building, at the back of sloping roof, is a row of cubicles. These are on one side of the corridor only (excepting in gables, where they are on both), and the dormers on front are a provision for cross ventilation. On each floor two rooms are reserved for officials, who sleep there and are responsible for order. They are fitted as small bed-rooms, and the space from top of partitions to ceiling is glazed for privacy. The staircases are lighted by a point on transom of door leading to sink space. This gives in addition sufficient light into sink space and water-closets through glazing of fanlights and doors. In a section of sixteen cubicles two gas points are sufficient for lighting. Each is set opposite the second cubicle partition from door, and thus lights four on each side. There is not sufficient light for reading in bed, but ample for undressing.

The gas points on staircases and at points in ground-floor corridors are alight all night, and in addition at the change of direction in corridors on cubicle floors a point is also alight all night that a lodger may be able to find his way out at any time. The other gas points are controlled from the office when necessary.

The furniture of a cubicle consists of an iron bedstead, spring mattress, a mattress cover, a horsehair mattress and pillow, two twill sheets, a blanket under same, and any reasonable number over, with a quilt, a wooden chair, and a chamber utensil.

A lodger can go to bed at any time after seven o'clock by presenting his ticket to an official at the foot of one of the staircases. One staircase only is generally used, and found sufficient. He then finds on each floor direction-boards giving the number of cubicles on that floor. Wrought-iron gates bar access to the cubicles during the day, and at night, except by passing an official, these gates are secured by a weak chain and padlock, which the weight of one man will easily break. It is found to answer its purpose as a moral barrier, and its weakness removes possible danger in case of fire. No lodger is allowed to remain in a cubicle after nine o'clock in the morning, at which hour the bedmakers take possession of the various floors.

Catering Department.

The whole of this department is placed in the basement and is accessible only by way of the tradesmen's entrance by passing through the office lobby, or from the Superintendent's private residence. The kitchen is built in glazed work from floor to ceiling, and has a wood block floor, excepting where cooking apparatus is fixed, where red adamantine tiling is laid. Adjoining is the scullery, built in glazed work, with cement floor, fitted with large white glazed fireclay and teak sinks with draining-boards and a large range of plate-racks. A lift from here opens into the lodgers' crockery store above and another into the shop. The larder, the walls of which are tiled, is disconnected from the kitchen by a service passage (in which is placed the lift for kitchen and larder service to shop). A staircase from shop, constructed in teak, gives access to service lobby and also to the corridor to stores and female staff-rooms. There are stores for spare crockery, groceries and provisions, and linen and blankets. Kitchen coals, meter-room and water-closet for catering staff are provided. The staff sleeps on the premises, under the reading-room, and has a sitting-room and five bedrooms; the walls of these are plastered, papered and furnished with pictures, and the floors are wood block. A private door at basement level enables the Superintendent's wife to obtain access for supervision.

Bedmakers.

The bedmakers are not resident upon the premises; they enter the building by a door at the side of the office and descend to their room in the basement by a staircase in full view of office: this staircase is carried up to the first floor of cubicles. A room known as the bedmakers'-room is provided at the foot of stairs, fitted with tables and chairs and a small range for preparation of other meals. Adjoining this room is a cloakroom, fitted with sink and a water-closet opening out of it. A door gives access to the soiled-linen room, which is built in glazed brickwork from floor to ceiling and has a cement floor. The lift delivers from all cubicle floors into here, and the dirty linen is checked into baskets and taken direct away to laundry.

I will now describe in a general manner the three other houses, taking them in their order of erection.

King's Cross House

is erected upon a site which presented a good many problems in planning. There is a frontage of 200ft. to Calthorpe Street and 125ft. to King's Cross Road, with a superficial area of 17,180ft. Generally the construction and materials throughout are as at Newington. The house has cubicles for 677 lodgers. The smoking-room has eating accommodation at tables for 128 men; the floor area is 1,600ft. The crockery store is somewhat small, and more provision is made in other houses. The dining-room has seating accommodation at tables for 376 men, the floor area is 4,000ft. The reading-room has seating accommodation for 112 men at tables; the floor area is 1,528ft. The lavatory in the basement has eighty basins: this is rather excessive, and in the other houses that number is found to be sufficient for 800 men. A basis of one basin for ten men is ample. Water-closets are provided for day use in proportion of 1 in 20; there are too many urinals. In general planning, sizes, and construction the cubicles are as Newington, with the exception that the staircases are not quite so ample, and but one water-closet for night use is placed on each of the various floors.

The Building at Hammersmith

is erected upon a site within 200yds. of Hammersmith Broadway. The site consists of two parallelograms, the smaller of which forms the frontage to Hammersmith Road, the frontage to which is 65ft. by a depth of 102ft. to its junction with the larger, which has a width of 160ft. by a greatest depth of 276ft.; the total superficial area is 44,000ft. The space was sufficient to permit the erection of a building upon the back portion, reserving large areas for light and air, while utilising a portion of the frontage for business premises with a reserved entrance to Rowton House. Materials and construction, excepting in a few minor details, are as at Newington. The smoking-room has seating accommodation for 164 men at tables; the floor area is 2,428ft. The dining-room has seating accommodation for 464 men at tables, the floor area being 5,722ft., and the reading-room for 176 men with a floor area of 3,128ft. The table accommodation in these rooms provides a seat for every lodger, exclusive of easy and other chairs. The lockers here are all 3ft. 1in. high by 1ft. 6in. square, with shelf and space for umbrella: they are placed three in height, and may be taken as a new standard of size.

In consequence of the length of site it was found possible to throw out an arm from the usual U shape towards the north with sufficient lighting, east and west, for the cubicles. This gave such increased accommodation on each floor that the building was built to a height one storey lower than Newington or King's Cross, and still provides accommodation for 800 men.

Whitechapel Building,

the latest of the Rowton Houses, is in course of erection in Fieldgate Street, which runs parallel with Whitechapel Road, and is immediately behind the St. Mary, Whitechapel, Station. It has a frontage to Fieldgate Street of 192ft., and a back frontage of 259ft., by a depth from front to back of 128ft., giving a total area of 29,589ft. For cubicle planning the site is good, and permits of the omission of one storey as compared with Newington, yet gives an accommodation of over 800 beds.

The entrance planning is as in other houses with these differences—the clerk has his bedroom approached from the office by a staircase over the entrance; the superintendent's residence is two storeys in height, and underneath his lower storey a third storey is obtained by lowering the floor (in the height of two storeys of main building) and forming a basement containing bedmakers'-room and porters'-room approached by separate staircases: the bedmakers' by the wooden staircase at end of entrance, and the porters' by a staircase from lower ground floor level under the staircase to reading-room; parcel-room adjoins porter's-room.

The dining-room is chiefly top-lighted, and seats 464 men at tables; the floor area is 5,832ft. The smoking-room accommodates at tables 112 men and has an area of 1,960ft. The lockers are of the size mentioned for the Hammersmith House, and provision is made for one for each lodger. The reading-room seats at tables 144 men, in addition to easy chairs, &c., and has an area of 2,430ft.

A discussion followed in which Messrs. Seth-Smith, Thomas Blashill, A. T. Bolton, C. H. Brodie and H. V. Lanchester took part, and in reply to a vote of thanks Mr. Measures said the reason they got such good work at a low price was that the Rowton House Company were their own builders, and thus there was no inducement to scamp work. There was no system of ventilation in the houses further than the windows and a few flues, which were found ample.

THE NEW CATHEDRAL AT WESTMINSTER.

THE new Roman Catholic Cathedral of Westminster is rapidly approaching completion. It is just off Victoria Street, near Victoria Station. The building is in the Byzantine style, the campanile tower being 273ft. high and the top of the cross 283ft. For nineteen years Cardinal Manning strenuously endeavoured to obtain a site, and when it had been gained it remained for ten years unoccupied. At length, in 1894, Cardinal Vaughan determined to make a beginning. The project was privately submitted to a number of persons, who generously responded, and the first stone was laid on June 26th, 1895. The foundations, which rest on concrete from 4ft. to 10ft. thick, were completed in September of the following year, and now the structural work is so far advanced as to yield some hope that the building may be opened in July of the present year. The work of internal decoration will, no doubt, extend over many years. The building is designed by Mr. John Francis Bentley. It consists of a fine nave, 117ft. high and 60ft. wide, and two aisles with transepts, a baptistery, and eight side chapels. It has a sanctuary 4½ft. above the level of the nave, with the Lady Chapel on one side, and on the other a spacious Chapel of the Blessed Sacrament, behind which are two sacristies and rooms therewith connected. Internally, beside the massive lofty piers, rise twenty-eight marble columns, beside many other columns of granite and marble in various parts of the building. When sufficient money is forthcoming the lower walls and piers, to the height of 38ft., will be covered with marble, and the whole upper part of the piers and walls, and the concrete domes and vaults, will be decorated with mosaic work illustrating the history of the Roman Catholic Church. The nave is higher and wider than any nave in England. An uninterrupted view is given of its great length of 342ft. As to cost, the sum of £134,666 has been paid to contractors, architect, and clerks of works up to December 1st last.

Messrs. Vickers, Sons and Maxim are about to build 200 houses on Walney Island for the accommodation of their Barrow-in-Furness workmen, and it is stated that the firm also contemplate the erection of new works on the island opposite their present shipbuilding yard. The firm already employ nearly 10,000 men at Barrow.

Law Cases.

Compensation for Trade Disturbance.—After a three days' hearing, Mr. John Troutbeck, High Bailiff for Westminster, and a special jury, concluded at the Surveyors' Institution last Thursday the case in which Messrs. Halsey and Davison, cardboard manufacturers, sued the St. James's and Pall Mall Electric Lighting Company for compensation for trade disturbance, the defendants having acquired their premises in Marshall Street, Soho, for the extension of their works and generating station. The amount claimed was close upon £9,000, but the company called witnesses to prove that the payment of about £5,000 would be reasonable. The jury returned a verdict for £6,500.

Claim in Respect of Lead Lights.—At the Hastings County Court the case of *Froy and Sons* v. *Salter* was heard recently. This was a claim for goods sold, £51 19s. There was a counter-claim for damages, which was not admitted.—The defendant, Thomas Salter, a builder, stated that he obtained a contract to build a house in 1897, a Mr. Tree being the architect. It was arranged that the plaintiffs should supply the lead lights, a guarantee being given that they should be executed in a workmanlike manner. In December, 1898, witness wrote objecting to the way in which the work was done, and Mr. Tree complained the following month. In February the plaintiffs sent some men down to set matters right, but in April the architect had to complain again, as the work done had been of little effect. As plaintiffs declined to do anything more, the certificates from the architect were delayed, and witness suffered inconvenience.—His Honour gave judgment for defendant for £29 18s. 6d. on the counter-claim.

Responsibility for Materials supplied.—On March 8th, in the King's Bench Division of the High Court of Justice, before Mr. Justice Channel, Messrs. Edward Bingham, of South Kensington, recovered £152 10s. from Mr. Everett Turner in respect of certain ranges and marble steps supplied by the plaintiffs for the defendant's houses at Brighton. It appeared that the plaintiffs entered into a contract with Mr. J. H. Hackman, a Brighton builder, under which the latter undertook to build four houses in Dyke Road, Brighton, and the question in dispute was whether the plaintiffs were entitled to recover from the defendant, the building owner, or the builder. The action turned upon a certain clause in the building contract which gave the architect power to decide whether the building owner or the builder should be responsible for materials supplied by special artists and tradesmen. The architect certified against the defendant, and his Lordship having found accordingly, judgment was entered against defendant for the full amount claimed.

The Grove Asylum.—In December, 1898, Messrs. Kirk and Randall, builders and contractors of Woolwich, issued a writ against the Metropolitan Asylums Board in respect of a claim for £34,445, subsequently increased to £41,175 4s. 11d., with regard to the building of the Grove Fever Hospital at Tooting Bec, S.W., chiefly on account of damages for alleged delays by the architect, Mr. A. Hessell Tiltman, F.R.I.B.A., of Russell Square, W.C. The action was commenced recently in the Court of Mr. Pollock, Official Referee. The opening statements of counsel occupied four days, and the hearing of evidence on behalf of plaintiffs three other days. At the end of the third day's evidence the plaintiffs made an offer to withdraw the whole of their claim providing they were not asked for costs. This proposal was considered by the Metropolitan Asylums Board in committee, and when the case was again mentioned in Mr. Pollock's Court, on March 5th, counsel stated that an agreement had been arrived at on these terms. Judgment was accordingly entered for the defendants, each party paying their own costs.

Whitewashing a Ceiling is "Repairing" a House.—The case of *Maria Dredge and another* v. *Conway, Jones and Co.* was heard in the Court of Appeal last Thursday. This was an appeal by the applicants from an award of the learned judge of the Gloucester County Court, holding that a workman had not met his death in circumstances that entitled his relatives, the applicants, to the benefit of the Workmen's Compensation Act, 1897. The case was argued in November, and stood over pending the decision of the House of Lords in *Hoddinott* v. *Newton, Chambers and Co.* (reported in our issue for December 19th last). The Master of the Rolls, in giving judgment, said the workman met his death from injuries received by falling from a board supported on two pairs of steps on which he was standing in order to whitewash the ceiling of the room. In his opinion whitewashing a ceiling was not "repairing" a house by means of a scaffold within the meaning of the words of the Act of 1897. But the House of Lords had held differently in *Hoddinott's* case, and this court could but bow to its decision. The appeal of the applicants must, therefore, be allowed; and as the learned County Court judge had found they would be, if his decision as to the law were reversed, entitled to the sum of £253, judgment for that amount would be entered for them, with costs. The other Lords Justices concurred.

What is a Workman?—The case of *Simmons* v. *Faulds* was heard last Wednesday in the Court of Appeal. This was an appeal from an award of the judge of the Lambeth County Court in an arbitration under the Workmen's Compensation Act, 1897. The applicant for compensation was George Richard Simmons, a foreman bricklayer, who was injured by an accident while engaged in a building operation for Andrew Faulds, from whom he sought compensation. The evidence of the applicant was to the following effect:—That he tendered to Faulds for the job in question, giving an estimate of £160, that he started work on that arrangement, that he was to be paid as the work progressed, that he used to draw about 75 per cent. of the work done, that he was not to supply any material, that his tender was for labour and tools, and that he had been working on the job about eight weeks before the accident. The County Court judge was of opinion that although a man was a sub-contractor he might be a workman within the meaning of the Act, and he made an award in favour of the applicant for a weekly payment of £1. Faulds appealed. The Master of the Rolls said that the Act applied to workmen only, and not to contractors, and the evidence was clear that in this case the applicant was a contractor to supply labour. The Lords Justices concurred.

Hoardings around Buildings.—At the Eastbourne Borough Bench, Henry Brewer was recently summoned for failing to erect a hoarding around a certain building, situated at 149 Langney Road, which he was taking down. Mr. Field (building surveyor to the Corporation) stated that he noticed workmen pulling down a house in Willoughfield Road. Slates and brickbats were falling into the road. He told Mr. Brewer that a hoarding should have been erected to avert danger to passengers, and wrote to him on the same day giving him a written order to erect a hoarding. On March 1st nothing had been done, and he therefore wrote to Mr. Brewer again, reminding him that he was liable to a penalty of £5 and a daily fine of £2. He received a reply from defendant to the effect that he was not liable, and that a firm of auctioneers and house agents were responsible. On March 6th one post and a couple of poles were put in front of the building as a fence, but no hoarding was erected. Defendant explained that he placed a board across the footpath to prevent people getting into danger, and he thought that was quite sufficient. The Chairman said it was clear the magistrates could not inflict a small fine, as it would be to the advantage of the contractor pulling down a house not to go to the expense of erecting a hoarding, because the fine would be smaller than the cost of the hoarding, and in that way the contractor would make money by disobeying the law, and at the same time imperil the safety of the public. As the cost of erecting the hoarding would be about £2, they had decided to impose a fine of £2, which would probably be increased in a fresh case.

Screens in Churches.—In the Lower House of Convocation, Church House, Westminster, Sir Arthur Charles, Dean of the Arches, held a special sitting of the Court of Arches last week for the purpose of delivering judgment in the case of the Rev. Charles E. Grenside, vicar of St. Anselm, Pinner, and his churchwardens, with Mr. G. T. Shilbeck (donor of the screen) attached (appellants) and Dr. T. H. Tristram, K.C., Chancellor of the Diocese of London (respondent). In August last the appellants moved in the Consistory Court of London, held in the Wellington Chapel of St. Paul's, for a faculty authorising the erection of a screen in the chapel-of-ease of St. Anselm, Pinner, on which were to be placed representations of Christ on the Cross, with figures of the Virgin Mary and St. John the Baptist on either side. The Chancellor held that the ornament was illegal. A grievance was alleged, and the matter came on in appeal. In delivering judgment Sir Arthur Charles said that the whole question, to his mind, turned on the point whether the screen, if erected in the position in which it was proposed to be placed, could be used as an object of superstitious reverence, or whether it could be merely regarded as a piece of architectural decoration. In cases decided there had been much divergence of opinion Previous judgments, to his mind, went to show that their lordships had no intention to decide that a representation of the Crucifixion on a screen placed in a church could, in any circumstances, be looked on as illegal when erected. He was, therefore, unable to agree with the construction placed on the matter by the learned Chancellor of the Court below. There was nothing in the church in the nature of a rood-loft or beam, and he therefore could not regard the screen as unlawful. The decision of the Chancellor of London was therefore upset.

Removal of Old Building Materials.—In the Commercial Court of the King's Bench Division the case of *Robinson and Co.* v. *Horne and Co* was heard last Wenesday. In November, 1899, the defendants, a firm of auctioneers, sold by auction the materials of a range of buildings forming Reid's Brewery in the Gray's Inn Road, the site having been acquired by the London County Council. The plaintiffs, who are dealers in old metals, bought certain lots at the sale, including four lots of iron girders and columns in the basement, for which they paid to the defendants at a later date £297. The conditions of sale printed in a catalogue issued by the defendants provided that the lots were to be taken down and cleared away from the premises within certain times. The sale took place on November 21st, 1899, but by the following June the plaintiffs had not removed their four lots, and the defendants therefore resumed formal possession of them. The plaintiffs sought to recover in this action the goods in question or damages for their detention or conversion, or alternatively the sum of £297 as money paid for a consideration that had failed. Mr. Justice Bigham, in giving judgment, after referring to the conditions of sale, said that the four lots purchased by the plaintiffs consisted of iron girders and columns in the basement of the stores. There were four stores in the building, and each had a basement in which were iron columns and girders supporting a brick archway, above which was a layer of concrete, and on the concrete was a granite floor, which formed the floor of what might be called the ground floor of the stores. It was clearly the duty of the plaintiffs to remove the columns and girders, and to do what was necessary to detach them from the soil and from the superincumbent arches and cement. The other lots which the plaintiffs had bought were above ground and easy to remove and dispose of. These had been removed. The question was, Whose fault was it that the columns and girders had been left? It was not the defendants' fault, or, as had been suggested, the fault of the purchaser of the brickwork. It was wholly the fault of the plaintiffs themselves. Repeated complaints had been made of the delay; in the first instance the only excuse made by the plaintiffs was the difficulty which they had in moving their other lots. Later on it was suggested that the delay was due to the fact that the cement on the top of the brickwork of the arches was covered by so much brick rubbish that it was impossible for the plaintiffs to get at the columns and girders without incurring considerable expense, which, it was said, ought not to be incurred on their account. This was, in his Lordship's view, a mere excuse, put forward, not because the plaintiffs could not, but because they did not want to, remove the girders and columns. There had been no detention or conversion by the defendants nor had there been a total failure of consideration, and judgment would be entered for the defendants; but his Lordship said that he hoped that if the plaintiffs desired it they would be permitted by the County Council or the defendants, so far as they had anything to do with it, to enter on the site and remove their goods. Judgment for the defendants with costs.

WHITECHAPEL ART GALLERY.

THE new Art Gallery at Whitechapel was formally opened by Lord Rosebery last week. It has been erected at a cost of about £16,000, including the site, building and furnishing, the chief contributors to the building fund being Mr. Passmore Edwards, Mr. Yarrow, Lord Iveagh and Mr. Edgar Speyer. Mr. C. Harrison Townsend, F.R.I.B.A., was the architect.

The material used is the softly-tinted terracotta of which the Bishopsgate Institute was built, and which was described by the late Sir Edward Burne-Jones as "most beautiful." It was supplied by Messrs. Gibbs and Canning, Limited, of Tamworth. The architect, as an advocate of the wider use of colour in London street frontages, has, as at the Horniman Museum, made a prominent feature of the introduction of a large mosaic panel, suggestive of the objects of the building. It will be 25ft. long by 13ft. high, and will be recessed between the two turrets so as to allow a pent roof to protect it from the beating weather. This panel has not yet been executed, but a beautiful design for it has been prepared by Mr. Walter Crane. The subject of the design is "The Sphere and Message of Art."

Two galleries are provided, one on the ground floor and one on the first floor, sufficient to accommodate about 500 pictures. The ground floor consists of a hall as it were with nave and aisles, the latter being roofed with glass. It is 17ft. high, 100ft. long and 48 ft. wide. The upper hall is 18ft. high, 100ft. long and 26ft. wide, and is top-lighted. Besides these there is an annexe on the ground floor. The walls are covered by a rough crimson canvas over which are fixed the wood strips for supporting the pictures. The circulation necessary to a great picture gallery has been borne in mind throughout the building, and double staircases are provided for ingoing and outgoing visitors respectively. The gallery is heated by Grundy's system, and lighted throughout by electric light. The chief contractors were Messrs. J. Outhwaite and Son, of 34 Upper East Smithfield, Tower Hill, E.C.

It is proposed to hold four or five exhibitions in the gallery each year, some of pictures, others of various crafts and different periods of art. The control of the gallery is vested in a body of trustees, of whom Canon Barnett, of Toynbee Hall, is chairman. The endowment of £500 a year does not do more than cover the expenses of the staff and the lighting and heating of the building.

It is not proposed to attempt to make a permanent collection of pictures, as it is improbable that a really first-rate collection could be gathered together, and it is thought that the interest in the gallery among the people of the East End will be better maintained by short loan exhibitions of objects of real excellence. An attempt will be made to explain these collections to visitors by means of lectures, and the organising of "guides" to take small parties round the gallery. It is also proposed to organise a lending collection of framed reproductions of pictures on the lines of a lending library. The director will be pleased to receive contributions for these collections. The present exhibition of pictures will remain open for five weeks, and will then be succeeded, about Whitsuntide, by an exhibition of Chinese art. The loan of any objects of Chinese art for the coming exhibition will be welcomed by the committee.

Engineering Notes.

A new Bridge at Kildonan has just been completed by the Arran District Committee of the Buteshire County Council. It is of steel and concrete.

American Steel Combine: A Counter Move.—Messrs. William Jessop and Sons, of Sheffield, contemplate establishing works for certain branches of their business in the United States.

The new Infectious Diseases Hospital at East Boldon, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Distington Parish Church is being fitted with "small tube" hot-water heating apparatus by Messrs. John King, Limited, engineers, of Liverpool, who employ their improved economical coil heater with waterway firebars.

Tender for Widening Byker Bridge, Newcastle.—At a meeting of the sub-committee of the Town Improvement Committee of Newcastle Corporation last Wednesday, a tender was accepted for the widening of Byker Bridge. The contract will in all probability be completed within six months.

British Engineering.—In proposing the toast of "British Engineering" at the sixteenth anniversary dinner of the Institution of Junior Engineers, held on Saturday last, Sir Walter Peace, Agent-General for Natal, said there was some doubt as to whether British engineers were keeping abreast of the times. Ten years ago they had a practical monopoly of iron and steel markets in the Colonies, but that was now passing away. In his opinion it was most necessary to standardise the various qualities of iron and steel. The chairman (Professor J. Perry), in responding, said that standards were going to be arranged by the National Physical Laboratory.

Hampstead "Tube" Railway: Council Successful.—The whole of the objections raised by the Hampstead Borough Council in regard to the proposed Charing Cross, Euston and Hampstead Railway have been met by the promotors, who have agreed to insert the required provisions in the Bill. Among these is one prohibiting the company from generating or supplying electricity within the borough; another prohibiting the company from erecting a station anywhere in the borough north of the station in Heath Street already sanctioned; and another making it compulsory for the company to first submit the elevations of the proposed stations in the borough to the Council for their approval.

Electric Railways.—In the first of a series of three Cantor lectures on "Electric Railways" given at the Society of Arts, Major Philip Cardew, R.E., electrical adviser to the Board of Trade, pointed out that for short distances electricity had no rival, but the saving of time on long journeys was, perhaps, not yet possible. Already they heard of electric trains going 100 miles an hour, and no doubt that was practicable with proper construction and equipment of rolling stock. What appeared to be doubtful was not whether a speed of 120 miles an hour could be accomplished, but whether it would pay to provide such a service within the limits of the British Isles. A Midland Railway expert had calculated the cost of electric traction at 8d. per train mile, as compared with 9d., the present cost of steam traction.

Gas Engineering as a Profession.—In the course of an address before the Southern District Association of Gas Engineers and Managers last Thursday, Mr. Corbet W. Woodall, the well-known gas engineer, called attention to the inadequate supply of the right kind of aspirants for gas engineering appointments. One explanation which had been offered for this unsatisfactory state of things was the alleged poverty of the prospect offered by gas engineering to young men of talent. This imputation upon the profession he could most emphatically repudiate. Neither was it true that gas was a dying industry. Leaving these professional matters, he referred to the use of gas for public lighting, and made the statement that London, which saw the first gas company started nearly a hundred years ago, was at this hour the worst-lit capital city in Europe.

Comparative Costs of Overhead and Conduit Systems of Electric Traction.—In the course of a lecture delivered last Friday before the Institution of Mechanical Engineers on "Combined Trolley and Conduit Tramway Systems" Mr. A. N. Connett said that the question of the cost of conduits must be treated in a general way, local circumstances being such a large factor in the determination of cost that no other method is possible. The side-slot conduit can be built for about £500 less per mile of single track than the centre-slot. It is generally stated that a conduit road costs twice as much as an overhead-trolley road. This statement may be misleading, owing to the fact that an overhead-trolley road may be very variable in its cost, depending upon pavement requirements, overhead construction adopted, and many other local conditions, such as the regulations for the return current by the rails. But the construction of the conduit part of a road is quite independent of these factors—that is, for an overhead-trolley road which would cost £5,000 per mile of single track; it is quite probable that the same road with the conduit construction would cost £11,000 for the same length. If the overhead-trolley line should have a first cost of £10,000 per mile of single track there is no reason why the use of a conduit on such a line would double the cost as in the first instance. Roughly speaking, the cost of a conduit in this latter case would be £16 000. A conduit road will cost from £5,000 to £5,500 more per mile of single track than a trolley road under the same conditions, to which should be added the increased cost of special track work and the removal of underground obstacles. Under ordinary conditions the difference in cost will vary between the limits of £7,000 and £9,000.

Acetylene Gas.—This was the subject of a paper read by Mr. Isaac Low, jun., before the Glasgow Architectural Society on March 11th. The production of acetylene gas by the action of water on carbide of calcium, he stated, was first discovered by Edmund Davy, a Dublin professor of chemistry, in 1836, and communicated by him in that year to the British Association, but the difficulty in manufacturing the carbide prevented the process getting beyond the stage of a laboratory experiment at that time. After the invention by Siemens of the electric furnace, carbide was accidentally produced by the action of its intense heat on the lime and carbon which were found to be the most suitable materials for the lining of the furnace, and in 1892 an American chemist also rediscovered carbide in the course of experiments with the metal calcium. It did not, however, become a commercial product till the year 1895. The light produced by acetylene is twelve times as brilliant as that produced by a similar quantity of coal gas, and the cost at the present market price of carbide is equal to that of coal gas costing 4s. 7½d. per 1,000 cubic feet. A description was given of the three main types of apparatus used for the production of the gas—those in which water is dropped on to carbide, those in which water is allowed to rise round carbide, and those in which carbide is dropped into water, preference being given to the last, owing to the smaller amount of heat generated and the greater purity of the gas. Acetylene is more largely used as an illuminant in Germany than in this country. Owing to the richness of the gas special burners are needed. The gas is non-poisonous and in burning it vitiates the air less than coal gas. On account of its characteristic odour, escapes can be easily located.—At the same meeting the office-bearers for the year were elected—Mr. James Chalmers, I.A., being appointed president; Mr. Ninian Macwhannell, I.A., and Mr. John L. Duncan vice-presidents; Mr. Alexander Gardner, 209 St. Vincent Street, hon. secretary; and Mr. William Howatt, I.M., 146 Buchanan Street, hon. treasurer.

Correspondence.

Bricklayer's Bond.

To the Editor of The Builders' Journal.

Walton-on-Thames.

Sir,—There is sometimes an uncertainty in the mind of an architect as to the bonding of bricks. Your issue for March 6th contains illustrations by an architect showing how he would arrange his bricks in building a chimney stack, &c. I do not think that any bricklayer would take kindly to the method shown. No doubt many of your younger readers would prefer to be guided by an architect in such matters, but perhaps they would not object to be shown how the same work would be set out by a practical bricklayer. The writer of the article in question explains that angle fireplaces contain an enormous quantity of cutting. His drawings clearly show this, but the practical bricklayer would avoid unnecessary cutting and arrange his bricks so as to get strength in bonding; he would also be careful to show on the face of the work that it was so bonded—this cannot be done by the method used in the drawings referred to. Outside the roof it is usual to carry up the stacks in very hard red bricks, or very hard stocks, so that the less cutting the better.

In the accompanying drawings I have made use of the same angle fireplaces shown on page 85 of your issue for March 6th, but with the flue as it would most probably be in the work, and the bond as worked by a bricklayer. The position of the flue mentioned might, perhaps, be parallel with the plain side of the wall. The alternate courses are shown and all the cutting proper, namely, bird's-mouth bricks, which would be cut down below (see Fig. 1).

Figs. 2 and 3 represent alternate courses in the same chimney stacks (like those in the article), bonding properly and showing on the face that strength has been considered. Fig. 4 shows how a chimney stack with the flues at an angle outside the roof would be built. Fig. 5 gives alternate courses of a 14in. wall, old English bond, as generally worked, that is, with quarter (header) bond in the angle. Fig. 6 gives alternate courses of the same wall worked as shown in the illustrations referred to, which by some would be objected to on account of their being bonded in by the stretcher. Fig. 7 shows alternate courses of 14in. wall, Flemish bond. This would, in some instances, be tied in the angle with two headers instead of the stretcher, as shown, and in other cases the small pieces would be omitted. Fig. 8 gives alternate courses of the same wall built so as to be more readily filled in with "bats," of which there is generally no lack. Of the two arrangements of "Flemish bond," Fig 8 is the most convenient, for various reasons.

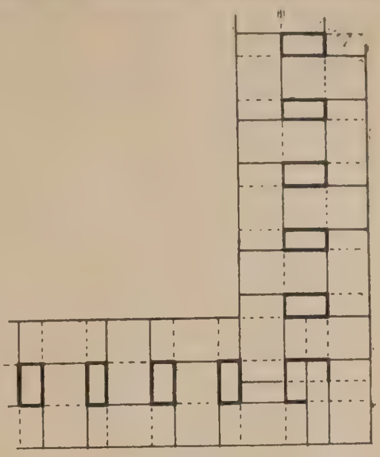
The flues shown are supposed to be properly pargetted. When flue-pipes are used the adjacent bricks are cut away, but this should not affect the bond.

There is one thing often lost sight of by architects, the omission of which entails more expensive cutting than is caused by angle fireplaces. Plans showing the openings are frequently figured in, giving the exact width of openings quite regardless of the length and nature of a brick. The adjoining brickwork has then to be arranged to suit, when possibly the openings might have been shown very slightly wider or narrower, so as to exactly suit the bricks.—Yours truly, R. RAMM.

To the Editor of The Builders' Journal.

Southampton.

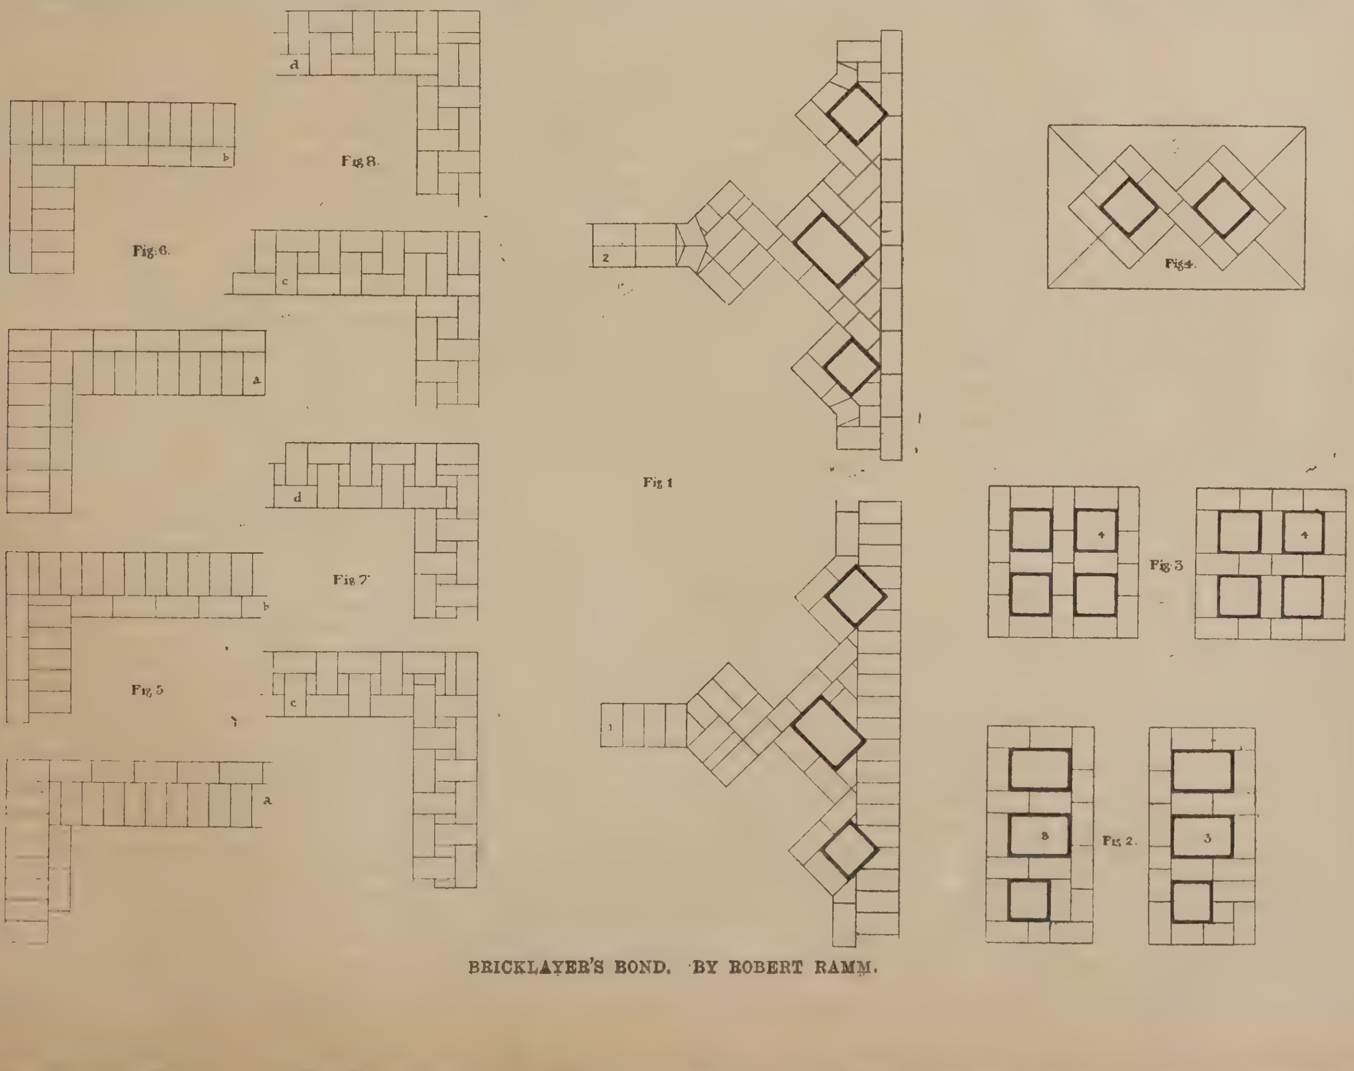
Sir,—I have read Mr. Robert Ramm's letter with the greatest interest, for we are more in accord than he seems to think. He begins by criticising the angle fireplace, saying that "the practical bricklayer would avoid unnecessary cutting." In his own suggestion for bonding this work he shows 6ft. 8in. cutting in one course and 4ft. 4in. in the next, giving an average of 5ft. 6in. per course, which is, as I have said in my article, "more than 5ft. run of splayed cutting in each course." I confess I am unable to understand his meaning in the latter part of his first paragraph, for my bond (English) most distinctly shows on the outside and has only one straight joint of about 3in., while my critic shows twelve of them with a total of 4ft. 10in. run. There is some remarkable cutting in his bird's-mouths, and how many bricklayers could be trusted to cut these puzzle blocks so as in any way to preserve the bond? I fear they would be superseded by odd scraps of rubbish called euphoniously "'bats,' of which there is generally no lack."



BRICKLAYER'S BOND.
BY ROBERT W. CARDEN, A.R.I.B.A.

In regard to Mr. Ramm's second point (chimneys), it certainly appears at first sight that he avoids some of the cutting, but I contend that there is almost as much cutting in a *properly* cut three-quarter bat as in a splay. Now in Fig. 3 he shows six of these bats in each course, which seems to me to entail at least as much cutting as my four splayed cuts. Fig. 2 is unfortunate in having three straight joints in the same angle.

Figs. 4, 5, 6, 7 and 8 do not refer to my article, but are perhaps added for my enlightenment. Flemish bond, as everyone knows, is inherently weak in thin walls, but my critic has gone out of his way to weaken it in Fig. 7. I send a sketch of two courses superimposed, the straight joints denoted by thick lines: this works out to about 2ft. run of straight joint in each course per foot run of walling, that is to say, the spaces enclosed by thick lines are valueless, for a closer is hardly ever the neat little cubical block of brick that it



BRICKLAYER'S BOND. BY ROBERT RAMM.

appears on a drawing, but is usually a stray chip or splinter.

But perhaps my best answer to Mr. Ramm would be this—my article dealt with what a bricklayer *should* do and not with what he *would* do.—Yours truly,

ROBERT W. CARDEN, A.R.I.B.A.

The "Notyngham Porch," St. Mary's Church, Bury St. Edmunds.

To the Editor of The Builders' Journal.

London.

Sir,—When revising my letter on page 88 of your isssue for March 6th, you left out a rather important item, namely, the first part of the above title. The ceiling mentioned is that of the porch, not that of the church. I fear this will be rather misleading to your readers, as the breadth of the nave and aisles is nearly 70ft., the former being spanned by one of the finest hammer-beam roofs we possess.

Yours truly,
R. H. MAYHEW, A.R.I.B.A.

[We regret the error to which our correspondent draws attention : his former letter was not, however, quite explicit on this point.—Ed. B. J.]

Study of Gothic Work.

To the Editor of The Builders' Journal.

Eccles.

Sir,—Referring to the enquiry on page 105 of your issue for last week, "Edinburgh Student" will find all he wants in the "Churches of the Nene Valley," a work edited by Edmund Sharpe, of Lancaster, and comprising measured drawings and sketches by about half-a-dozen ardent students, including

Yours truly,
WALTER K. BOOTH.

War Department Building Prices.

To the Editor of The Builders' Journal.

Sir,—In reference to the reply on page 104 of your issue for last week with regard to the War Department building prices, "Student" had better apply to the District Paymaster, Army Pay Office, Pembroke Dock. By the regulations for engineer services of the army, "private architects and others" may (unless there are strong reasons to the contrary) "be furnished with printed copies of the schedule of prices on paying for the same at the rate of 3d. per page." The present price of the whole schedule is 15s., plus postage. The paragraphs of the "Regulations for Engineer Services, 1900," which govern the sale of schedules, are 562 and 563. "Student" might quote these to the Paymaster when writing.—Yours truly,

WAR DEPARTMENT SURVEYOR.

Wages Due from Bankrupt Employers.

To the Editor of The Builders' Journal.

Sir,—With reference to the enquiry on page 104 of last week's issue, I would express the opinion, with all due deference to "G.A.T.M.," that "Constant Reader" will find wages or salary are paid in priority only for services rendered during four months previous to the bankruptcy, and up to £50. My reason for writing to you is to correct the too general impression that wages are preferential debts under all circumstances. I know of a case of an assistant who recently lost a year's earnings through the bankruptcy of his employer, a well-known London architect.—Yours truly,

A. B.

Large Improvements to Calais.—The Calais Council propose to build a new Town Hall and a municipal theatre, and to lay out several boulevards on the extensive tract of vacant land near the town station between North and South Calais (formerly Calais and St. Pierre). The proposed improvement will much enhance the town and provide good class residential accommodation. The resale of the land as building frontage will provide the greater part of the cost of carrying out this important scheme.

Builders' Notes.

Mr. Evan Williams, a leading Bangor builder, died last week.

London County Council.—At last week's meeting of the Council Mr. McKinnon Wood moved: "That, in view of the decisive verdict of the electors of London in favour of the Council's water policy, a deputation be appointed to urge upon the President of the Local Government Board that the Government should allow the Council's Purchase Bill to pass second reading and to be referred to a committee of Parliament." He pointed out that the people were determined to wait no longer for the settlement of this question, and that they desired to have control of the water supply. It was idle to talk about newfangled schemes of water boards and trusts, for none of them would satisfy London. After considerable discussion the resolution was adopted.

Co-operative Carpentery and Joinery Workshops.—A branch of the Carpenters' and Joiners' Society in Hull, two years ago, owing to a strike which had lasted for eight months, formed a works department, which started business on a small scale. In open competition an important contract was secured, on which a handsome profit was made, and at the end of ten months the enterprise had yielded a profit of 21 per cent. The Hull men are confident that in due time they will absorb a large share of the local building operations. Numerous appeals have been made to the general council of the society to take action on the lines of the Hull branch, and 67 branches have passed resolutions in favour of such action. Amongst the proposals which apparently find most acceptance is one that during the four weeks of June next each of the 62,000 members of the society shall be asked to pay a levy of 6d. per week for the establishment of the "Amalgamated Society of Co-operative Joiners, Builders and Contractors in various large centres of industry in the kingdom." This levy would produce a sum of £6,200 for the establishing of business ventures in 18 industrial centres. According to this scheme, the five managers or committee men in each branch are to receive, in addition to joiners' wages for all time spent in business matters, a share of 16 per cent. of the profits; 40 per cent. of the profits are to form the nucleus of a fund for establishing similar concerns in other towns.

Salford Building By-laws.—The Salford Town Council recently considered the recommendation of the Building and Bridges Committee to the effect that application should be made to the Local Government Board to amend building By-law 13 (Sub-section C) so as to read as follows:—"If the wall does not exceed 35ft. in length it shall be 13½in. thick below the topmost two storeys, and 9in. thick for the rest of its height." Communications were read from the Manchester and Salford Independent Labour Party and the Independent Labour Party of the South Salford district protesting against the proposed alteration of the by-law, on the ground that it would have the effect of lowering the present standard and giving additional facilities to the jerry-builder. Happily the recommendation was passed. The action of the labour party is a most mischievous one, and if carried out by other bodies in districts in which the political power is in workmen's hands, will entail needless hardships. The plea that 9-in. walls for two storeys are against the principles of good building is a ridiculous one. The action was, presumably, really taken on the supposition that thinner walls would reduce the amount of labour required in the district. This is a fallacy, for if such wasteful methods were carried out they would increase the cost of building materially, resulting in speculative builders and building-owners being less inclined to build and causing increased rents, as is evidenced by the present depression in the building trades. The housing problem is made more complex by the irksome restrictions of the by-laws. Jerry-building could be guarded against without laying down rigid laws as to thickness of walls, &c., which would be unnecessarily thick with good construction.

New Patents.

These patents are open to opposition until April 20th.

1900.—Fireproof Floors.—2,739. A. W. Green, The Glen, 35 Gorst Road, Wandsworth Common, S.W. The floor consists of an arch of fireproof material stretching from girder to girder and a series of slabs which are held against the lower flanges of the girders by clips. These slabs have raised distance-pieces on their upper surface, so that an air-space is provided between them and the girders. Dovetail grooves are formed on the underside of the slabs in order to provide a key for the plaster ceiling.

Stoves.—2,759. W. Youlten, 159 Victoria Street, Westminster, S.W. A twin or triple grate is adapted to burn gas, coal or other fuel, as may be found most desirable. One grate has a suitable gas supply, and the other is constructed to burn coal, wood or other fuel, and the register is so arranged as to cut off communication between the flue and the grate which is not in use. According to the second part of the invention, a gas stove may be used in an existing coal grate, preferably by sinking it flush with the top surface of the hearth, being lifted into position when required.

Circular-Saw Benches.—5,670. N. Tailby, 76 Summer Row, Birmingham. In saw benches for cutting and ripping deals and battens a difficulty is often experienced in the automatic feeding of short lengths to the saw, owing to the spring of the material immediately on passing clear of the feed rolls. To avoid this, a guide and pressure attachment is provided between the rolls and the saw.

The following specifications were published on Saturday last, and are open to opposition until April 27th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—1,133, Boult (*Sauvalle*), incandescent electric lamps. 3 284, Farmer, gas burners. 3,317, Hall, guides for augers. 3,886, Heaphy, fire alarm thermostats. 4,006, Marsden, Lewis bolts. 4,053, Orme, means for manipulating doors, &c. 4,355, Challis, artificial stone. 4 803, Fessenden, electric incandescent lamps. 5 137, Gale, incandescent electric lamps. 5,149, Lambert, road macadam scarifiers. 5,285, James, girders for the construction of bridges, &c. 6,251, Johnson (*Schild and Lorey*), tie bars. 6,325, Etchells, doors for hoists. 6,629, Riley, filtering apparatus. 6 891, Sharp, smoke-consuming firegrates. 7,184, Messinesi, dovetailing. 7,285, Parsons, Belfield and Chapman, electric railways on the conduit system. 7,618, Kollinger, pipe or hose coupling. 7,737, Tribelhorn, arc lamps. 11,222, Ravenor, apparatus for testing drains. 11,560, Wurts and Hanks, electric incandescent lamps. 15,024, Dymond (*Lochman*), wood-carving machines. 17,729, Cook, door stop for protecting skirting boards, &c. 18,621, Holŭb and Dvorádek, apparatus for producing acetylene gas without gasometer. 20,732, Robinson, construction of staircases. 21,997, Lacroix, atmospheric gas burners. 22,941, Doyle, artificial stone. 23,013, Hartmann, band saws for sawing metal. 23,880, Gary, elevators.

1901.—221, Hausmann, sliding and swinging window sashes. 419, Heuer, heating stoves. 910, Dymond (*Schratwieser*), laths for plaster walls, &c. 1,190, Gopffarth, vices. 1,258, Cochrane, cowls for chimneys. 1.316, Shaber (*Sharer*), pipe joints. 1,460, Peter, wooden pulleys. 1,471, Bogia, electric arc lamps. 1,559, Denton, flush tanks for water closets.

Notice to Advertisers.—The new series of The Builders' Journal, which will commence with the issue of April 3rd, referred to on page 109, will offer special advantages to advertisers, who should apply for space as early as possible.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Art is the perfection of Nature.
SIR THOMAS BROWNE.

Our Plates. ST. GILLES' CHURCH, Provence, France, was begun by Alphonse Jordain, of Toulouse, early in the twelfth century, but owing to the troublesome times with which it was connected it was in all probability never completed. The famous portal, with its wonderful carvings, is cleverly represented in Mr. Mallows's drawing.—Our illustration of the public library at Ausburg, Bavaria, is taken from the "Architektonische Rundschau." M. Dülfer, of Munich, is the architect. The building contains 200,000 volumes of considerable value. The drawing of Mr. Mountford's administrative block at the new Sheffield Infirmary was exhibited at last year's Academy.

Roman Masonry. AT the London Institution recently a paper by Mr. John Terry, the City Clerk of Works, on a portion of the Roman wall unearthed in Old Bailey, near the Sessions House, was read before the members of the London and Middlesex Archæological Society. The discovery was made at a depth of 18in. below the pavement level, and 99ft. from the centre of the carriageway. The specimen of masonry in which so much interest is centred is 8ft. high and 8ft. 3in. thick above the foundation. Commencing from the base of the foundation, which is of ballast, there are revealed 3ft. 6in. of rubble work, then three courses of tiles, sesqui pedales, and above these 2ft. 7in. of ragstone. Then come two courses of tiles, followed by more rubble work. The interior of the wall is of ragstone, roughly tumbled in and grouted with lime mortar of an excellent description. The whole forms a hard concrete mass. The inner face of the wall is in a good state of preservation, but the outer face shows to a marked extent the action of the water of the mediæval ditch. The mortar analysed by Mr. N. F. Hills is declared to be chemically and physically excellent, the proportion of lime to sand by volume being about one to two.

Venice and the Mainland. A LADY writes to the "Times" with regard to the proposal made by a certain influential commercial class of Venetians for erecting bridges to connect Venice in different directions with the mainland. Already three different plans, with varying estimates, have been prepared and presented to the municipal authorities for acceptance. Says this lady: "Can nothing be done to check this appalling scheme, justly named by the 'Tribuna' 'disegno bestiale'? Is Venice, world-famed Venice—the Venice of poetry, the Venice of history, the Venice of our dreams realised or unrealised—to be allowed to be destroyed for the sake of commercial advantage and gain to a few? Surely, if anyone with influential name would start a petition against such wanton destruction of one of the loveliest places in the world, all who have ever been, or ever hope to be, in Venice would gladly sign it, and those Venetians (unworthy of the traditions of their great city) might be brought to see that their immediate pecuniary loss by the absenting themselves of the customary visitors who pour in to see ancient Venice might exceed the desired prospective gain of iron-bridged modern Venice."

A Unique Exhibition at Darmstadt. THE young Grand Duke Ernst Ludwig of Hesse, grandson of Queen Victoria and son of Princess Alice, has recently called into existence a colony of artists at Darmstadt. The members consist of architects, sculptors and painters, invited from all parts of Germany and Austria, and include the well-known architect, Professor F. W. Olbrich, of Vienna; Professor Hans Christiansen, of Schleswig-Holstein; Professor Peter Behrens, of Hamburg; and Ludwig Habich, the sculptor of the monument to the Princess Alice now in course of erection at Darmstadt. In founding this artists' colony, the Grand Duke has had chiefly in view the development of art in the direction of technical education and of industry. He considers, rightly, that the more Berlin becomes the political and social centre of Germany, attracting the pick of the younger and more ambitious artists, so much the more it becomes the duty of the rulers of the smaller German states to foster the development of art in their own domains, and that duty is best fulfilled by bringing beauty into the homes of the people. The little colony intends to open on May 1st next an exhibition for which it claims originality of conception and thoroughness in execution. It will consist of a central building, named after the Grand Duke the Ernst Ludwig House, broad and symmetrical in design, built after the plans of F. W. Olbrich, and containing the common ateliers, assembly-rooms and so on of the Colony. The rest of the exhibition—and this is its novel feature—will consist of the dwelling-houses of the various members. The designs of the houses themselves, as well as of every piece of furniture or utensil they contain, have been elaborated with the most artistic care, and the work has been executed in the best and most modern style. The exhibition will remain open till the end of October.

The Castle Garth, Newcastle-on-Tyne. THIS picturesque old thoroughfare, situated within the precincts of the castle, is now nearly all pulled down to make way for modern improvements. At one end stands the Black Gate, a gloomy thirteenth-century gateway with a seventeenth-century tower as superstructure. At the other end is the fine Norman keep of the fortress. Both are happily in the occupation of the Newcastle Society of Antiquaries. (Neither is shown by Mr. Fred. W. Morgan in the sketch reproduced on this page, but the graceful perpendicular steeple of the cathedral church of St. Nicholas rises over the house-tops, pictorially, just where it is needed). The street, at one time a busy place, but now deserted, has a peculiar history. In 1619 one Alexander Stephenson obtained a lease of this quarter, by which its occupants enjoyed certain valuable rights and privileges, making them independent of the trade guilds and of civic jurisdiction; being in the heart of the town it became a thriving trade resort, and continued so for 200 years or more. Newcastle has altered considerably of late, and its old buildings are rapidly disappearing. Some might well have been preserved; others, after all, are better swept away. In any case most of them have so much of that quiet artistic treatment in their general outline and detail, so much that is worth perpetuating, that it is not without a pang one sees them disappear and give place to pretentious structures, too often remarkable only for their size and vulgar ornament.

The Castle Garth
Newcastle on Tyne

The Memorial to Queen Victoria. MR. J. OLDRID SCOTT, F.R.I.B.A., writing to the "Times," says: "The suggestions are limited to these—a chapel, to be erected in the near neighbourhood of the Abbey, and an architectural structure with a statue of the great Queen as its culminating feature, to be built either in the gardens to the south of the House of Lords or at some point in the Mall. The first proposal is a utilitarian one, as the chapel would become the place of interment for eminent persons for which no more space is to be found within the walls of the Abbey itself. Designs for a building of this nature were prepared by the late Sir Gilbert Scott and also by Mr. Pearson. The decision come to, however, by the Memorial Committee seems to be adverse to a structure of this kind, and, if so, the question is narrowed to the selection of a site for an architectural composition more or less on the lines of the Albert Memorial, though not of necessity in the same style. My object in writing is to point out a serious, if not fatal, objection to the site which has been suggested to the south of the Victoria Tower. It is this, that that tower is on so vast a scale that it would inevitably dwarf any memorial built in its immediate neighbourhood. A minor objection to this site is that it is so seldom seen by Londoners, as the road passing it leads to nowhere in particular. On the other hand, it seems to me that a very excellent position might be found in connection with the Mall, provided that it was not too near to Carlton Terrace, where the great height of the houses would prevent a good effect being obtained."

Mr. Long and the Housing Problem. MR. WALTER LONG, the president of the Local Government Board, in a letter to the secretary of the National Housing Reform Council, says:—"That in view of the emphatic decision on the question of an extension of the period for repayment of loans which was arrived at in Parliament so recently as last year, he does not think he can hold out hopes that the matter is ripe for reconsideration by the Local Government Board. As regards the model by-laws, he is deeply impressed with the vast importance of throwing no unnecessary impediment in the way of those local authorities who are endeavouring to deal with the question of the housing of the working classes, and he is therefore at the present time engaged in very careful consideration of the by-laws of the Board, in order to ascertain whether alteration in any direction appears desirable, and, if so, whether such alteration could be made without any unwise relaxation of those standards which are considered essential for the public welfare."

Casting a Statue of Gordon. A WEEK ago the replica of the Chatham statue of Gordon by Mr. E. Onslow Ford, R.A., subscribed for by readers of the "Morning Post" and to stand in front of the college at Khartoum, was cast at Parlenti's Albion Foundry, Parson's Green, by Major-General Sir Andrew Clarke. The statue represents Gordon seated on a camel, and needed to be cast in several pieces. Within the foundry was the original model of the statue, which was presented by Mr. Onslow Ford to the Crystal Palace. Hard by was the furnace, and at the back of it was a pile of bronze ingots, which were put in one by one by an Italian workman. By the time all was ready for the casting the furnace held 3 tons of the molten metal. In front of the furnace one saw an oval bed of clay, from which a gutter led up to the hole from which the metal would presently issue. It stood over the centre of a great pit, and beneath it was a cubical mass confined by battens. Within that mass was the mould of the body of the camel, with the saddle and the plinth. The casting of a statue is an interesting operation. It is first of all modelled in clay, and from this model a hollow cast is made in wax. This model is touched up, and is then filled with a particular kind of sand. It is also surrounded with the same material, which is tightly packed, and which, under the action of heat, turns to a kind of clay. Then a fire is lighted underneath, and the wax is gradually burned away. In the end the sand which filled the cast is divided from that which surrounded it by the thickness of the wax. It is into this space that the metal flows at the moment of casting.

Fools who Build. Referring to Mr. Blashill's lecture on the present condition of the building industry, a report of which was published in our last issue, the "Liverpool Post" says:—"There is an ancient saying to the effect that fools build houses for wise men to live in. This apophthegm was evolved, no doubt, from the frequency with which in all ages the amateur dabbler in bricks and mortar has come to grief, for the professional builder, as a rule, is sufficiently skilled in the economising of labour and material to emerge at the big end of the horn on the conclusion of an enterprise, whether speculative or under contract. There are few men who have made their fortunes in business who remain unsmitten towards the evening of their days by the desire to build a house entirely according to their own notions, in which they may enjoy their *otium cum dignitate*. The fruition of this idea is generally the builder's golden harvest and the beginning of trouble for his employer. Often must the latter imagine that the whole race of constructive artisans—bricklayers, masons, carpenters, plumbers, and range-fitters—have entered into a conspiracy against his pocket and his peace of mind."

Sculpture at the Glasgow Exhibition. We learn from the "Morning Post" that the arrangement of the sculpture at the Glasgow Exhibition is in the hands of Mr. E. Onslow Ford, R.A., and Mr. George Frampton, A.R.A., who have devised a most ingenious method of lightening their labours. They have had a plan of the hall drawn to scale. They are in the happy position of knowing exactly what will be exhibited, and they have already given to each piece of statuary that is to be shown a numbered position. When the statues are sent in each will bear its allotted number and will be taken direct to its place, and if in any case a rearrangement seems necessary, it will be easily effected at the end. Those who visited the Paris Exhibition cannot have failed to be greatly struck by the sculpture shown, and especially by the way in which the British sculptors vindicated themselves, while their brothers who work in paint were brought into something like derision because their works were arranged and displayed with just about as much eye for effect as is to be observed in the stamp-album of "the human boy." It seems likely that at Glasgow, also, the art of the sculptor will be worthily represented. Among those who will exhibit are Messrs. Lucchesi, Fehr, Pegram, Thornycroft, Pomeroy, Taubman, Kellock Brown, M'Gill, Keller, Frampton, Onslow Ford, Walker, Tweed, Wood, Colton, P. Montford, Stirling Lee, Brock, Gilbert, J. M. Swan, Tenner, Dressler, Furse, Cecil Brown, Starke, Rhinde, Hodge, D. W. Stevenson, W. G. Stevenson, Drury, Sheriff, Webster, Shannon and C. Allen. The Countess Gleichen and Miss Giles will also exhibit. Mr. Onslow Ford is at present an extremely busy man. During the months of March and April he is teaching at the Royal Academy schools. At the end of April he will have to superintend the erection of his statue of Queen Victoria at Manchester. He is not yet at the end of his labours in connection with certain works which will be seen, if all goes well, at the summer show of the Royal Academy; and he will of course need to visit Glasgow before the exhibition is actually opened.

ORIGIN OF THE CHESTER ROWS.

Under the auspices of the Chester and North Wales Archæological and Historic Society a lecture was recently given by Mr. H. D. Harrod, F.S.A., on the origin of the Chester "Rows." The generally-received explanation of the Rows in former times was that the original ground-level of the city was the same level with the Rows, and that the streets were cut out from this level 16ft. to 20ft. down into the solid rock. Researches had clearly proved, however, that the roadway represented the original ground-level, and that the Rows were artificially raised above that level. The foundations of the Roman buildings corresponded with the height of the roadway, and the Rows themselves were raised above that level by the accumulations of centuries. After dealing with many of the theories extant, the lecturer went on to say that the four principal streets in which the Rows were situated were without doubt the four main streets of ancient Roman Chester. Roman remains amply proved that not only the lines but the actual breadth of the roadway was identical. As, of course, the Rows did not exist in Roman Chester, or indeed until centuries after it had disappeared, why should it happen that they were only to be found within that area? There must have been some feature of the Roman Chester which was the germ from which the Rows were subsequently evolved. The second point was that the construction of the houses over the Rows was comparatively modern. In the old prints many of the houses did not project, but had a sloping roof that covered the Row and afforded protection to foot passengers. Accommodation for living in the Middle Ages was meagre, and the covering-in of the pent-house front by enlarging the house to the roadway was a tendency of later times which had gradually been taken full advantage of. The third point of importance was the fact that the shops in the street were, and always had been, for the most part in different ownership to the shops and houses behind them. The cases in which the shops in front were in the same ownership as the shops behind were exceptional and could be easily accounted for. The name "selda" which was applied to these shops in the old deeds denoted a stall or shed. From the position of the remains that had been unearthed it was clear that the Roman buildings were built flush with the present line of the streets, with steps leading from the street to an ambulatory or covered way under the roof of the main building. They had then in Roman Chester the four principal streets of much the same width as at present, lined with stately buildings colonnaded, and with steps leading from the roadway. They could imagine then that in Roman Chester there existed the threefold ownership—first the proprietor of the house, then the shopkeeper, who held a shop between the private house and the ambulatory, and lastly the stall holder, who placed his stall on market days on the steps. In London to-day, by long usage, the costermongers claimed a prescriptive right to a position at the roadside. In the course of centuries the general height of the ground-level was raised considerably by the ruins of the old buildings and the waste and rubbish of ages. On the sites of the old houses were erected wooden structures for shops and dwelling-houses. These shops were merely stalls with a projecting roof, probably extending partially over the pathway, affording a shelter to the purchasers who stood outside on the footway and made their bargains with the shopkeeper through the open window. As trade revived the old influx set in on market days. The countrymen found the streets all too narrow for their purpose, and took their stand on the bank at the roadside. The shopkeeper of Roman times had his shop in the ambulatory; the countryman or journeyman sold his wares on the steps in front. The shopkeeper of Norman times built his wooden shops on the ruins of the old buildings, and before him on the bankside the huckster of his day sold his wares; just as in Roman times ample room would be left for access to the upper pathway between the temporary stalls on the bankside. Many, no doubt, erected for the day some booth or rough shed, such as were set up in the market on market days. In process of time these would be left in position. The origin of the Rows, then, must be sought for in ancient Chester. The shop of the ambulatory with its covered way was perpetuated in the shop in the Row. The stall for traders on the steps found its lineal descendants in the shop in the streets. The covering over the Row had given way before the growth of the houses to the front, economising space and affording better living accommodation. Without any great revolution in design or architecture, the Rows had developed by a natural growth on the lines of the ancient design of Roman Chester.

COVERINGS FOR FLAT ROOFS.

By ROBERT W. CARDEN, A.R.I.B.A.

Flat roofs are generally covered with lead, zinc, or copper, but of late years asphalt seems to have found much favour, especially in large towns, where almost the whole of the available ground area is built upon, as a means of supplying drying grounds for workmen's dwellings and buildings of that class. Where this is the case the construction usually employed does not differ greatly from that of an ordinary fireproof floor, except that it is covered with a layer of asphalt and laid to fall to gutters. Only the natural asphalt should be used, as the artificial kinds are apt to be affected by the rays of the sun in summer and generally become soft during at least four months of the year.

The methods of laying lead, zinc and copper upon flat roofs are similar in main points, for each metal is liable to contraction and expansion with the variations of temperature, and in each case "free ends" have to be allowed to prevent cracks and other damage. Each should be laid upon grooved and tongued boarding running in the direction of the fall, cross battens being laid upon the joists where necessary (as shown in the accompanying illustrations). In each case, too, there should be a fall of at least $2\frac{1}{2}$in. in 10ft., and drips should be contrived longitudinally so as to break the metal sheets into strips about 7ft. or 8ft. long. The distance apart of the rolls will depend mainly upon the width of the sheets of metal used and will vary from 2ft. to 3ft., centre to centre. The shape of the rolls and method of forming them is the main point of difference between the three metals; it is shown drawn to one-half full size for purposes of comparison. The lead rolls are the most easily formed, but are coarser in appearance than the others. Copper rolls are the neatest and are fairly easily worked, but the metal is too expensive for common use. There is a little difficulty in the formation of satisfactory zinc rolls, for this material does not lend itself well to bending at sharp angles; so that instead of folding the capping-piece into the clip, two small holding slips have to be soldered to the sides of the capping (as shown), and the whole thing slipped up into its place until the holding slips are in the turn-down of the clip. As regards weight, lead is the heaviest, as it should not be less than 7lbs. per foot superficial, or about $\frac{1}{8}$in. thick. A sheet of copper of equal durability only weighs 1lb. per foot superficial, and zinc for the same purpose need not weigh more than $1\frac{1}{2}$lbs. per foot, though these latter, on account of their thinness, require to be laid upon roofing felt, otherwise they are liable to be cracked through the warping of the boarding underneath. Where drips are formed they should never be less than $2\frac{1}{2}$in. deep, and the angle blocked out with a fillet of wood so as to avoid sharp bends in the metal. The horizontal portion of the undercloak should be let into the woodwork so as to avoid a ridge where the overcloak covers it. Lead aprons and flashing need not weigh more than 5 lbs. per foot superficial, but those of zinc or copper should be of the same thickness as the sheets used for the general work. Where a flat roof abuts against a wall the metal should be turned up, and an apron wedged into the joints of the brickwork, and turned down over the top of the turned-up portion.

COVERINGS FOR FLAT ROOFS. BY ROBERT W. CARDEN, A.R.I.B.A.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Re-slating Roof in Exposed Position.

LLANDDAROF.—WELSHMAN writes: "My house is in a very exposed position, and during storms the slates are continually coming off. The present slates are 24in. by 12in. and I intend to remove them and cut them to 20in. by 12in. Which would be the best method of re-slating, as I want to make a secure job of it? Which is the best way to fix a single slate when it has become detached from the roof, without having to strip the roof to get at it?"

The cause of failure in your case may be one (or more than one) of several:—Can the wind get under the slates at the verges more than is unavoidable on account of the exposed position? Are the slates top nailed and therefore subject to undue leverage in a storm? Is the slope of the roof very steep, so that the slates more or less depend for security merely upon their hang on the nails? I have known cases where composition slate nails gradually crept out of a roof of steep Gothic pitch until, when the slate at last fell, the shank of the still perfectly sound nail was parallel to the head instead of at right angles to it. Are the nails perished? Is the roof of board or is it battened merely? Have the slates sufficient lap? I would suggest re-slating upon $\frac{7}{8}$-in. rough boards; slate battens may, if desired, be used on top of the boards, but it is not necessary, though such a method of construction tends to equalise the temperature inside the house. To also secure an equable temperature and to render the roof proof against driving snow, inodorous felt should be laid on the boards before slating. Close slate with small slates (cutting your 24in. by 12in. is not a bad idea) and centre nail each with two nails. Copper nails, though expensive, are most durable and are usually $1\frac{3}{4}$in. or 2in. long. Failing copper I prefer iron "wire" nails rather than composition ones. Lay the slates with a lap of not more than 3in., and provide proper tilting fillet along the eaves to keep the wind from entering at so vulnerable a point. The eaves and margins should all be double slated and the ridge should be a heavy one. It is always unsatisfactory to replace a single slate which has slipped out of place, but the best way is to secure it by copper strips about $\frac{3}{4}$in. wide and about 6in. long bent in such a way that, when nailed (through the slate below) on to the roof, the lower end will receive the tail of the slipped slate. Lead strips are often used for the purpose, but are liable to be affected by the heat of the sun, and if partly undoubled may be rendered useless by snow sliding down the roof. G. S. M.

Qualifications of Instructor in Architecture.

PAISLEY.—QUERIST writes: "What are the necessary qualifications for a teacher in architecture to be recognised by the Science and Art Department? Is it necessary that he should hold an Art Master's or Art Class Teacher's certificate, or is there a recognised qualification for architecture alone?"

There is no special qualification for architecture alone. Anyone holding an Art Class Teacher's certificate may teach it and all other subjects of the "art" side of the department; but it is necessary to possess the Art Master's certificate before becoming the headmaster of an art school. G. A. T. M.

Theoretical Mechanics.

HULL.—J. T. writes: "Is theoretical mechanics of much use to an architect? What subjects should I take in addition to building construction preparatory to the work of an architect?"

Theoretical mechanics, although only an elementary acquaintance of the subject is required by the R.I.B.A. in its examinations, should be studied by the architect as much as by the engineer so far as the general principles are concerned. It is true that great works of architecture were carried out in the past without theoretical knowledge, but then it was made up for by the practical experience of the many craftsmen engaged in building. But this does not argue that an architect can afford to do the same nowadays: the workmen are now almost ignorant. Architecture is a science as well as an art. The engineer has already displaced the architect to a large extent, and unless the latter brings himself in line with the needs of the present day he will degenerate into a mere applier of ornament. If anyone is desirous of becoming an architect he should first see that he has a good general education and has an aptitude for the work. The following should then be studied, and understood:—Building construction, strength of materials and their properties, geometrical drawing, elements of perspective, freehand drawing, and planning. To inculcate beauty of proportion in mass, graphic design and colour study Nature and the reason of her forms—her architecture as it might be called. It need not be supposed that this course of study is so thorough that it would leave no time for practical work, for at present much time is wasted in studying quantity surveying, surveying and other such subjects that should be left to those who make them their special businesses. If you are to succeed you must have that enthusiasm that will keep you ever learning. H. K. D.

Size of Gas-pipes.

NEWCASTLE-ON-TYNE.—A. R. writes: "According to the table of diameters of gas service pipes given in Hurst, to supply two lights requires a $\frac{1}{4}$in. pipe; six lights, $\frac{3}{8}$in. pipe; and twelve lights, $\frac{1}{2}$in. pipe. Does this mean that a $\frac{3}{8}$in. pipe is supposed to supply no more than six lights, or that it will supply from six to eleven lights? If the latter, then a $\frac{1}{4}$in. pipe would supply five lights."

The meaning is that as a $\frac{1}{4}$in. pipe will only supply two lights, the next size, or $\frac{3}{8}$in., will be required for any greater number up to six; and for any number between six and twelve a $\frac{1}{2}$in. pipe will be necessary. HENRY ADAMS.

Books on Gas Manufacture.

LEWISHAM.—S. D. T. writes: "Kindly mention the name and publisher of a concise book on the erection and working of gas plant."

Messrs. E. and F. N. Spon, Limited, of 125 Strand, publish a book on "Gas Works: their Arrangement, Construction, Plant and Machinery," by F. Colyer, M.Inst.C.E., price 12s. 6d. Messrs. Crosby, Lockwood and Son, of 7 Stationers' Hall Court, E.C., published a book on "The Construction of Gas Works," by S. Hughes, C.E., enlarged by W. Richards, C.E., price 5s. 6d.

Portland Cement.

EDINBURGH.—D. K. writes: "(1) Does mixing Roman cement with Portland cement increase the strength of the latter? (2) What is the latest method of making Portland cement in England and America? (3) Is Portland cement imported here; if so, where from? (4) Who are the best makers, foreign or English? (5) Who are the best English makers?"

(1) The admixture of Roman cement to Portland cement decreases the strength of the latter. Roman cement is sometimes added to hasten the setting of Portland cement, and also for jerry work where cheapness is the first consideration. (2) During the last decade several new methods and new machinery have been introduced by English manufacturers for improving and cheapening various parts of the process for converting the raw materials, chalk and clay, into the finished cement; so that it is difficult to definitely state which is the latest method, taken as a whole. The most important and latest improvement in cement manufacture is the rotatory process together with the use of oil as a substitute for producer-gas. Mr. G. L. Anderson, manager of the London Portland Cement Company, Northfleet, has introduced several German improvements and is also the inventor of other improvements in the manufacture of Portland cement. With regard to the latest American methods, the new works of the Nazareth Portland Cement Company at Nazareth, Pa., may be cited as one of the latest, if not quite the latest. When the plant was first constructed, an attempt was made to utilise the heat in the gases from rotatory kilns for generating steam in the boilers of the power plant. The gases from each kiln were led to a vertical boiler, which could also be fired with coal on an ordinary grate if the demand for steam required it. A chimney carried off the gases from each boiler. When the plant was put in operation, trouble with the draught was encountered, so the capacity of the kilns for burning clinker was greatly reduced. This was due to the fact that when the grates were fired with sufficient coal to work the boilers at the requisite pressure, a certain amount of back pressure was set up, which naturally retarded its own fire. It was then decided to give up the attempt to utilise the heat from the kilns, and to substitute coal in place of oil as a fuel for them. The Nazareth works have seven rotatory kilns, giving the plant a capacity of 1,000 barrels a day. The Atlas Cement Company, Pennsylvania, has the largest and most complete installation of rotatory kilns in America, if not in the world. There are over 50 kilns in operation and the output approaches 12,000 tons per week. (3) Portland cement is imported to England from Germany and Belgium. (4) For general soundness and uniformity of quality no foreign cement equals the best brands of English Portland cement. (5) Having regard to the fact that the majority of Portland cement manufacturers are now combined under the title of the Associated Portland Cement Manufacturers (1900), Limited, it would be difficult, not to say invidious, to state who are the best English manufacturers. WILLIAM MILLAR.

Paving for Brewery Floors.

DERBY.—C. B. S. writes: "What is the most suitable paving for brewery floors? I want something which will withstand the action of the acid in the barm and other substances connected with brewing."

I should recommend either patent Victoria stone slabs or adamant paving slabs, laid on a 4-in. bed of concrete, as they are strong, durable, impervious and well able to withstand the action of acids, &c., as well as any heavy blows by the fall of casks, &c., if the stone is on concrete. W. H. M.

Oak Shingles for Roofs.

PETERSFIELD.—A TILER writes: "Where may wood shingles be obtained? Are they fixed in the same way as tiles, and what are their dimensions and thickness? Do they warp?"

Having occasion to re-shingle the spire of Merton Church in 1895, the architect, Mr. H. G. Quartermain, experienced considerable difficulty in finding a man to do the work. It was eventually undertaken by Mr. Charles Bassett, church spire shingler, of Wadhurst, Sussex, who had just previously done Wimbledon Church, where he used no scaffolding except some ladders. At Merton, which has a low spire, he had a ladder, but worked from a cradle slung up to the vane, and he was served by one labourer. The old shingles had lasted for just one hundred years. Warping always occurs more or less, but generally less, as the shingles are *split* oak, 4in. by 12in. by $\frac{1}{2}$in., nailed with 2in. *copper* nails to a 4in. gauge, like tiles. G. A. T. M.

Gothic for R.I.B.A. Testimonies of Study.

YEOVIL.—PERPLEXED writes: "Which is the best book from which to draw the Gothic carving sheet (No. 6) for the Testimonies of Study, R.I.B.A. Intermediate Examination? Should one example be drawn to a large scale, or several small ones? How much is expected in the written memoranda? Should this be a description of the example from which the drawing is made or of the style generally which it illustrates?"

If the drawing be copied, Collings' "Gothic Ornament" is the best book to take it from; but it ought to be done direct from the actual stone or wood. Good examples of Gothic enrichment in bench ends, capitals, &c., are to be found in almost every country church in England, so that there should be no difficulty in selecting something suitable for the purpose. Only one example is necessary, and it should be drawn not smaller than half full-size—full-size is better. The written description should refer mainly to the object itself, its date, style and use; but a short account may well be added of the building in which it occurs, illustrated by a sketch plan on which the position of the object should be indicated.

G. A. T. M.

Period of Years' Purchase.

BRISTOL.—SURVEYOR writes: "Do the arbitration or other courts lay down any *fixed* number of years' purchase for the compulsory sale of freehold ground rents; and, if so, how many years' purchase? If there is no *fixed* rule, what is the usual number of years' purchase allowed? Would 10 per cent. for compulsory sale be allowed in addition?"

[The above query appeared on page 82 of our issue for March 6th last. The following is a further reply to it.]

A usual scale of value for freehold ground rents is:

3 per cent. (33⅓ years' purchase) for very well secured ground rents;

4 per cent. (25 years' purchase) for fairly well secured ground rents;

5 per cent. (20 years' purchase) for unsecured ground rents;

their locality and the special conditions of each case causing however a good deal of variation from this scale. Ten per cent. is a very usual addition for compulsory sale. G. S. M.

Shop Fittings.

HEATON MOOR.—SEB writes: "Kindly name a good book on shop fittings."

We are not aware of any good work on the subject.

Supply of Scantlings.

SALISBURY.—A. X. writes: "Having several farm buildings in course of erection, I find the timber supplied by the contractor (especially 4in. by 2in.) of an inferior quality, and anything but free from sap. I am told that it cannot be obtained any better without being cut out of, say, 8in. by 2in., the reason given being that the forests are running short, and the 4in. by 2in. scantlings are cut out of the very smallest timber. Is there any truth in this statement?"

This question may to some extent be answered by reference to Dr. W. Schlich's lecture before the Society of Arts, as briefly reported in the BUILDERS' JOURNAL of March 6th last (page 84). There is no doubt that the increased cost of freight and the increased distance from the Baltic seaboard of exploitable timber of good quality has caused a large quantity of small trees of immature growth and inferior quality (for which years ago there was no need owing to the ease with which larger trees could be obtained) to be put on the market—a state of affairs which no doubt will rather tend to become more accentuated than otherwise as time goes on. That small scantlings of good quality can still be procured there is no doubt, but the cost is much greater than formerly, because trees producing that quality of wood amount to more money if converted into the largest scantlings possible, and should the English builder want high-class timber he must be content to have it cut out of baulk—especially if he needs it in long lengths. The following comparison of prices paid by myself at a station about twenty miles from a port may be of interest:—

	August 1898.	June 1900.
3in. by 2in. red deal 4in. by 2in. " " 5in. by 2in. " "	1s. 3½d.	1s. 5d. per ft. cube.
9in. by 3in. " "	4½d.	5¾d. per ft. run.

the quality in each case being identical. In both years the 5in. by 2in. was for rafters in lengths of from 18ft. to 20ft. G. S. M.

Mr. William Charles de Boinville, architect, of Plymouth, met his death recently by a street accident.

THE ÆSTHETIC TREATMENT OF BRIDGES.

AT a meeting of the Institution of Civil Engineers held on March 12th a paper was read by Mr. Joseph Husband, A M.Inst.C.E. It was devoted to the consideration of the æsthetic appearance of bridge structures in general, as resulting from various methods of treatment in design. The opening portion had reference to some fundamental laws of æsthetics which it was desirable to observe in general design, at the same time pointing out the connection between æsthetic and economic treatment. The effects on æsthetic appearance of the necessity for rapid construction, choice of material, difficulties of site and magnitude of structure were noticed, together with the importance of making allowance for these in criticising completed works. Adverse criticism was shown to be frequently due to comparison with wrong or unsuitable standards, especially in the case of very large structures. The strong connection between true economy and æsthetics, as evidenced by natural examples, was next mentioned, and the relation of these to artificial structures was considered. General requirements, such as simplicity in design, proper employment of materials and choice of the most pleasing outline where option existed between two or more economical schemes, were noted, as well as the inadvisability of attempting to lay down rules for regulating æsthetic design. Some cases existed in which external ornament might be appropriately employed with economy, whilst many others were totally unsuited for such treatment and suffered detraction if it were followed; and again, abuse of ornament led to æsthetic failure.

Bridge structures in general were, for convenience of consideration, divided into three distinct classes—those built entirely of masonry, those constructed entirely of metal, and those in which masonry and metal both figured. These broadly corresponded to works of small span, large span and intermediate span respectively. The strong relation between masonry types and architecture was noticed, and the various features of the masonry bridge were considered in detail. The effect on the general appearance of different modes of treatment as applied to the arch-ring, spandrels, piers, abutments and parapet, was commented on, and several instances were cited in which the due observance of the primary laws of æsthetics improved the design without militating against economy. Criticism of masonry structures almost invariably reverted to comparison with architectural standards—often an unfair procedure. Several existing structures were referred to in illustration of the points considered.

The second class of structures, consisting of bridges constructed entirely of steel or iron, was sub-divided into representative types, each one being considered separately. Emphasis was laid on the necessity for employing a totally different standard of comparison in estimating the æsthetic value of such works, adverse criticism being frequently due to the neglect of this requirement. True æsthetic effect in these structures was due in a much greater degree to a correct observance of simple and economical design, and the adoption of the most pleasing outline consistent with other conditions, the use of applied ornament being almost æsthetically impossible and economically harmful. Several examples of cantilever, suspension and arched bridges were referred to and illustrated, as well as lofty viaducts carried on metal piers. The various features of each as affecting æsthetic appearance were noticed and cases were instanced in which special difficulties in the way of construction and site had prohibited the employment of a pleasing outline, whilst economy in design had still been preserved. The most recent examples of large bridge structures were cited wherever possible in demonstration of the points at issue. In dealing with the large-span arch, distinct varieties of outline were illustrated, and the relative merits of each were discussed from an æsthetic point of view. A short notice was devoted to the use of more or less ornate masonry towers in connection with the steel arched bridge.

In the third class of structures were considered large-span bridges having masonry piers of such magnitude as to exert a considerable effect on their æsthetic appearance, the most successful examples being those from which architectural ornament had been strictly excluded, and in which a simple but massive treatment had been followed in harmony with the dimensions of the superstructure. In this section were also treated the various types of girder bridges of smaller span, many of which, although possessing little claim to æsthetic value, might yet be rendered more pleasing in appearance by careful attention to several salient features in their design.

The paper concluded with a brief notice of the employment of cast-iron ornament in bridge structures, examples being quoted in which its adoption might be desirable, and others in which, by militating against economy, the fundamental principles of æsthetics were also violated. Instances of its eminently successful application were mentioned, and illustrations were supplied showing the comparative æsthetic effects of the use of cast-iron and steel in structural work.

LICHFIELD CATHEDRAL RESTORATION.

THE fabric of Lichfield Cathedral, after an expenditure of about £105,000, is now in substantial repair throughout, and according to the Dean (Dr. Luckock) all the wealth of statuary and ornamental work destroyed by the Parliamentarians during the siege has been renewed. Before 1892 £80,000 or more had been spent on the restoration. In that year the Dean and Chapter asked for £14,000 to complete all that was necessary to be done, but they have received no less than £24,000, of which nearly £9,000 was especially for sculpture and ornament. Since 1892 there have been three marked epochs in the work of reparation. In 1895 the Lady Chapel, with its seven large windows of splendid sixteenth-century Flemish glass, was enriched by two more of the same date and school, accidentally discovered; by a highly-decorated triptych carved by the peasants of Ober Ammergau; by ten alabaster statues of the virgin saints of the calendar; and many other rich ornaments, at a cost of £3,000. In 1897 the chapel of St. Chad, which had been destroyed in 1643, was fully restored, and all the windows were filled with stained glass at a cost of £1,200 given, by the Dean. The last epoch is the presentation of numerous very costly offerings, including 47 statues of stone and alabaster, bringing the number up to 200, and leaving not a single niche vacant within or without. No fewer than eighteen or twenty windows, some very large, have been lately filled with stained glass. Side by side with the development of the ornamental work the repair of the fabric has gone on uninterruptedly, and consumed as much as £15,000 in eight years. It is said that for the £2,000 collected for sculpture, &c., during the last year not a single person who was asked declined.

Surveying and Sanitary Notes.

Withernsea Improvements.—The Urban Council have decided to complete the purchase of Beech Cottages for £400, to be converted into Council offices, and to enter into negotiations for purchasing certain land for widening Queen Street South. Mr. J. Villiers, Beverley, is to be engaged to make a trial bore for the proposed water supply, and the clerk has been instructed to obtain contracts for the purchase of 10,000 square yards of land forming the Mere, and also for the purchase of the Withernsea Gardens, comprising 2½ acres. The surveyor will also prepare a plan of a proposed new road from north of the Chapel-of-Ease across the Swan Estate, to the Waxholme Road.

R. I. B. A.

MR. HARRISON TOWNSEND ON MOSAIC.

A MEETING of the Royal Institute of British Architects was held on Monday evening, Mr. William Emerson (the president) occupying the chair. Mr. Alexander Graham regretted to announce the death of Mr. Newton Edward Jennings, of Melbourne, Australia, who was elected a Fellow in 1867. The president said that in response to their request the King had been pleased to offer the Gold Medal in continuance of the favour granted by the late Queen. The president also drew attention to the fact that the Architects' Benevolent Society was badly in need of funds, and he appealed to members for contributions. Last year an appeal was made to 5,000 architects, but only 90 responded; this, in his opinion, did not reflect credit on the profession. Mr. J. Macvicar Anderson had given £50, and would increase his donation to £100, provided nine other gentlemen would do the same, so making up £1,000. About five gentlemen have since done this. Mr. J. H. Brewerton, of Bournemouth, was elected a Fellow. Mr. C. Harrison Townsend then delivered his lecture on "The Art of Pictorial Mosaic."

In introducing his subject, Mr. Townsend remarked on the paucity of published matter dealing with the history and practice of mosaic-work as a whole. M. Gerspach's "La Mosaïque" and Professor Middleton's short article in the "Encyclopædia Britannica" represented the only endeavours towards a general history or a comparative criticism of the art. For the purposes of the present paper he proposed to consider the subject from the period when Christianity claimed the aid of mosaic work. The earliest examples handed down to us are of the fourth century. Ciampini's theory that the Church of St. Costanza in Rome had been originally a temple of Bacchus was based on the nature of the ornament; but M. Müntz holds that the mosaics are of Christian origin, though under strong Pagan influence. A fragment of mosaic found in the cemetery of St. Callisto, Rome, and now in the Vatican, is apparently of the fourth century, and is interesting as being probably the earliest representation of the traditional features of Christ. The home of the martyrs Prudentiana and Prassede, consecrated by the Pope in the second century, was largely altered in the fourth to adapt it to the purposes of a church, when the very beautiful mosaic work, still existing though much restored, was executed on the vault of the apse. This work, which shows the high level to which mosaic art had attained in the fourth century, may be regarded as a compendium of the early or Roman manner, untinctured by the influence, later to be predominant, of the Greek canons and ideals. Constantine, after his removal of the seat of empire to Constantinople in 330 A.D., especially favoured the mosaic artist, and during his reign and that of his immediate successors a great number of churches in the eastern part of the Empire were beautified by this art. St. George's, Thessalonica, was cited. The mosaics in the Baptistery at Naples are of the fourth century, which closed under the growing influence and domination of the Eastern or Byzantine.

In the fifth century (*c.* 422 A.D.) the Empress Galla Placidia, widow of Constantine II., made Ravenna her seat, and it is to her that the city owes three of its treasures—the Baptistery of the Orthodox, the Chapel of the Archbishop, and the Mausoleum of the Empress herself. Describing and illustrating the mosaic work in these buildings, the lecturer drew attention to the pagan symbols introduced in the Christian subjects represented, and remarked on the distinctively Roman treatment of the forms depicted. The very beautiful work in the Mausoleum of Galla Placidia seems, with its absence of gloom yet its dignity of invention, its Roman forms yet its Christian thought, to form the typical example of the fusion of the new and the old creeds. Other examples of fifth-century work still existing were referred to—namely, those at St. Ambrogio, Milan, and St. Sabina, Rome, and the series of mosaics on the Triumphal Arch of St. Maria Maggiore. These latter are particularly important among the early works of Byzantine art and show the last effort for many centuries towards dramatic representation, before pictorial art became crystallised into conventional and traditional forms. The fairly precise reminiscences of the fifth century contained in the mosaic work of the Basilica of St. Paolo fuori le Mura, which retains the scheme of the original mosaics of Pope Leo I. (440-461), show how the earlier—the Roman—symbolism was passing away.

The sixth century is rich in material for study, in both the eastern and western portions of the Empire. The gorgeous mosaics at St. Sophia, Constantinople, completed under Justinian in 559, lay concealed for many centuries under coats of whitewash. But in 1847 and 1848 an opportunity of studying the Byzantine mosaics occurred, and Salzenburg made his well-known series of drawings of the old work. Judging from these, there seems to have been a consistent scheme of decoration, a general tone of harmonious quiet colour, with silver largely used for the high lights, and soft green or blue folds in the drapery, and throughout a feeling of the antique or Roman style as it began to be influenced by the sterner, more rigid canons of the East. Touching the present condition of the mosaics of St. Sophia, the lecturer stated that five years ago he examined, with the aid of strong glasses, the ceiling of the gallery, and came to the conclusion that the present whitewash serves as a substitute for now absolutely vanished mosaics! Mr. Townsend then passed to sixth-century mosaics at Ravenna, describing those at the Baptistery of the Arians, or St. Maria in Cosmedin; St. Apollinare Nuovo, built in 500 A.D. for the use of the unorthodox, and converted into a Roman Catholic church in 570, traces of both influences being present in its treatment; St. Vitale, built A.D. 526, and utilised as a model for St. Sophia, Constantinople; and St. Apollinare in Classe, still, for all its sadness of decay, a magnificent contribution to the history of the art. Regarding the art at Rome at this period, the dominance of the Northern races, after the accession of Theodoric in 493, had led to the selection of subjects appealing to and models selected from the strenuous and vigorous Northerner rather than the dreamy and ascetic Eastern. The work is characterised by freshness of treatment, but with a kind of grim hardness in the type of countenance selected—the Roman ideal at base, but with an all but barbaric respect for physical strength.

Seventh- and eighth-century examples—St. Agnese fuori le Mura and St. Theodore, Rome—were briefly described.

The achievements at Rome and Constantinople during the ninth century must be contemplated in the light of the great dispute of the preceding century as to the representation in religious subjects of the human or divine-in-human form, and the effect that the various Church rulings had exercised on Christian pictorial art. The result was to check the art along the particular lines affected, but to lead to a reaction during the following century, and the ultimate production of many great and important works. Works of the date referred to included the mosaic in the sanctuary of St. Ambrogio; the very beautiful and gorgeous mosaics of the Church of St. Prassede, Rome; and those at St. Marco and St. Cecilia, Rome.

From the second quarter of the ninth century till near the middle of the twelfth the art underwent in Rome a period of absolute stagnation. During this period, however, notable work was done at St. Mark's, Venice—work in which a Greek or Byzantine influence is manifest. At Torcello, in the twelfth century, a magnificent mosaic was placed on the apse ceiling.

The existence of a purely Sicilian school in Sicily is doubtful; it would rather seem that the Normans, under Roger II., called to their service Greek artists. There is much similarity of sentiment between the St. Mark's and the Sicilian work. Reference was made by the lecturer to work of the twelfth century carried out in the following buildings: La Martonara, Palermo; the Cappella Palatina; the Cathedral at Cefalù, in which the characteristics of Sicilian work and its affinity with that done at the same time in Venice, are evident; the Monastery of Daphne, near Athens; the Church of the Holy Sepulchre, Jerusalem; and the Church of the Nativity, Bethlehem.

In the Western world the twelfth century produced at Rome the apse of St. Maria in Trastevere, the character of the work still Roman rather than Greek or Byzantine; St. Francesca Romana, often ascribed to the ninth, but, as De Rossi maintains, really of the twelfth century—a very unusual and beautiful design; St. Clemente, Rome, dated by M. Gerspach as of the thirteenth century, but which Mr. Townsend placed as early in the twelfth, the work exhibiting a treatment rather apart from the usual *motifs* of Roman work.

In the thirteenth century the great scheme at St. John Lateran was executed for the Pope Nicholas IV. by the master-artist Jacopo di Torrita or Torriti, the design being signed by Jacopo and his worthy assistant, Cameroni.

The lecturer next discussed the mosaic decoration carried out in the same century in the Baptistery at Florence and in the Cathedral at Pisa, and the further prosecution in the thirteenth and fourteenth centuries of the mosaic scheme for St. Mark's, Venice.

Rome saw two important works achieved in the fourteenth century, of which perhaps the principal was the completion of the fine work in the apse of St. Maria Maggiore, commenced by Jacopo di Torriti, and of the panels below it executed by Gaddo Gaddi.

In the fifteenth century Baldovinetti executed one of the overdoor spaces at the Baptistery, Venice, and his pupil and Michel Angelo's master, Domenico Ghirlandajo, commenced in the cathedral the decoration of the Chapel of St. Zenobio. The really important work of this century occurs in the Chapel of the Mascoli in St. Mark's, Venice. These mosaics represent the principal legends of the Virgin, and in composition, colour and execution are alike admirable. It is with these panels that one approaches the end of the art of mosaic work; from this point one sees the mosaist, designer and executant in one, make room, to the ultimate destruction of his art, for the painter, who called to his aid the "dull mechanic" hand of a workman to represent servilely oil-painted pictures by means of cubes of glass

The state of design rapidly became worse and worse. The seventeenth and eighteenth centuries saw work accepted and praised which transgressed, in its realism, its exaggerated movement, its rendering of accidentals, all the rules and canons that should regulate mosaic work.

But it was reserved for the nineteenth century to strike the worse note of imitation, and not only to execute indifferent mosaics, but to falsify the history of the Church as recorded by and on its walls, by treating their mosaic designs as pseudo-thirteenth-century work.

The author concluded with some observations on recent mosaic art in England. It cannot be said that some of the works are successes, save as to execution. The artist seems unwilling to suppress, as the loyal mosaist should, many of the attributes of which, under other circumstances, he might justly be proud. The author expressed his conviction, however, that it would have been impossible to find in either France or Italy an artist who would have carried out work recently executed in England without falling still more egregiously into the errors which the great examples of the past showed to be present therein.

A discussion followed in which Mr. Walter Crane, Mr. C. Anning Bell, Mr. T. Spence, Mr. L. P. Crace, Lieut.-Col. Prendergast, and the President took part. In the course of his remarks Mr. Crane referred to the saying of William Morris that mosaic was like beer—a little of it was no good. It was useless to apply it on a building in snippets. He hoped that mosaic would be much more commonly used in the future.

Masters and Men.

The Kirkcaldy Building Trade.—The local Society of Operative Masons have received intimation from the Masters' Association that they intend to reduce the wages from 8½d. to 8d. per hour, commencing at the end of May. The Society have unanimously agreed not to accept the reduction, as they believe the state of trade in the district does not warrant it, seeing ½d. per hour had been taken off the wages last year. The operative joiners also have received notice of a reduction from 8d. to 7½d. per hour. They also have decided not to accept the reduction. Notices have been posted at most of the buildings of a reduction of the bricklayers' wages from 9½d. to 9d. per hour.

The Amalgamated Society of Carpenters and Joiners in its monthly report affords evidence of the lessening activity in the building and allied trades in a further increase of the unemployed list. There are now 3,127 members on out-of-work donation out of a total roll of 65,529, representing 4¾ per cent. with 1,654 on sick benefit. In the Manchester district, out of 3,103 members, 180 are on the unemployed list, which is about 6 per cent., as compared with 5 per cent. a month back, and trade locally is described as "bad." Proposed reductions in wages have been abandoned in Glasgow and Dundee, and the notices have been withdrawn; but the dispute at Belfast is still unsettled.

The Norwich Bricklayers' Strike still continues. The Norwich Master Builders' Association are in receipt of no fewer than three further demands for higher wages. The Amalgamated Society of Carpenters have given notice for an advance of a ½d. an hour and a proportionate increase for overtime, to take effect on June 1st 1901. The Navvies, Builders' Labourers and General Labourers' Union are asking also for a ½d. advance, to take effect on June 1st, and the Amalgamated Society of House Decorators and Painters demand an increase of 1½d. an hour, the present rate being 6d., and various alterations of the rules which would, if granted, bring about a reduction of working hours, and would transfer to the painting trade all whitewashing and distempering done with hair brushes.

The Great Building Trades Strike at Chicago terminated recently. The strike had lasted a year, and originated in the excessive demands of an organisation known as the Building Trades Council, a federation of the different building trades unions. Sympathetic strikes were the means by which the decisions of this council were enforced. Apprentices were absolutely abolished, and the entrance-fees into the unions raised to such a point as to practically bar the admission of new members, and no non-unionist was permitted to work. The abolition of stone-cutting machinery was decreed, and the most rigid rules adopted as to the demarcation of work and as to limitation of output, the amount any man might do per day being strictly defined by various schedules, the result being a reduction of about half the amount previously done. Strikes extending to all the trades were declared on the most trivial pretexts. The different contractors of the city formed a federation and framed a set of rules themselves, under which only would they consent to engage a workman. These rules contended that there should be no limitations on output, nor restriction on the use of machinery, nor on the use of goods save those originating in prisons. No interference with workmen by outside parties during working hours was to be permitted, nor were apprentices to be prohibited. Perfect freedom in the engagement and dismissal of men was also claimed. These conditions were rejected by the Trades Council, and the strike commenced on February 5th, 1900. In its earlier stages it was marked by a great display of violence on the part of the strikers. The employers have now gained a complete victory. For skilled labour the wages range from 16s. 8d. down to 12s. 6d. per day, whilst labourers are paid from 10s. down to 8s. 4d. per day.

Professional Practice.

Beeston, Nottingham.—The foundation stones of a new Wesleyan church were laid last week. The premises comprise a church with nave, transept and choir gallery, and a school in the rear portion of the site. In the church, which has a gallery round three sides, there is accommodation for about 750 persons. Ample vestry accommodation is provided for the minister, choir, &c. The organ will be placed behind the choir gallery and the rostrum in front. The school premises consist of a large assembly room, an infants' school, an adults' class-room, a ladies' room, and seven class-rooms, which are grouped round the large room and open out of it. The exterior, designed in the Decorated Gothic style, is of pressed bricks with facings and tracery windows of rich design in stone. The entrance front faces Chilwell Road and at the south-west corner is placed a tower and spire rising to a height of about 100ft. The interior woodwork of the roof and pews is pitch pine, the roof being waggon-headed in shape. The tracery windows will be filled with ornamental tinted leaded lights. The cost of the entire building will be about £7,000, and the church portion is at present in course of erection. The architect is Mr. W. J. Morley, F.R.I.B.A., of Bradford and Harrogate.

Horfield, Bristol.—A new Franciscan Church of St. Bonaventure has been erected on a site adjoining the Friary at a cost of about £4,000. The design is Early English in style, and consists of a nave, chancel, side chapels, aisles, baptistery, confessionals, a choir at the west end, and another choir for the friars over the chapel on the Gospel side, pierced with arched openings into the chancel. The nave consists of five bays. The bays at the west end are flanked by the tower on the Apostle side, and by the baptistery on the Gospel side. The nave is divided from the aisles by an arcading supporting the main principals of the roof, which has a span of 48ft., and cover both nave and aisles. The arches of the nave are over 30ft. high, and are striking features of the church. The chancel is divided from the nave by an arch 37ft. in height, and is lit by three lancet windows in the bay of the aisles. The confessionals are placed on the Gospel side of the church, with openings formed through the aisle wall. The west end of the nave is pierced with three lancet windows. The entrance door is in the centre of the nave wall, and there is a smaller door in the tower, opening into the porch. The organ chamber is approached by circular stairs, built at an angle of the tower. The baptistery is apsidal in form, and is lighted by a lancet window in each bay. The tower, baptistery, and west-end bay were not included in the contract for £3 800. The total length of the church is 90ft., the width of the nave being 22ft., the width across the church 48ft., and the height from floor to roof 50ft. The church is built of rubble stone with Bath stone dressings, and facings of blue stone. It will accommodate about 350 persons. It was designed by Messrs. Pugin and Pugin, including the Friary. The contractors were Messrs. R. W. Wilkins and Sons, of Bristol, and Brother Patrick acted as clerk of works.

Kirkdale, Liverpool.—A new Baptist Church is being erected at the corner of Walton Lane, Fountains Road, and Barry Street, directly facing the Anfield Road entrance to Stanley Park. The buildings, which are designed in Classic style, freely treated, will consist when completed of a large basement schoolroom, 49ft. by 45ft., with accommodation for 400 persons. On the same floor there will be five spacious classrooms and conveniences, with two staircases. The whole of the basement will be well lighted, the chapel being raised considerably above the surrounding footwalk. The schools will be approached by two flights of stone steps, six feet wide, from Fountains Road and Barry Street, and the whole of this floor will be laid with pitch pine wood blocks. The ground floor consists of a chapel, 54ft. by 43ft., with large side transepts, and deep recess in back gable for pulpit, and will have accommodation for 400 adults. On this floor there are to be two large vestries. The main entrances to the chapel are from Walton Lane and Fountains Road, and lead into large entrances containing the gallery staircases, and then to a vestibule before entering the chapel. The gallery, which is situated on three sides of the chapel, will provide seating accommodation for 316 persons. The side galleries will have two rows of pews, and the end gallery and transepts seven and eight respectively. The pulpit will be placed in the chancel, with the baptistery immediately in front. The main front of the chapel will face Walton Lane, with a main gable flanked on each side with staircase wings and porches. The three principal elevations will be carried out in red-pressed Accrington brick, with Cefn stone dressings. The whole of the building will be heated with a low pressure system of hot water. The building is to be lighted throughout with electricity. The total cost, exclusive of land, is about £5,000, and the contractors are Messrs. Hough and Pilling, of Liverpool, and the architects Messrs. Richard Owen and Son, Crosshall Street, Liverpool.

Portsmouth.—A new drill hall has been erected in Stanhope Road for the 3rd (Duke of Connaught's Own) Volunteer Battalion the Hampshire Regiment. The site was given by the Admiralty authorities in exchange for the old one. The cost of erecting the new building has also been paid by the Admiralty. The principal frontage is to Stanhope Road. The material is dark red brick with Bath stone dressings. There are a large square tower, with a miniature tower on it, over the main entrance, and castellated towers at three angles of the building, and a small circular tower at the Edinburgh Road corner. The building consists of a large hall space, round which are grouped the various offices. The central hall itself measures 144ft. by 118ft., the height to apex of the roof is 68ft., while the distance from the ground line to the eaves is 33ft. There is a smaller hall, measuring 76ft. by 44ft. The roof of the great hall is of wrought iron lattice girders, springing from below the ground line, the feet being bolted down to blocks of concrete. These span the great hall completely, and on them are fixed the purlins and rafters, &c., relieving the walls of the weight and strain of the roof, and leaving a clear floor space. The contract for the roof was carried out by Messrs. Andrew Handysides and Co., Limited, of Derby. The floor has been laid with tar paving by Messrs. Bradshaw, of Southsea. The walls have been coloured with Aspinall's water paint. The hall is lighted by large windows, but for evenings eight arc lamps will be used. The smaller hall is fitted up as a gymnasium, and is also used as a recruits' drill room. The floor is of Ebner's pitch pine blocks, laid diagonally. On the first and second floor levels are two balconies, partly surrounding the great hall, and approached by stairs from each end of the hall. The upper balcony gives access to the officers' mess-room, which is divided into two rooms by means of a folding partition, the smaller one being furnished and fitted up as an ante-room, and the larger forming a dining hall. A dressing-room and lavatory for officers adjoin, while above this, in the tower, is an extensive kitchen, with lift, and on the floor beneath is a scullery. From the kitchen a ladder leads up to the roof of the tower, nearly 100ft. above the ground level. The lower balcony, which extends along one side, and partly along the two ends of the great hall, is devoted to the offices. Here is the sergeants' mess, measuring 60ft. by 26ft. Adjoining the mess is a large room, which has been let to the Portsmouth troop of the Hampshire Yeomanry (Carabineers). The quartermaster's store and office, and a committee room, are to be found on this floor, while there is also an entrance to the caretaker's apartments, which are comfortable and convenient. Below this suite of rooms and on the ground floor are other offices, &c. An armoury occupies the central space on this side, and close to it there is a small magazine for holding the spare ammunition. It is specially built, and protected by an iron door. The commanding officer's room and the orderly-room lead from it. There is a machine-gun room, capable of holding two or three of these guns, in addition to the harness used for the battalion transport; a band room, and several stores, besides lavatories. In the corner are the junior non-commissioned officers' club room and the canteen and men's recreation room. All the rooms are decorated in the same style—pink walls, with a dark terra-cotta dado with lighter filling, and a pale brick red frieze. All the paint work is executed in two greens—one considerably darker than the other, with the sole exception of the officers' mess. The wood work of the latter is in teak. The entire building is fitted with electric light, the whole of the fittings having been executed by Messrs. Pyke, Harris, and Co., of Westminster. The plans were prepared by Major A. H. Bone, of Cambridge Junction, Portsmouth; the builder was Mr. J. Crockerell, of Victoria Road North, Southsea; and Mr. G. Felton Lancaster has been the clerk of works.

St. Helens.—The new Grange Park Hotel has been erected for Messrs. Greenall, Whitley and Co., in Sandy Lane. The building is in the Late Domestic English style, the front being of Ruabon brick with stone dressings. The roof is covered with red tiles, with overhanging eaves. The house is divided into two parts for first and second-class customers. The main entrance to the first-class side is from Sandy Lane. This leads into a large hall, the floor of which is laid in mosaic, with a deep mahogany dado and a ceiling of fibrous plaster. To the left is a commodious smoke-room with upholstered seats and mahogany fittings. Behind that is the dining-room, and on the left again the billiard-room with lavatories, &c. It is lighted from the top by a large lantern light. The bar is in the centre of the house. The entrance into the second-class portion is from a side street and consists of a large bar and smoke-room, with separate lavatory accommodation. The kitchen and domestic offices are at the back and cut off from the remainder of the house. On the first floor is situated a large club-room with a richly-panelled ceiling. The remainder of the floor is occupied by bedrooms, a bathroom, lavatories, &c. On the second floor there are six bedrooms and a boxroom. Outside the hotel there is a four-stall stable, coach house, and bicycle shed. The gas brackets are all fitted with self-lighting arrangements, the tap which turns the gas on also setting it alight. Mr. F. S. Biram, Hardshaw Street, was the architect, and Mr. John Lucas, Prescot, builder. The joiner's work was done by Mr. Halsall, Prescot, and the plumbing, glazing and painting by Messrs. McNelly and Co., St. Helens. Mr. A. Hawksey did the upholstering.

South Tottenham.—A Home for Jewish Incurables has been erected in the High Road, South Tottenham, from plans of Messrs. H. H. and M. E. Collins, of 61 Old Broad Street, who were selected in open competition by Mr. W. Flockhart, of 180 Old Bond Street, the assessor. The contractor was Mr. William Downs, of Hampton Street, Walworth. The building is in the Elizabethan style, and is so placed on the site as to afford the maximum amount of sunshine to the patients. The frontage extends to about 204ft., and whilst visitors enter the main building by steps, gradual slopes have been arranged so that the invalid chairs of the patients may be easily wheeled up them. The building is constructed of red brick and stone, surmounted by red terra-cotta chimneys, and is approached through a garden. The corridors are broad—that approaching the entrance hall being 10ft. in width. Near the entrance hall is the entertainment room, about 47ft. by 28ft. Communicating with this is the office of the secretary. On the ground floor there are—besides the matron's room—four large dormitories, each destined to contain six beds at present, but capable of accommodating double that number, two single bedrooms for special cases, two sitting-rooms, each 29ft. by 25ft., with large bay windows carried down to the floor. Attached to the sitting-rooms is a serving-room and a linen and store room. The rooms are heated by special fireplaces (Teale's patent), which permit of a fire burning for a lengthened period without interference. All sanitary fittings are in a disconnected annexe. The first floor is practically a replica of the ground floor. On this floor are also the matron's bedroom, bath room, &c. On the second floor are the rooms of the nursing staff, consisting of four dormitories and a sitting room. The servants' quarters consist of servants' hall, six men's and women's dormitories, lavatories, and bathrooms. The latter are specially constructed, the baths being partially sunk in the floor, so that paralysed patients can be easily lifted therefrom. The kitchen, 28ft. by 25ft., is at the top of the building, scullery, store and service rooms, all lined with white tiles, being attached. In connection with the kitchen are two lifts for conveying food to the service rooms. Each floor can be reached by means of two stone staircases, in addition to which a special lift for patients is provided, as also a lift for domestic purposes. The building has been so arranged that eventual enlargement is possible. The builder, Mr. Downs, contracted to construct the building for £27,000, and to hand it over to the charity completed and fit for habitation for that sum. This has been achieved without a single extra. The gardens of about three acres will be laid out in lawns and shrubberies by Messrs. Veitch, of Chelsea, and are overlooked by a covered verandah.

Keystones.

A new Church for St. John's District, High Wycombe, is to be erected at a cost of £6,000.

An Oxford Memorial to the Queen.—The little town of Watlington proposes to perpetuate the late Queen's memory by a new lych-gate at the entrance to the churchyard at an estimated cost of £250.

Chinese Exhibition, 1903.—A syndicate is in process of formation for the purpose of holding an exhibition in London in the summer of 1903 of the industries, arts, and sciences of the Chinese Empire at Olympia, Kensington.

A New Cottage Hospital at St. Andrews is to be erected at the easternmost portion of Abbey Park. Mr. Charles F. Anderson, architect, of St. Andrews, is preparing the plans. The accommodation will include two male wards, two female wards, and a children's ward, the total number of beds, including cots, being 18.

Burnham Improvements.—A Local Government Board enquiry was recently held into the proposal of the Burnham Council to borrow £1,200 for the erection of shelters, band stand, and two public conveniences on the promenade. It is hoped to make the present work part of a scheme to be developed when possible, by which the entire sea front will be enlarged. Mr. W. J. Press, surveyor to the Council, has prepared the plans.

The Home Arts and Industries Association will hold its seventeenth annual exhibition of the work done in the classes of the association from May 16th to 20th in the gallery of the Royal Albert Hall. The exhibition will include specimens of wood carving, inlay, metal repoussé, embossed leather, baskets, spinning and weaving, lace, toys and rugs, and of other arts and industries. There will also be exhibits from the Brabazon and Home Art Scheme for Disabled Soldiers and Sailors.

Discoveries at Clonfert Cathedral.—During the restoration of Clonfert Cathedral recently several ancient tombstones and fragments of carved stone have been found lying about, some in the sacristy and others elsewhere. These included a tombstone with a Latin inscription two hundred years old, one with an English inscription equally old, and another, dated 1612, with an inscription in Latin in memory of Richard Callanan. These tombstones have been carefully preserved and placed in the vestibule of the cathedral.

An Isolation Hospital at Chingford has just been opened. The Walthamstow Urban District Council have been their own contractors, and the building has been designed by the Council's engineer, Mr. G. W. Holmes. The hospital stands in five acres of ground. There are seven separate buildings, including the administrative block, lodge and mortuary. The four others are for patients. Three of them contain fourteen beds each, while one has four beds, and will be used as a place of probation for invalids whose maladies have not been clearly defined. The total cost is £30,000.

A Housing Scheme at Liverpool.—The Liverpool City Council propose to demolish over 8,000 insanitary houses. The scheme for re-housing and demolition will cost a million and a half.

Messrs. S. B. Bolas and Company, architectural photographers—their lease of 77 Oxford Street, having been purchased by Messrs Gill and Reigate—have removed to larger and more convenient premises, 68 Oxford Street, opposite the old address.

New Schools at Halesowen, Worcestershire.—The tender of Mr. H. Dorse, of King Street, Cradley Heath, has been accepted for the erection of new schools at Halesowen. Messrs. Meredith and Pritchard, of Kidderminster, are the architects.

Memorial to a Chester Architect.—The master builders of Chester have decided upon placing a stained-glass window representing the figure of "Hiram, architect and artificer," builder of the Temple, in St. John's Church, Chester, as a memorial to the late Thomas Mealin Lockwood, architect, who was for many years a parishioner. The cost of the memorial will be about £150.

The Aberdeen Society of Architects held its annual general meeting recently, when the office-bearers and council for the ensuing year were elected as follows:—President, Mr. Arthur Clyne; vice-president, Mr. D. M'Millan; honorary treasurers and secretaries, Mr. John Rust and Mr. A. H. L. Mackinnon; members of council, Messrs. W. D. Ironside, W. Kelly, W. Ruxton, G. Watt and R. G. Wilson.

The new Burying Ground at Strathaven is being laid out and the roads made by Messrs. Donald and Co., Shettleston. A gravedigger's house and boundary walls with a railing is being erected by Mr. William Allan, builder, of Strathaven. The grounds are being laid from the plans of Mr. Cullen, architect, Hamilton. The principal entrance will be from the Stonehouse Road. The total cost will be £2,500.

Mr. Harold St. George Gray has been appointed to the post of librarian and curator of the Taunton Museum and assistant secretary of the Somerset Archæological Society. Mr. Gray, who is about 30 years of age, has been since May, 1899, chief assistant to Mr. Henry Balfour, keeper of the Pitt Rivers Collection at the Oxford University Museum. Previously he was for ten years secretary and assistant, and finally chief assistant, to the late General Pitt Rivers, H.M. Inspector of Ancient Monuments, who was so well known as an antiquarian and archæologist.

The Garden City Association.—At a meeting of this association held recently Mr. Ebenezer Howard, the promoter of the movement, explained that the view of the association regarding the housing problem was that it could be solved and the congestion in crowded centres relieved by a concerted movement of manufacturers, co-operators and others to new areas. Arrangements could be made for securing to the migrating people the whole of the increased value which their presence would give to the sites, the areas being planned so as to make adequate provision for the individual and social needs of the people, especially with a view to securing for all time the combined advantages of town and country life.

Birmingham University.—A correspondence has been proceeding between the secretaries of the Birmingham Architectural Association and the authorities of the University of Birmingham with regard to the preparation of plans for the new University buildings. Messrs. Aston Webb and E. Ingress Bell have been instructed to prepare sketch plans and the Association requested that a competition should be held on the lines of that for the Victoria Law Courts, in which the sketch plans drawn up by Mr. Waterhouse were supplied to the competitors. The University authorities replied however to the effect that they considered the principle of selecting designs by competition could not be advantageously adopted in their case. This decision the Association protested against, citing the vast scheme of the Californian University as one which has been successfully decided in competition.

In Memory of the late Sir George Grey.—A memorial bust and portrait will shortly be placed in the crypt of St. Paul's (where the ex-Colonial Governor was buried) and the National Portrait Gallery respectively. The bust is the work of Mr. Onslow Ford, and the portrait is an oil painting by Professor Herkomer.

A new Baptist Church at Cradley, Worcestershire, has just been erected at a cost of over £3,700, by Mr. H. Dorse, of King Street, Cradley Heath, from designs by Mr. A. T. Butler, architect, High Street, Cradley Heath. On Saturday evening last 70 workmen who have been employed on the works were entertained at a coffee supper in the Church parlour.

The Berlin Secessionists and English Artists.—Professor Max Liebermann, president of the Berlin Secessionists, has invited Messrs Sargent, Onslow Ford, and Rothenstein to send works to the third exhibition of the Berlin Secessionists, which will be opened in the beginning of May. He expressed his regret that he could not invite a larger number of English artists, owing to the limited space at his disposal.

Hull Royal Infirmary Competition.—The committee of the Hull Royal Infirmary have received the report of the assessors, Messrs. Young and Hall, on the designs submitted in competition for the extensive alterations and additions to the infirmary. They report that "The designs are all of high merit and show that great care and thought have been expended upon them." The awards are as follows:—1st., premium £100, Messrs. Worthington and Sons, Manchester; 2nd, premium £50, Mr. H. Percy Adams, London. The other competitors invited to send in designs were:—Messrs. Roger Smith and Son (London); Simpson and Allen, (London); W. A. Pite (London); Botterill and Bilson (Hull); Jacobs (Hull); and Freeman, Son and Gaskell (Hull).

British Archæological Association. — At a meeting of this association held on March 6th, Dr. W. de Grey Birch, F.S.A., presiding, a paper was read by the Rev. H. J. Dukinfield Astley, M.A., hon. editorial secretary, on "A ramble round Thetford," a quaint and fascinating old Norfolk town, or perhaps it should be called "city," for it was once an Episcopal see. In the fourteenth century Thetford possessed twenty churches, besides other religious buildings. The local authorities of to-day do not appear to have much regard for the antiquities of their historic town, as, in spite of protests, they have recently pulled down the old Guildhall. It was in the reign of William the Conqueror that Thetford became, for a brief period, a bishop's see, and in 1091 the Great East Anglian church builder Herbert de Rosinga succeeded as third Bishop. He did not, however, long remain at Thetford, as in 1094 he removed the see to Norwich. A plan of Thetford Priory, several early editions of antiquarian works. and a fine series of drawings of the "Old Halls and Manor Houses of Norfolk," by the late Mr. E. P. Willin, illustrated the paper.

"**Ecclesiastical Architectural Antiquities in Fife**" was the title of a lecture delivered to the student section of the Dundee Institute of Architecture recently by Mr. Charles G. Soutar. Mr. Soutar remarked that the study of the work of the past ten centuries was fascinating to the mind of the architectural student. He thus gained the instruction of the former masters of the art expressed by the buildings themselves, and imbued something of the spirit which directed the shaping of these unsurpassed creations, a study in which instruction was blended so happily with the rarest pleasure and recreation. After briefly tracing the influences which affected ecclesiastical art in Scotland generally from the time the Irish influence was superseded by that of Rome, through the various stages of the Gothic art, he took up severally the principal examples of structures showing these influences found in Fife, amongst which were the following in the order of their foundation:—The Monasteries in St. Andrews, Church of St. Regulus, Cathedral of St. Andrews, Balmerino Abbey, Abdie Church, Newburgh, Leuchars Church, St. Monance Church, Crail Church, Cupar Church, St. Salvator's or College Church, St. Andrews, and Dairsie Church.

A new Public Hall at Blaengwynfi is being erected at a cost of £2,800.

The Royal Institute of British Architects.—His Majesty the King has graciously consented to continue to be the patron of the R.I.B.A., and to offer, as was done by her late Majesty for over fifty years an annual Royal Gold Medal, to be presented on the nomination of the Royal Institute to a distinguished architect or architectural writer of any nationality.

St. Mary's Convent School at Nottingham is being erected for the Roman Catholic community in Derby Road. The schools will provide accommodation for 143 infants, 168 boys and girls mixed, and cooking class-room for 48 girls, with playgrounds approached by separate entrances from Tunnel Road. The architect is Mr. John Howitt, F.R.I.B.A., and the schools are being built under his supervision by Mr. Henry Vickers, at a cost of £4,250.

The Tomb of the late Lady Abbess d'Aurillac Dubois, of Stanbrook, has been both designed and executed by women. The figure of the Abbess, who lies outstretched upon her tomb, in much the position of the old Crusaders on theirs, her head a little lifted on a cushion, her robes lying in long, straight folds, is the work of Dame Beatrice, one of the Benedictine nuns at the Abbey. The little bas-reliefs that decorate the alabaster base are also modelled by Dame Beatrice, while the base itself was designed and the entire tomb executed by Miss Abbot and Miss Ferguson, with whom she worked before entering the convent.

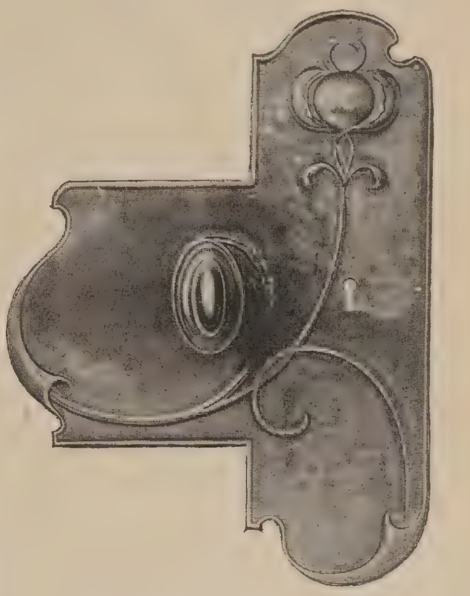
The Church of Swaffham-Prior St. Mary is in process of repair and restoration, and will shortly be completed and ready for use, after a lapse of nearly ninety years. During this period the sacred edifice was in a ruinous condition. Funds are being sought for to repair the fine old Norman tower which forms a distinguishing feature of the building. Apparently there has been some idea of rebuilding the steeple, which formerly surmounted the tower, and the upper part has been left ragged and loose, with the result that exposure to the weather has rendered it insecure.

New Police Buildings at Warrington are being erected. The buildings will have frontages to Wilson Patten Street, Museum Street, and Arpley Street, and will cover an extensive area. The dimensions of the police court are 52ft. by 40ft., coroner's court 44ft. by 21ft., and the parade ground, which will be covered, 97ft. by 50ft. The buildings will be fitted throughout with electric lights and bells, and the ventilation of the premises will be worked by a novel electrical system. The plans have been prepared by Mr. R. J. Burns Dick, and are being carried out under the supervision of Mr. Hallard, clerk of works.

The Northern Architectural Association held its annual meeting last week. Mr. Frank Caws, F.R.I.B.A. (president-elect), occupied the chair. The address of the retiring president, Mr. William Glover, was read in his absence by the hon. secretary, Mr. A. B. Plummer. Mr. Glover offered at the opening of the winter session of 1901 to add an extra prize to all the students who gain the institution prizes, also to the students to whom the assessors give "honourable mention." Mr. Arthur B. Plummer then read the annual report of the council for the 42nd session. Increasing success was therein recorded, and it was stated that the membership was as follows:—Ordinary members, 54; associates, 71; students, 61—total, 186. Mr. J. T. Cackett, hon. treasurer, read a financial statement showing that the year was commenced with a credit balance of £54 9s. and concluded with a balance of £89 4s. 6d. on the same side. Mr. H. C. Charlewood submitted a report as librarian and the hon. secretary another upon the work of the students' sketching club. The following officers were declared to have been duly elected:—President, Mr. F. Caws; vice-president, Mr. J. W. Taylor; hon. secretary, Mr. A. B. Plummer; hon. treasurer. Mr. J. T. Cackett; hon. librarian, Mr. H. C, Charlewood; council, Messrs. R. B. Dick, J. W, Donald, R. J. Leeson, J. Oswald and T. Reay; associates, Mr. J. W. Boyd and Mr. R. P. S. Twizell.

ARTISTIC DOOR FURNITURE.

THE increasing adoption by women of trades and professions in which men have hitherto exclusively practised is a significant feature of the times, and one which augurs much for the future. In each new field which they enter as competitors, women have to encounter the same masculine opposition, and though they are quite unsuited for certain classes of work which have been tried by them, yet in numerous other occupations they have proved that they can achieve considerable success. We are becoming accustomed to hear of lady sanitary inspectors, lady bookbinders, lady doctors, and even lady architects—not to mention lady lawyers, preachers or auctioneers —and there seems no reason to doubt that the future will see ladies largely engaged in house decoration, plaster modelling and similar work. As an indication of this wider field of employment for ladies we may refer to Mrs. Starkie Gardner, who makes a speciality of repoussé work in all metals, particularly iron, brass, copper and pewter. At 18 Clifford Street, Bond Street, W., specimens of her work, and also that of the several ladies under her superintendence, may be examined. Mrs. Gardner produces all kinds of articles but makes a speciality of door furniture, an example of which is shown by the above illustration of a finger plate. Those needing artistic fittings of this kind should pay a visit to 18 Clifford Street.



TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

ASHFORD, Middlesex.—For the erection of a new Board school at Feltham Hill Road, for the Ashford School Board. Mr. Richard J. Lovell, architect, 46 Queen Victoria Street, London, E.C. Quantities by Messrs. Fleetwood, Son & Eversden:—

G. Hill & Co., London	£4,854
Foster Bros., Norwood	4,736
J. Cracknell, Peterborough	4,718
J. H. Kingerlee & Sons, Oxford	4,615

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Professor Henry Robinson, M.I.C.E., on "Sewage Disposal," 7 p.m.

Wednesday, March 27.

SOCIETY OF ARTS.—Mr. A. A. Johnston on "Clocks Carillons and Bells," 8 p.m.

CITY OF LONDON COLLEGE SCIENCE SOCIETY.—Mr. A. T. Walmisley, M.I.C.E., on "Building Stones," 7.30 p.m.

EDINBURGH ARCHITECTURAL SOCIETY.—Mr. W. Scott Morton on "Aids and Hindrances to Design."

SANITARY INSTITUTE.—Lectures and Demonstrations, for Sanitary Officers, Part I.—Inspection and Demonstration at the East London Water Works, Lea Bridge, Clapton, at 3 p.m., conducted by Mr. W. B. Bryan M.I.C.E.

Thursday, March 28.

GLASGOW INSTITUTE OF ARCHITECTS.—General Meeting at 2 p.m.

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part I.—Professor Henry Robinson, M.I.C.E., on "Scavenging, Disposal of House Refuse," 7 p.m.

ROYAL INSTITUTION.—Sir Wyke Bayliss on "Shakespeare in Relation to his Contemporaries in Art."—II., 3 p.m.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—First Conversazione at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly.

INSTITUTION OF ELECTRICAL ENGINEERS.—Meeting at 8 p.m.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

MARCH 20, 1901.
No. CCCXX.

EFFINGHAM HOUSE,
ARUNDEL STREET,
STRAND, W.C.

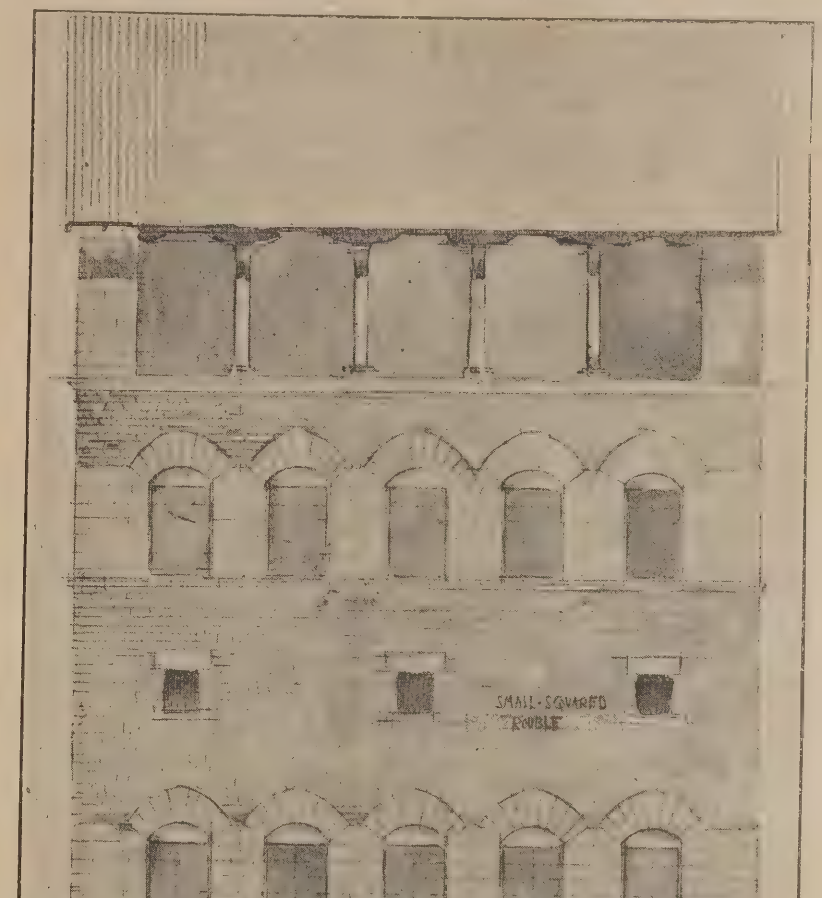
OUR NEW SERIES.

As we announced in our last issue, the "Builders' Journal" is to be raised in price from 1d. to 2d., the new series beginning with our next issue. It will no doubt interest our readers to know that the leading feature of this issue will be a fully-illustrated article on the work of Mr. E. Guy Dawber, F.R.I.B.A.

An Architectural Causerie.

Queen Victoria Memorial. IT is of course impossible to please everyone, and no doubt while many will approve the decision of the special committee to erect the Queen Victoria memorial in front of Buckingham Palace, others will think differently. For our own part we do not consider the site to be altogether a happy one, though we appreciate the difficulty of naming a better one—it would perhaps have been more satisfactory, as we have already suggested, to erect the memorial in Parliament Square, after clearing away those ill-placed statues of celebrated statesmen. However, the Buckingham Palace site has been decided on, for better or worse, and the next matter to which attention is directed is the memorial itself. What form shall it take? And here we meet with a mass of conflicting opinion. It does not appear to us to be at all desirable to incorporate the memorial with the palace front, which (if we might use the expression) would be like putting "new wine into old bottles." It has not yet been stated whether the memorial, if a disconnected work, is proposed to be placed inside the railings or outside. The battle of the styles has lost its fierceness, but there is enough zeal left to ensure a lively discussion about the "style" of the memorial. Shall it be a Classic or a Gothic work, or a creation of the new school of architects? If it is to be attached to or immediately in front of Buckingham Palace, Classic design will become imperative, though if it were more on the Mall Gothic might be adopted. We certainly think that in this matter an imperial competition among British architects should be held, and it is most ardently to be hoped that the memorial will embody the three great arts. At the present time the work done by certain of our sculptors and painters—the younger men—is worthy of the highest praise, and it should receive a prominent place in the great monument to our late revered Queen. One sign is particularly satisfactory. It seems that before deciding in any detail on the style of the memorial the committee intend to ascertain the amount of money that will be forthcoming. We do not desire a repetition of the Albert Memorial, where the gold was plastered on in order to use up funds which had to be spent, though no provision for them had been made at the outset. We believe that half a million of money will be subscribed by the British people, and such a sum ought to be used in the very best possible way. A chance offers itself now for our architects, sculptors and painters to erect a very great memorial, one which posterity will cherish. Will they rise to the occasion?

Rural By-laws. THOSE whose have had experience of the unnecessarily onerous by-laws imposed on the building of houses in the country will read with interest the account (on page 140) of the deputation of eight gentleman appointed by the Royal Institute of British Architects to wait on Mr. Grant Lawson, parliamentary secretary to the Local Government Board. The fact that by-laws appropriate to city dwellings are made applicable to country houses, where the same risks and conditions do not obtain, is sufficiently well known to need no lengthy comment. It is quite an indefensible state of things. For example, the requirements as to fireproof construction are both foolish and unjust. The Institute stated "that a complete and efficient by-law as to party-walls would sufficiently protect each individual from the danger of fire from his neighbour's premises in country places, in uncrowded districts, and wherever streets are laid out with the width and spaces required by the by-laws": and their scheme is for the Local Government Board to arrange their Model By-laws in divisions, and sanction in each district only such as are really needed. The Local Government Board, we are glad to see, recognise that their by-laws ought to be revised, and a Bill will be introduced into Parliament with this object in view. Country builders would then be relieved of several of these most objectionable restrictions and impositions.



PALACE DAVANZATI, FLORENCE. DRAWN BY PERCY E. NOBBS.

WHY GO WE TO ITALY?*

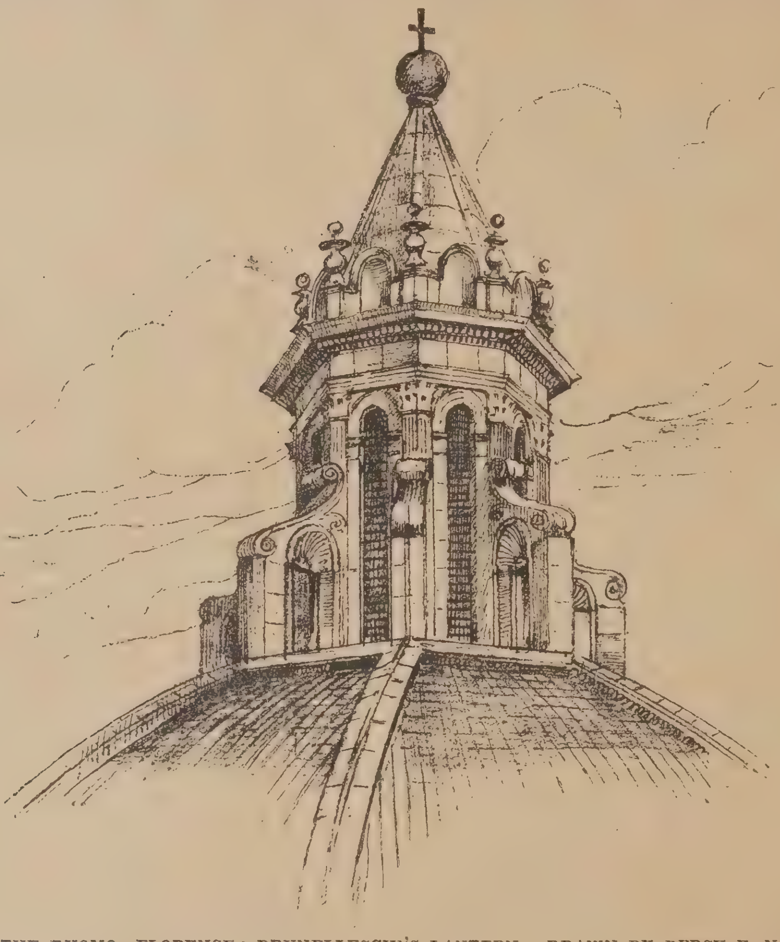
BY PERCY E. NOBBS, M.A.

HAVING had the good fortune last autumn to travel in North Italy for the study of the architecture and decoration there to be found, we feel we cannot do better than put our remarks in the form of an answer to the question, "What went we out for to see?" This treatment of our subject was suggested immediately on our arrival there by the fact that everything was so different from what we had expected. We had imbibed the idea that the land was full of good architecture and that fine taste was an instinct of the people. We found the good mixed with the bad in just the same proportion as elsewhere—gems here and there, usually in unexpected corners, buried in a mass of the most utterly futile, insincere and vulgar rubbishry which depraved taste has ever produced; and our chagrin is not lessened by the fact that good and bad alike are usually very well executed. Our disappointment was rather due to the popular prejudice in favour of the Italians as a nation of artists than to their natural delinquencies. Moreover, we shall touch as lightly as may be on these enormities and confine ourselves to the many phases of superlatively good work we were privileged to see. And when a gem of Italian art is at last unearthed it is well worth the hundred and one difficulties that bar the way of the seeker. These difficulties, we hasten to explain lest we be thought guilty of discouraging travel in Italy, become gradually less as the wanderer becomes more fluent in the language, more used to the ways of Italian officialdom, more inured to the pain of parting with the coin of the realm at every turn, and more habituated to the everlasting delays which the formula "Si, signor, subito" ("Yes, sir, directly") always seems to herald.

But we are getting too general. Our object is to show that Italy is not just what we and possibly others equally exposed to popular prejudice may have thought it was, but that it is the best place for us to go to (after doing our own islands) nevertheless; and as a side issue we shall argue that the architectural work we would study there is not typical of the Italian character, but the work of exceptional men.

Our route lay through Milan, Verona, Venice, Ravenna and Florence, and many smaller places were touched on the way. As work of all periods occurs in nearly every town we shall abandon any attempt at historical sequence in dealing with what we have seen, and shall take things up pretty much in the order in which we have found them.

It is not to be supposed that the foundations of the Italian character to-day are very different from what they were in the thirteenth century. The keynote seems to be a faculty for drowsily existing when not roused and for living at double the rate of the northerner when enthusiasm or interest is stimulated. Your Italian lacks mental stability and seems incapable of acting except directly in response to external stimulus, but then he is like new opened champagne—neither to hold nor to bind—he is all feeling, life, energy. But "self-reverence, self-knowledge, self-control"—these three he knows not.



THE DUOMO, FLORENCE: BRUNELLESCHI'S LANTERN. DRAWN BY PERCY E. NOBBS.

Now Italian art as a whole is the fruit of the live active side of Italian character; in his other state he is incapable of doing anything well enough to be called by that sacred name. All his conscious subtlety and judgment, however, seems confined to his semi-conscious state. When aroused the furnace of his imagination begins to glow and the light of his reason pales before the holocaust of his passion. If roused to admiration, he praises till the gods should blush; if to hate, blood alone will satisfy him. So in art, he is ever prone to overdo the matter he has in hand. Blessed with eyes and hands which as instruments are well-nigh perfect, your Italian as a rule lacks the mental qualities without which the most subtle appreciation of form can lead to naught. No, the Italians are not a nation of artists, and probably never were. And all the great architects of the Renaissance were eminently gifted with very intuitive qualities of mind.

Before answering our main question, "Why go we to Italy?" it may be well to touch on what constitutes the architectural pabulum which the student would fain find and digest. When travelling for study there is a pretty constant strain on the critical faculties. We all agree that there is no use wasting time and energy studying bad work. To define it is not an easy matter, however; what goes into that category depends largely on personal taste and training; still there is in art as elsewhere a distinction between good and bad, and it has already been hinted that Italy is particularly well provided with examples to which the latter epithet is applicable. Moreover, Italy is peculiarly rich in objects of mere antiquarian or historical interest, which are thus, as it were, hoisted up on a pedestal before us. In ninety-nine cases out of a hundred the artistic qualities of such objects are vastly overrated. To the man about to travel in Italy we would say "Beware! take these things for what they are worth; weigh their beauty in the balance of your reason and ignore the other interest, except it attach to the personality of the artist." True, the why and wherefore of a thing often depend on its history; but in Italy circumstantial and accidental historical interest of dubious origin is very apt to give undue prominence to inferior work, and it is the charm of Italy that there is plenty of good work in out-of-the-way corners quite unexploited or written up. Long may it lie hid to give zest to the otherwise very weary labour of an architectural tour.

Of course the first phase of Italian work with which we came in contact was the semi-domestic modern style in vogue in the hotels. Here the plague of feigned mouldings first assailed our eyes, and after suffering many shocks and a few take-ins we came to the conclusion that there were no two ways about the cleverness of the execution or the wickedness of the perpetrators. We take this opportunity of denying that the Italian school of feigned architectural ornamentation has any claim to be regarded as decorative art. We have often been deluded by its cleverness and shocked by its daring, and we have occasionally been sardonically amused by its impertinence, but never have we experienced the faintest gleam of pleasure even from such stupendous efforts as the ceiling in the Church of the Ognisanti at Florence. It is salt that never had any savour.

The Italian tradesmen are rather a puzzle to us. The fashioning of stone, whether marble or coarser material, is invariably good, the rougher dressings often presenting charming textures. In joinery, on the other hand, your Italian is far behind his brethren here. His work in this respect is characterised by slovenly fitting and an utter want of "gumption." Italian plaster work is nearly as debased as Italian decoration. The chief vocation of the plasterer is the imitation of materials superior to those actually in use. To his credit let us add that some of his mixtures seem imperishable and indestructible, but we could not find out the specifications for them for love or money.

To leap back 800 years, the pre-Gothic work of Lombardy and Tuscany—if we may be pardoned for so sudden a shift from the ridiculous to what is often not far short of the sublime—affords us countless examples of a simple arched construction giving most excellent effects, especially internally, where a dignified and spacious solemnity is the rule. Externally impressiveness is due to mass and scale alone, the busy treatment of banded marbles and blind arcading, however picturesque and beautiful in colour, being in many cases exceedingly distracting owing in a measure perhaps to the casual and capricious schemes of proportion. One external treatment of wall faces seems very happy. The wall is banded in two colours in the usual way; a strong plinth or base course and the cornice are connected by pilasters or little buttresses at frequent intervals. These for a 30ft. wall head often do not exceed 6in. in width with a 4in. projection. The banding runs right through the pilasters. Thus we have the horizontal stripe broken by the shadow and perspective of these slim verticals, and when this treatment occurs on an apse of tall proportions, and the sweep of the banding

---

[*] A paper read before the Edinburgh Architectural Society on February 27th, 1901.

and varied angles of the breaks comes into play, one of the most charming effects possible in plain stone masonry is at once obtained.

To pass on a stage, we next deal with the thirteenth and fourteenth century Italian Gothic. My readers are no doubt all aware that in Italy Gothic art as a system of construction never obtained at all. Street, in his famous essay on the thirteenth century in Italy, points out that the only works of this period in Italy possessing architectural qualities were the work of foreigners. Italian Gothic was a mere decorative fashion, and it is not too much to say that wherever ambition is shown failure is proportional thereto. Gothic was evolved by the cool-headed intellectuality of the North. It was a seed designed to thrive in a temperate climate on a firm light soil; beneath the fervid sun of Italy, on clay rich with undecomposed traditions, a rank growth was inevitable—the riot of autumn was in its verdure before the fruit had set. Exquisite detail and thoroughly feeble design are the main characteristics.

A glance at the Cathedral of Milan, or at the way in which the windows of the Duomo at Florence occur regardless of the design of the marble panelled wall facing, will bear out what we mean. Here we have not the accidental charm so frequent in our own Gothic, but deliberate want of consideration—stupidity, and this is characteristic of the Italian architect whenever a departure from the ruled formality of mere façading sets him free. He does not regard a difficulty as a thing to be overcome with grace, but just cuts off an arcade anywhere or botches an awkward angle in a most petulant spirit.

What some Italian Gothic churches do teach us is the beauty of simple but emphatic form. There are at Verona several plain brick churches of the most charming and dignified proportions, externally and internally fine and spacious. The inspiration for St. Agnes, Kennington, by the younger Scott, and for Pendlebury Church, near Manchester, by Mr. Bodley, seems to be derived from this school of work. Simple to a degree in form and detail, their plain brick walls sparingly broken by window openings or stone dressings, and their horizontal massiveness relieved by the repeating shadows of the slim straight buttresses, these churches possess eminently that charm of austere beauty which has its very foundations in sincerity of design and which, alas! so seldom obtains in the sacred buildings of Italy. On the question whether these are works of architecture in the sense that their constructors tried consciously for the effect attained so happily, or merely examples of exteriors left to look after themselves and "turn out," we shall not venture a definite opinion, but we suspect the latter to be the correct surmise. There they rise, these great red churches, sheer up like ships at anchor amid a sea of red roofs, each with its stately campanile guarding it hard by, and above them all the queen of clock towers shoots up into the blue—the Campanile del Municipio, calmly recording the gentle flight of time in spite of the protest of the rushing Adige, for in Verona there is no hurry outside the bosom of the stream. There they stand, whether works of conscious or unpremeditated art it matters not—a sufficient reason, indeed, why all who would build truly and well should hie themselves off to Italy to see them.

We cannot leave Verona without a word on the works by Sanmichele there. Two or three façades, an unfinished tower and the famous gates in the city walls are the chief works he has left his birthplace. These gates are superlatively fine examples of the forcible and stern in building. The great rusticated archways knit their brows not in a savage scowl but in a firm determined frown. The lesser openings, contracted to their minimum, echo in a shriller key the sentiment of the main portal.

Rustication in Italy is invariably more or less roughly dressed—polished rustication, so common and perhaps necessary in our smoky cities, was there all but unknown in the fifteenth and sixteenth centuries, when it was the custom to hammer-dress or leave entirely natural the body of the stone, though the joints were carefully wrought. In fortified work, cubic stones wrought with intersecting bellied rustication showing a saltire mitre are common, and we find entire façades at Ferrara and elsewhere faced in this manner. The most extravagant rustication known is at the Pitti Palace, in the plinth of which blocks occur showing a face of 14ft. by 2ft. 3in., projecting more than 2ft in places. In the work of Sanmichele the blocks are flat on the face and rounded not too finely into the joints, which are executed with great care.

We spoke just now of the campaniles of Verona, and it is an interesting fact showing the power of local traditions in architecture that each district in Italy has its special type of tower, just as at home we find special characteristics in the towers of Warwickshire, Lincolnshire, Northamptonshire, Oxfordshire, and other districts. Round Venice there is one recognised type of which the fine tower of S. Giorgio Maggiore is a good example, varying from the traditional form only in having a circular conical roof and in the heavy sweep outwards above the main cornice. Further west the circular conical roof, composed of bricks semicircular in plan at their exposed ends, is all but universal. Dr. Anderson, as we all know, has adopted this type for his tower at Free St. George's, Edinburgh, with less reason perhaps than did Palladio for S. Giorgio, Venice, but with quite equal success—indeed, we did not see the Edinburgh example excelled anywhere in its native district.

Venice has many lessons for us in spite of the altogether unique conditions there prevailing. Much of Palladio's best work faces on her canals, and as English seventeenth-century work owes so much to this master, the study of his dignified, restrained, but somewhat frigid manner must help us to understand our own developments on these lines. Many of his Venetian façades are experimental, and of these not a few are failures. The problem which seemed to trouble him was the mingling of a main and subsidiary order for doors, &c., in the same style. This is beautifully solved in the case of the nave arcade of S. Giorgio Maggiore, where the main order is on a pedestal. Note in the accompanying sketch the way in which the base of the lesser order and the plinth mould of the pedestal combine. Here the question is, of course, complicated by the arcading. In some cases the lesser order is elevated on a podium and sometimes the bases of both line, but there are objections to both practices. Into the many dodges or "'cute fakements" of this master we cannot now enter. They can only be studied with profit in position, and thus we have another excellent reason for going on pilgrimage beyond the Alps

On St. Mark's we shall not dwell at any length, because, in a practical sense, it is useless to English architects. We are of those, however, who hold that the study of a theme has educational value inversely as it possesses practical utility. St. Mark's is for us a place in which to sit down and look, and the more we ook the less are we inclined to rise and go. Few interiors can so whet the appetite for their own consumption. Gorgeous, rich and sombre, it is rather picturesque than beautiful, being eminently formless, and hence, perhaps, its mystery. As architecture, it is big with the bigness, not of the vast, but of the clumsy, and we can see little thought in its conception as a building; but this is amply compensated for by the pains lavished on the wall-covering of marble veneers and storied mosaics. But Ruskin has told it all as well as it ever will be told, so we will out into the sun and see the outside. Here the restored mosaics set the teeth on edge with their vulgar debauch of colour. There is much excellent marble veneer, so that the beauty of the material provides a perfect feast for the eye, happily distracting the attention from a critical study of the architecture. We fully acknowledge that when colour is introduced into architecture form must play a less important part in the composition; but this should be in the nature of simplification, not a general deterioration of proportions as here exemplified. In Byzantine work we usually find the above principle accepted and acted on. Great wall surfaces are provided for marble or mosaic decoration. Mouldings almost vanish from the work, occasional small strings chamfered and enriched with a block, or a running pattern sunk in the face, being all that here represents the most potent means for architectural effect, after the proportioning of parts, in the more sombre styles. This general formlessness, however, which is necessary when materials of great intrinsic beauty are employed, is in no way incompatible with the fine proportioning of the structure, which is behind all surface things the soul of architectural design, and of which we have excellent proof in the lesser Byzantine churches near Venice at Murano and Torchello.

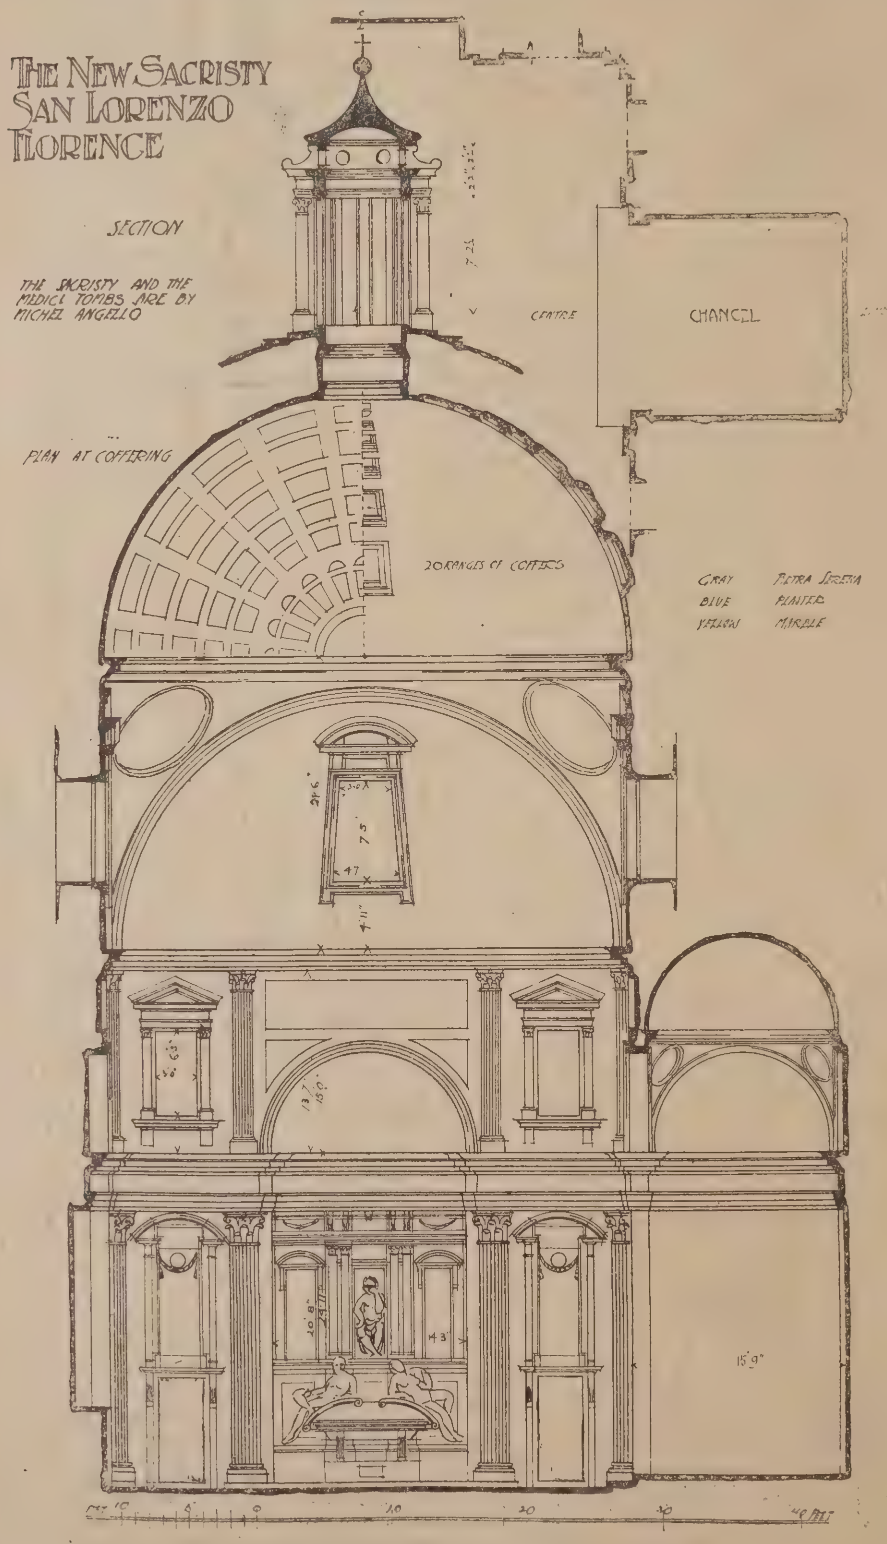
The St. Mark's mosaics, though far inferior in every way to the Ravenna examples from the fifth and sixth centuries, are most worthy of study as a decorative scheme. The arrises where arches or groins occur are always bull-nosed, the mosaics being carried smoothly round; the form of the vaults is only sometimes emphasised with borders or running patterns; usually the gold cubes are carried round the bull-nose and reflect more or less light from all points to all points, and so a soft gleam of radiance shows where soffit and pendentive coincide.

It is impossible to refer to Italian mosaics without lodging as strong a protest as possible against the wholesale reconstruction of these invaluable examples of a unique and glorious phase of decorative art at Ravenna. The procedure of the restorers now at work is to knock down the old work and re-execute the designs as far as may be in new glass (drawing on their imaginations where gaps occur). The work is certainly being well done by capable artists, but such restoration destroys the authenticity entirely. Moreover the old cubes were often very small and have a mellowness not possessed by the new ones. The restorers assure us that they are matching the original colour of these weathered cubes: perhaps they are—we prefer the weathered tints, and the use of larger cubes has only rapidity of reconstruction to commend it.

Passing now to Florence—the most beautiful town in the world and the birthplace of modern architecture—the student feels himself at once face to face with a big personality—Brunelleschi. His lesser works meet us on all sides testifying to his industry, and his great dome pervades the whole city, yes, and the hills around. Go where you will in Florence it is ever within your ken. From the Fiesole road or any of the heights, from up the river or from down the river, it is ever the centre of interest in the enchanting scene on which we have had the privilege to gaze. There are other great domes in Florence, but mere pigmies by the side of this serene giant. Tall and straight beside it Giotto's Tower soars into the bright clear air, beautiful as a slim girl is beautiful, and trivial a little, yet losing nothing by comparison but rather gaining by contrast with the vast dome behind—the two serving but to accentuate, on the one hand, grace, and on the other, grandeur. Suppose we walk to the Piazza del Duomo from the cypress-lined vista whence we saw it just now, across the vineyards and olive gardens all russet and dusky in their winter dress. As we enter the town the great dome shows at intervals when the narrowing streets point that way, rising, ever rising, above the nearing roofs and chimneys, till at last we see it at the end of a straight street blocking out the very sky, and the eaves of the tall houses and grim palazzi in steep perspective point little above the basemould of the mighty pile.

And now the glorious colour of the tiles begins to tell in all its mellow charm—dull flushing red lined with long weather stains—and the sweeping curves are crisply shown on the angles where the eight great marble ribs converge to bear the dainty lantern now gleaming pink in the waning light.

At last a man in whom the native enthusiasm was tempered by a balanced intellect had sprung up among Italian builders. In his work there is more of a great individuality than



MEASURED AND DRAWN BY PERCY E. NOBBS.

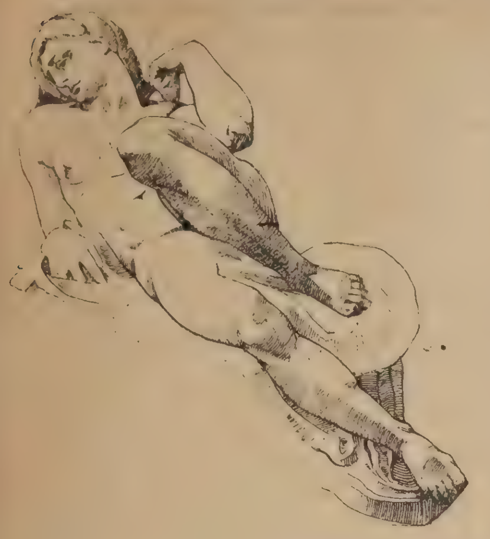


FIGURE OF DAWN, MEDICI TOMBS, FLORENCE.

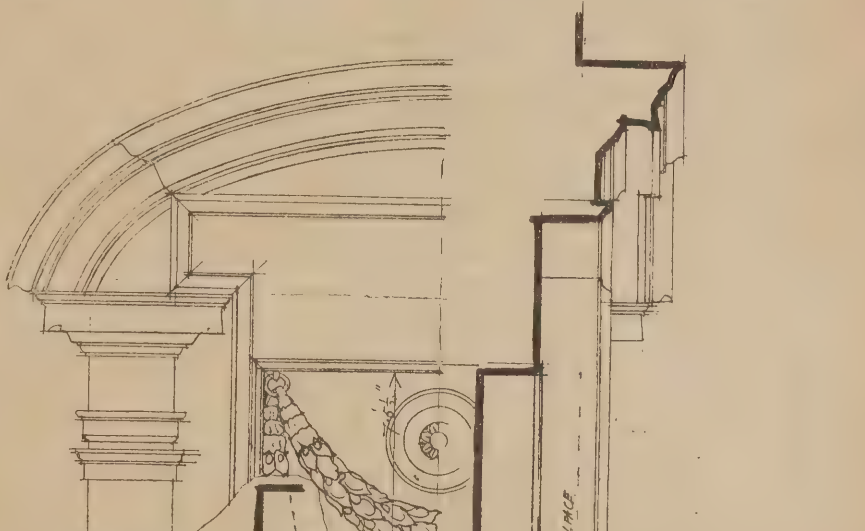
of the classic traditions he studied with such loving care. The first great modern exponent of style, in the real, live personal sense, independent of conventions and manners, in which Viollet-le-Duc so rightly understands the term, had arisen, and the practice of modern architecture as a profession and an art became assured.

Over and over again does Brunelleschi show us (most notably perhaps in the church of the Badia at Fiesole) that perfect architecture can be composed independent of coloured marble or carved ornament; yet, when so minded, with what taste and judgment does he apply his decorations and what exquisite beauty of design and execution does he attain in them! Ornament was undoubtedly the pitfall of the Italian architects, and it is hardly too much to say that more buildings were spoiled than improved by embellishments in themselves most beautiful. As ornamentalists the men of the Cinquecento or sixteenth century were supreme, and the study of this charming school of work is to-day the main attraction for the student of architecture in his pilgrimage to Italy. The best work of this style was really done from 1470–1500, and when we say it reaches the same high level attained by English work in that brief period of perfection, 1300-1370, there is nothing left to be said in its praise. Mina da Fiesole was, perhaps, the most famous stone carver of the period, but when we remember that those versatile artists, Donatello, Brunelleschi himself, Ghiberti, and Andrea della Robbia, were all decorative sculptors, we can appreciate the reasons for the general excellence. We are all familiar with this type of ornament—our schools are full of it (often to the exclusion of other equally worthy things), but what we wish to insist on is the need to see these things where they grew, in the "pietra serena," or creamy marbles, that gave them birth. Thus to have seen and felt the beauties of a bygone style must ever impress on the mind a standard of excellence, unsurpassable indeed, yet to which it is possible to attain in the work of to-day, even without imitating the phenomena in question. Beauty in ornament depends on the spirit, the imagination, and the execution of the work, and is not monopolised by any one school; yet nowhere in the world are these qualities to be found in stronger essence than among the tombs, pulpits, galleries, portals and fountains which grow in as natural profusion in the sombre aisles of Italian churches as do the vine and olive on the terraced hillside or the plain beyond the city wall.

The old street architecture of Italian cities is always picturesque and charming, and every town has its own types and idiosyncrasies. Some of the brick palazzi of Ferrara with strong bold terra-cotta cornices and entrance doors, emphasised with some daring play of archway column and cornice, seem to evidence the limit of dignity obtainable in what must ever be regarded as a material inferior to stone for monumental expression. The Florentine examples possess a yet finer type of dignity, though the scale frequently suffers from the size of the blocks and the enormous proportions of the storeys. The Strozzi, Riccardi, Ruccillai, and Pitti palaces, of which it is superfluous for us to carol the praises, do not represent the vernacular architecture, being examples of exaggeration of the local manner of their time affected by architects very consciously and very successfully striving after effect.

We have in the accompanying rough elevation sketch of the Palace Davanzati a far more typical example. The great dignity of this façade depends on the extremely simple architecture, which gives full prominence to the proportions and the charming textures of the masonry, the variety of which seems to tempt the eye to explore each surface, with the result that the bigness of the thing becomes very apparent. That, we take it, is the latent power in the various kinds of rubble and ashlar facework which we are only too often accustomed to specify without any regard for their scale-giving natures when rightly employed. The various dressings are noted on the sketch. The severity of the scheme is relieved, while at the same time the monumental effect is heightened, by the enormous cartouch on the first storey, which is near enough to the passer-by to be readily compared with the human unit of scale. Had it occurred at the top of the building it would lack this faculty of linking the bigness of the whole with the smallness of the creature that built it. But this is only one of many Florentine examples of simple buildings adorned by the light of pure reason and subtle proportioning, and absolutely innocent of constructed adornments and the four blessed orders, and, best of all, entailing no fraud on the beholder. How many modern street fronts could plead not guilty on this last count? There are probably no streets in the world where one can better study the inherent beauties of stone construction than in the shady lanes of Florence; and how it comes about that the same breed of men who built these honest old walls came to be responsible for such extreme crudities as some of the church façades of the same town evince passes our comprehension. The Italian character has always shown itself capable of splendid infamy—perhaps this is the architectural statement of the same fact.

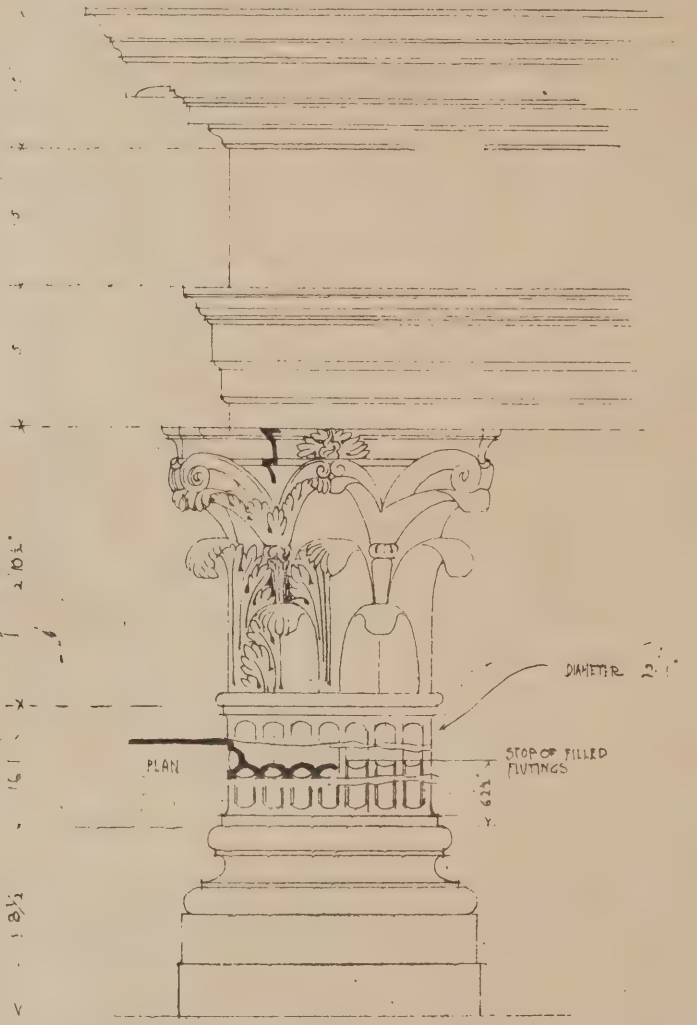
The Renaissance in Italy, as far as the architect is concerned with it, culminates in the wonderful works of Michel Angelo, and though well aware that it is an impertinence to attempt to say anything about so great an artist in the few moments at our disposal, we feel these notes would be very imperfect without a word about so potential a force in art since his day to ours and on through the ages to come. It not infrequently happens, in other walks of life besides the practice of the arts, that a very great exponent may exercise a prejudicial influence on his branch of human activity by exciting the emulation of less capable followers in schemes too daring for



THE NEW SACRISTY OF SAN LORENZO, FLORENCE: MICHEL ANGELO'S DOORS.

their powers. Such we reluctantly pronounce the influence of Michel Angelo to have been. To consider one of his works—the new sacristy of San Lorenzo. It is here that the Medici tombs stand mutely eloquent to the public of the glory of the Medici—to the student of perfect skill—no! we hold the truth is quite other—to the public they proclaim the glory of Michel Angelo's cunning, and to the other section of mankind the shadow of the rock on which civilised taste was wrecked.

The sacristy itself affords an example of fine simple classic detail in "pietra serena," the "non-architecturalised" portions of the walls being plain white plaster. The domed interioe is of very tall proportions, there being onn order or storey more than is usually found is buildings of its class. The acoustic propertier of the place are terrible. The whole interior struck us as so interesting that we measured it up as the surest way to come to any conclusions on its merits. So far there is nothing extraordinary, but the virile quality of the detail makes it well worth the trouble of reaching.



THE NEW SACRISTY OF SAN LORENZO, FLORENCE: THE MAIN ORDER.

There are eight doors to the floor of the building, six of which we suspect of never having been opened; all are architecturally treated with a square-headed niche above enclosed in a curved pediment in white marble. The proportion of these highly-organised features is altogether excellent, and the detail and execution quite irreproachable; but is the interior one whit the better for having eight of them? This part dates with the building, 1523-29; the tombs were not placed till about fifteen years later. There is, moreover, ample internal evidence in the detail to suggest several years between the design of these doorways and the screens behind the statuary of the tombs.

We must say at the outset that in all the realm of art, detail containing more exquisite enrichments has never been designed or executed. In the profiles we see nothing worthy of imitation—the familiar classic forms have all been strained and improved upon in a spirit so adroit that the plotting of the actual sections causes a shock—they are so very unlike what they look. We had frequently heard this architectural background damned with faint praise here at home, and concluded it was unimportant. This was quite a misconception. The quality of the execution and extreme originality and cunning of design show that the master was doing his utmost—the architecture was no mere adjunct of the memorial—it was in its way as laborious in execution and as full of intellect as the superb statuary which ranks with any sculpture in the world. The only solution we have to offer is that as an architect Michel Angelo was an amateur. His great powers as painter and sculptor gave him architectural opportunities to which he was not capable of rising, though no mean exponent of ours, the mother art. We have in him the Italian character aggravated by the energy and power of a giant evincing itself in a genius nor merely impatient of, but incompatible with, the idea of restraint—and was good architecture ever produced where restraint had no place?

In these architectural backgrounds the triviality of the scale, which constitutes their worst fault after the artificiality of the design has been admitted, may perhaps be accounted for as a conscious attempt to add scale to the sculpture Be this as it may, we feel their effect as a whole to be unfortunate, and the importance we have given to this conclusion is justified by the very pretentious nature of the work; we repeat it was meant to be the best up to its date.

We had not the good fortune to see Rome, and so will not express an opinion on the legitimacy of the scheme in the Sistine Chapel. Of the terrible effect on architecture of this venture no one who has travelled in Italy can be in doubt. We suspect the scheme was embarked upon to show the power of the artist rather than in a proper spirit of decoration. The next generation seem to have treated the work of decoration in a still lighter vein—as an amusement. Feigned architecture is now the traditional decoration of the Italians, and no words can convey the baseness of the architecture so feigned or the puerile silliness of its application.

In conclusion, then, we hope that good reason has been shown why the Italian tour should be undertaken in spite of the general strictures we have felt compelled to pass on Italian taste both of to-day and of the great periods of the past. Apart from the mere development of critical faculty and judgment which the seeing of great quantities of architectural or any kind of work must engender, modern architecture can best be understood by knowing how it grew—and it was in Italy that this took place. Here a couple of streets will often show us far more clearly than any couple of volumes could how men began to build for effect combined with use how they went on to build for effect only; how grandeur first real became in a few generations grandeur merely simulated; how designers tried to be funny in the days of the rococo, and how they have ended by being only vulgar at the close of the nineteenth century.

Apart from thus having the pages of architectural history unrolled in living stone before us (and especially those interesting pages of the fifteenth and sixteenth centuries which are the key to all that happened since, excepting the Gothic Revival)—apart from this we have in Italian work of every century carving and decoration of a standard never excelled, and equalled elsewhere only for brief bright periods. Never before did we realise how little decoration and architecture had to do with each other. The finest Italian architecture is devoid, or almost devoid, of embellishment, and we are forced to the conclusion that great excellence in decoration militates against architectural design either in a nation or an individual. We do not mean to suggest that great beauty of ornament is incompatible with good architecture in any way, but when they are combined—as they have only been on rare occasions (when we look at things in their true proportion and think how little wheat there is among the chaff in the cities of this world)—when they are combined the result has been so astonishing that the whole world recognises it. Italian ornament is a matter so fascinating that it is positively difficult to restrain the temptation to go and do likewise for the sake of its very sweetness. But if it is to do us a whit of good it must be studied in spirit as well as be put down on paper; and such is its subtlety and delicacy, so dainty and magical its use, that we promise the brains and eyes and fingers of the happy students of next year a rare treat. As we find it in plaster in our museums it is only the eyes and fingers that have any good of it—these things must be seen in position.

A new Church at Foulridge is to be erected at a cost of over £5,000.

A Rowton House in Italy.—A deputation from Milan came to this country some time ago for the purpose of inspecting the Rowton Houses in London. They were furnished by Lord Rowton and Sir Richard Farrant, the managing director of Rowton Houses (Limited), with full details of the construction and working of the company's houses. A limited liability company (Societa Anonyma) was shortly afterwards formed in Milan under the title of "Alberghi Populari" to "erect and carry on hotels for persons of small means similar in all respects to the Rowton Houses of London." This company has just completed the erection of one of these houses, containing 600 rooms, in the centre of the city of Milan, at a cost of over a million lire (£40,000). Not only have the details of construction of the London houses been adopted, but the fittings and furniture are precisely similar. The house will be opened in the course of the next few days, and will be managed upon English lines. The price to be charged will be 50 centesimi per night, or three lire and a half weekly, as compared with 6d. and 3s. 6d. respectively here.

DILAPIDATIONS.[*]

By W. J. JENNINGS, F.S.I.

THE subject of this paper may be thought to come more within the province of the surveyor than the architect, and, doubtless, strictly speaking, this is so, but to many country members of this Society the various, and in many cases, intricate questions arising in the relation of landlord and tenant have to be dealt with in the ordinary every-day practice; so that a paper may be of some practical use.

That the subject is worthy the consideration of architects may be inferred from the fact that as long ago as 1842 a Committee of the Royal Institute of British Architects was appointed "to investigate and report upon the practice in valuing dilapidations and on the state of the law by which such valuations were affected," and although many legal decisions bearing upon the question have been given in recent years, though many papers have been read at the Surveyors' Institute and many books published by lawyers and surveyors, the report of the Institute Committee contains most useful practical information, and will be found to be of great assistance in acquiring a proper appreciation of the subject.

It must not be expected that within the narrow limits of a paper the subject can be exhaustively dealt with; at the most, some of the matters falling under the head of dilapidations can only be referred to very briefly; and one of the most important divisions of the subject, namely, ecclesiastical dilapidation, will not be touched upon for the reason that the various questions arising under the Ecclesiastical Dilapidations Acts are, by the great importance of the subject, entitled to, and on some future occasion may form, the subject of a separate paper.

It is proposed to discuss shortly the general principles applying to the common law liability to repair, as applied to a tenant for years and a tenant for life, though this might be thought to be more a matter for lawyers than for architects; the greater part of the paper will be devoted to the principles and practice of surveying and valuing dilapidations to buildings arising under the more common forms of covenants entered into by landlord and tenant.

Dilapidation Defined.

Dilapidation is variously defined One of the best definitions from the architect's point of view is that given in the report of the committee appointed by the Institute, previously alluded to; it is there stated that "dilapidations are in usual practice considered to be those defects only which have arisen from neglect or misuse, and not to extend to such as only indicate age so long as the efficiency of the part still remains; but if the effects of use or age have proceeded so far as to destroy the part, or its efficiency in the structure, this argues neglect or misuse, it being the presumption that at the commencement of the term the tenant was satisfied that every part was sufficiently strong to last to its close."

Dilapidations arise from waste, either voluntary, permissive or malicious, the term "waste" being thus defined by "Grady": "Whenever there is a particular estate in lands or tenements which must, after the determination of such estate, devolve upon another, any defect in their condition is properly dilapidation, and the act of permitting or committing such defect is called waste."

It is necessary to consider "waste" in some detail and to refer to the principal divisions which are, as stated above, voluntary, permissive, equitable or malicious. There is also ameliorating waste, as to which the architect is not often troubled. Of these the first two divisions, *i.e.* voluntary and permissive waste, are of great practical importance to the architect, being the kinds most prolific in disputes.

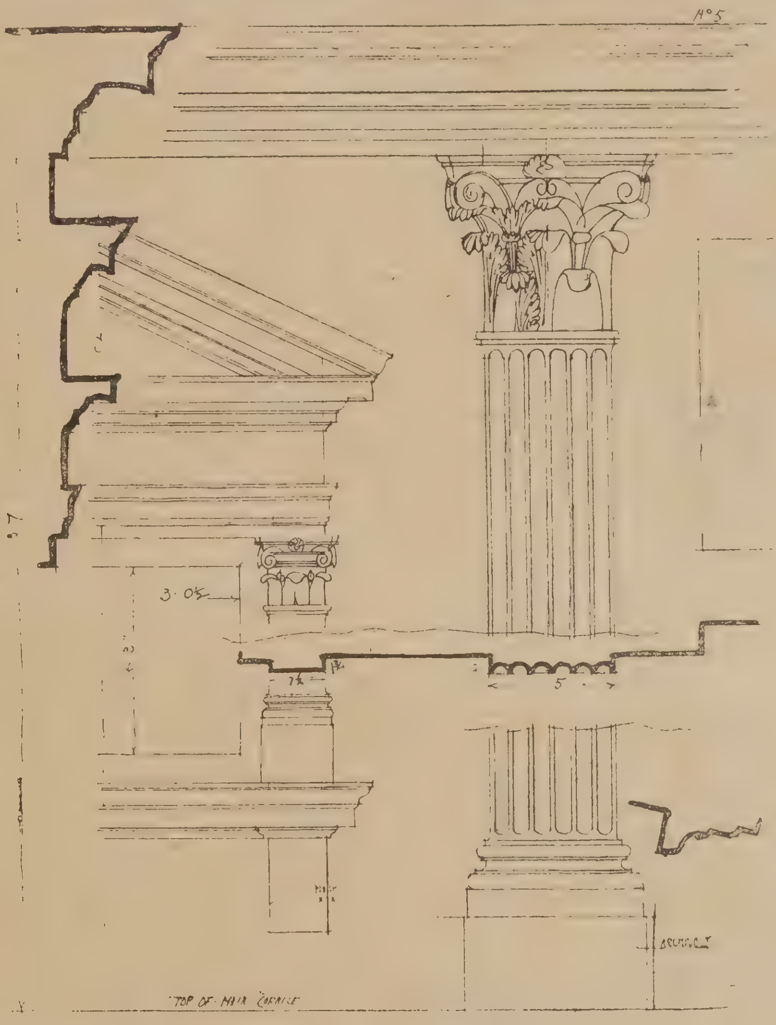
The Four Chief Kinds of Waste.

Voluntary waste is actual or commissive, as by felling timber, pulling down buildings or altering their structure, removing wainscoting or other things once fixed to the freehold, opening mines or pits—in fact whatever does a lasting damage to the freehold or inheritance, the kind of damage that is sometimes provided against by express stipulation in the lease, such, for instance, as not to convert a house into a shop.

Permissive waste is a matter of negligence and omission only, as by allowing a building to fall or rot for want of necessary reparations—the kind of damage which, under a lease, is invariably provided against by express agreement to repair.

Equitable or malicious waste consists in acts of gross damage, usually the cutting down of ornamental timber by a tenant without impeachment of waste.

Ameliorating waste is such voluntary waste as improves the demised premises; such, for instance, as where the tenant puts a new front to his house. In respect to such waste it seems that unless substantial damages be proved the tenant will not be interfered with by injunction.



THE NEW SACRISTY OF SAN LORENZO, FLORENCE: THE SECOND ORDER.

Having considered the meaning of the terms, "dilapidation" and "waste," it is proposed to consider the obligation of landlord and tenant under two heads, namely:—(1) The obligations imposed by the implied covenants under the common law; and (2) The obligations imposed by the repairing covenants in the lease.

Implied Liability to Repair.

First then with regard to the implied legal liability to repair under the common law. Generally speaking, the lessor is under no liability whatever to do repairs. The general principle governing the case is that landlords are not liable to tenants in any way; the burden of repairs has always, by the spirit of the common law, been thrown upon the tenant, for by letting an unfurnished house the lessor does not thereby imply that it is reasonably fit for occupation or that the house will last out the term, or that it will receive proper support, nor is the landlord bound to rebuild in case of fire, though the rent would still be payable. Where, however, the premises become subject to a structural defect, such as the drains, which may give rise to a nuisance or be dangerous or injurious to health. the tenant may, if the steps directed by the Public Health Act be taken, throw the liability for this repair or removal (in the absence of any agreement relating to the matter) upon the landlord. There is an exception to the rule that the lessor is under no liability to a tenant in the case of small tenements, for under the provisions of the Housing of the Working Classes Act (53 & 54 Vic., c. 70) a warranty that the tenement is reasonably fit for habitation is implied in the case of tenements let to members of the working classes at rents varying according to the locality; thus in London the rent must not exceed £20, in Liverpool £13, in Manchester and Birmingham £10, elsewhere in England £8, in Scotland and Ireland £4; but the landlord may contract out of his liability under this Act, and in practice it is found that he generally does so.

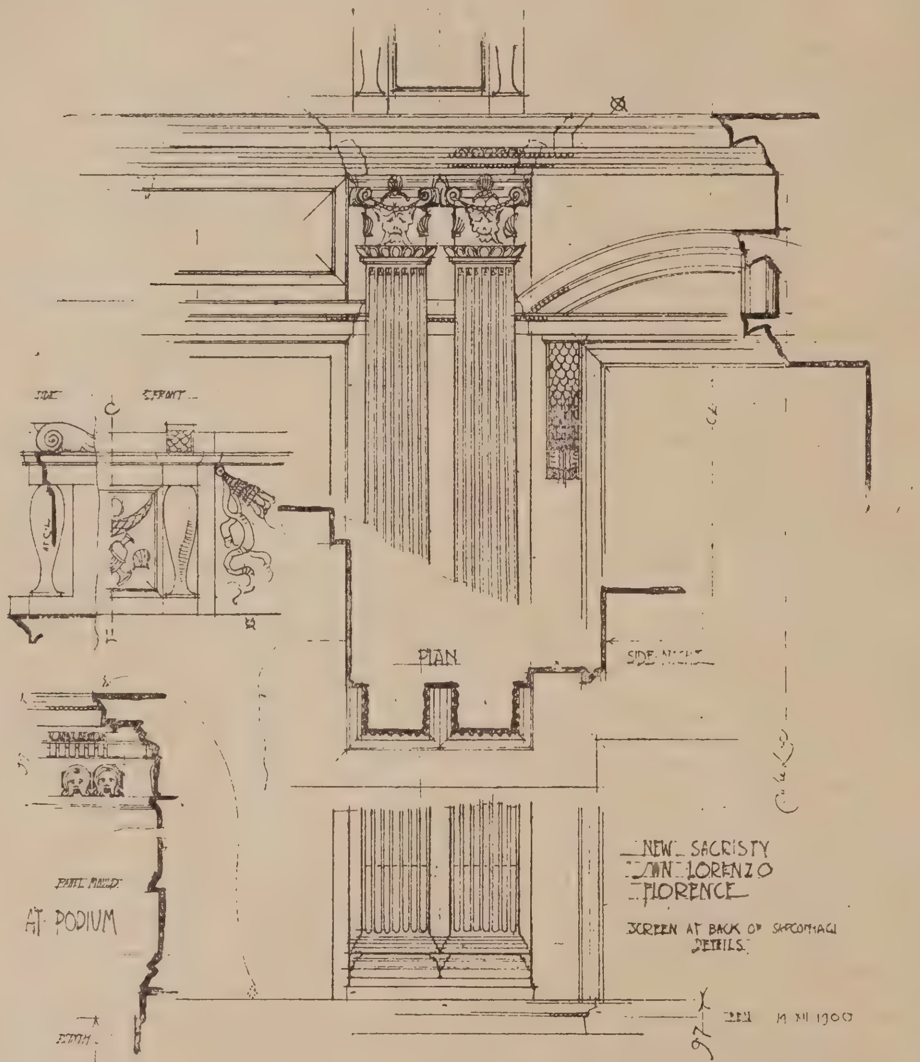
It often happens that during a tenancy the drains prove defective, possibly causing illness, expense and death, but if the landlord has given no undertaking in the form of a guarantee that the sanitary arrangements are satisfactory he cannot be called on by the lessee (except as stated above) to put right what is wrong, nor to recompense the tenant for the expense and loss he has sustained. Of course, if a representation has been made that the drains are satisfactory, although the undertaking is not in writing, it may be a different matter and the landlord might be liable, and as, generally speaking, tenants ask about the sanitary arrangements, care should be taken in replying or it may be found that a guarantee can be construed. If the premises are let furnished it is an entirely different matter, for in that case there is an implied covenant on the part of the lessor that the house is in a fit condition for immediate occupation.

---

[*] A paper read before the Society of Architects on March 21st, 1901.

A Leading Case.

One of the leading cases on the implied covenant that a furnished house is fit for immediate occupation is that of *Wilson and Another* v. *Finch-Hatton* (Exchequer Div. 2, 1876-7). In this case the defendant agreed to rent the plaintiff's house for three months from May 7th, but having at the beginning of the tenancy discovered that the house was, owing to defective drainage, unfit for habitation, he refused to occupy it. The plaintiffs immediately set about repairing the drains, and on May 26th tendered the house in a wholesome condition to the defendant, who refused to occupy or to pay rent. The plaintiffs thereupon sued for the rent. It was held that the state of the house at the beginning of the intended tenancy entitled the defendant to rescind the contract and that he was not liable for rent or for use and occupation. The decision in this case is founded on the well-known case of *Smith* v. *Marrable*, generally alluded to as the famous "bug" case, which was decided as long ago as 1843; it decided that it is an implied condition in the letting of a furnished house that it shall be reasonably fit for habitation, and that if it is not so fit the tenant may quit without notice and would be justified in repudiating the tenancy, while if he had incurred loss, he would be entitled to recover damages.



With regard to the implied liability of the tenant under the common law, his responsibility is much greater than that of the landlord. There is the implied covenant to use the premises in a tenant-like manner. In dealing with houses or buildings this obligation resolves itself into one to do repairs of a certain kind, the amount or character of which in the case of leases for years has apparently never been defined with precision, the reason probably being that such instruments almost invariably contain an express covenant which displaces the implied one by the tenant to the same effect.

The Tenant's Liabilities.

It will seem, however, from the authorities that a tenant at will, or a yearly tenant, is bound to keep the premises wind and water tight, but there seems to be considerable doubt in the minds of lawyers as to what this expression really amounts. Woodfall considers that on the whole it is understood that the expression ought to be construed strictly in favour of the tenant, and quotes as an example that the broken glass of windows need not be replaced by new glass, but that the exclusion of wet by boards or other unsightly modes would be sufficient.

In the case of a tenant for years he is liable under the implied covenants for permissive waste, but not for damage by accidental fire. A tenant for life is, in the absence of covenants to the contrary, under no implied liability to repair.

We now pass to the consideration of the second head of the subject, namely, the obligation imposed by covenant.

The distinction as between the common law obligation to repair and the liability as expressed by covenant is thus expressed in Gibbin's work: "The obligation imposed by the covenant to repair differs from the common law obligation against permissive waste in this: The common law obligation is merely to guard the fabric of the building from decay and is not infringed by an external dilapidation unless the fabric is injured in consequence. By the covenant, the tenant is unconditionally bound to repair all dilapidations, whether the fabric of the building is injured or not; injuries to the building caused by inevitable accident are excepted from the common law obligation, but not from the obligation of a general covenant."

In the practice of valuing dilapidations under a repairing covenant the architect has to interpret the words of the covenant and then survey the property and prepare the schedule and claim, and it will be convenient to consider the subject under these two branches.

Repairing Covenants.

For the proper interpretation of the repairing covenants the architects must have some acquaintance with the law upon the subject as laid down in some of the leading decided cases, for it is obvious that without such knowledge it would be impossible to properly advise upon the complicated and difficult cases that occur in practice. It may be urged that it is the duty of the lawyer to define the exact meaning of the words in the lease, and though, doubtless, this is true, yet in practically every case it is found that the lawyer cannot interpret the words of the repairing covenant without the assistance of the architect, unless he is possessed of more technical knowledge than one can reasonably expect a lawyer to possess.

Speaking broadly, the repairing covenant in the lease generally consists of two divisions—(*a*) an undertaking in general terms, (*b*) an undertaking to do certain acts of reparation, such as painting and papering, at specific periods.

With regard to the general undertaking it varies very much. In the more common forms it consists of an undertaking either to "keep and leave the premises in good tenantable repair," or to "keep and leave the premises in substantial repair." There are, of course, innumerable other forms with ill-defined shades of difference, and, of course, reservations may be inserted to protect the lessee, such as "regard being had to the present condition" and "fair wear and tear excepted"; but with these special conditions it is not proposed to deal further than to say that in the former case a most careful note of the state and condition of the premises at the commencement of the tenancy should be made and agreed upon by both lessor and lessee; and with regard to the words "fair wear and tear excepted," if these words are allowed it renders comparatively slight the liability of a tenant who has been careful to use the premises as a careful tenant should.

Necessity for Preliminary Surveys.

In considering repairing covenants for a proposed lease, the first point to be mentioned is the desirability—in fact, the necessity if the tenant is to be properly protected—of making a survey of the premises; for, as previously pointed out, the presumption is that at the commencement of his term the tenant was satisfied that every part was sufficiently strong to last to its close. But how often is it that an architect is instructed to survey before the lease is signed? It is probable that not in one lease in a hundred is an architect retained on behalf of a lessee. It is not until the latter has had a notice served, calling upon him to make good certain dilapidations, or claiming damages in lieu thereof, that he consults his architect. It should be pointed out to a tenant that a preliminary survey is absolutely necessary, when it is remembered that where the lessee covenants to "*keep* and leave the premises in repair" he is bound to *put* them in repair, if at the commencement of the term they require it. *Payne* v. *Hayne* (16 M. & W. 541) decided this point. This view cannot be generally known by tenants, for one is constantly met with the remark by the lessee, after he has been served with a notice, that "the premises are in a better state than when the lease was entered into." It should also be remembered that the measure of damages for want of repairs during the existence of the lease is not necessarily the amount which it will cost to execute the work; for not only is the tenant bound to carry out the repairs necessary, but he is liable in damages if it can be proved that the value of the reversion is lessened. There is a good deal of misconception as to this, but there is no doubt that the architect is justified in preparing the schedule and claim on behalf of the landlord to include, in addition to the repairs, the damage that he estimates the reversion has suffered in consequence of failure to carry out repairs at the right moment. The law holds that the legal measure of damage is not necessarily the amount that would be required to put the premises into repair, but the amount to which the reversion is depreciated in marketable value; an amount which, under different

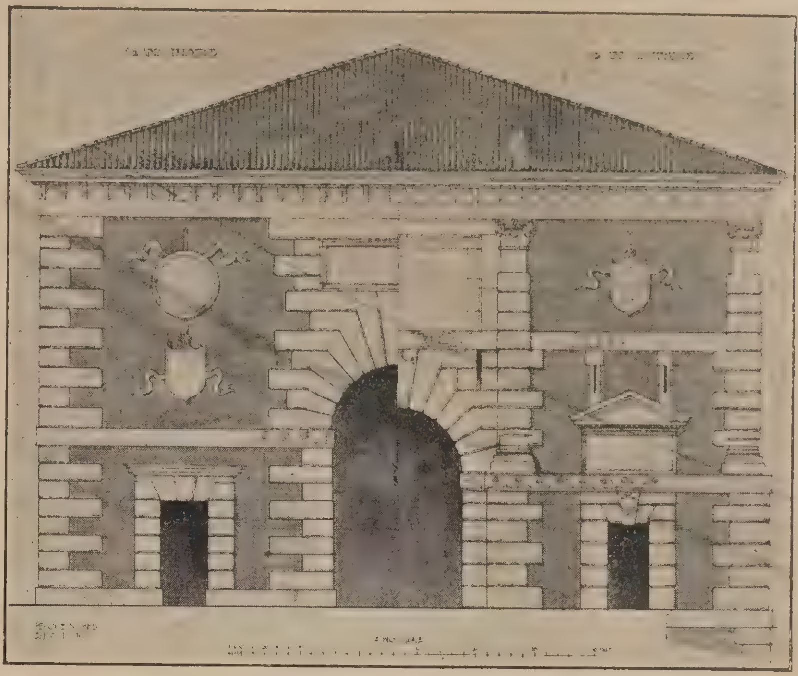
conditions, varies immensely, from merely nominal damages in the case of a lease having many years to run, and increasing more and more the shorter the residue of the term happens to be. To give an instance: Suppose, when making the survey, it is found that a lead gutter has been leaking, maybe for some considerable time; it might and probably would not be a proper measure of the damage to take simply for soldering up the crack, or the renewal of the gutter, since the leakage that has been going on for some time has damaged the gutter-board, bearers and plate, not sufficient to cause actual decay noticeable at the moment of the survey, but enough to have started the woodwork rotting. In addition therefore to making good the lead gutter, the lessor is entitled to be paid something for the depreciation in value of the structure, admittedly a very difficult matter to ascertain, but which the lessor, when the amount is ascertained, is clearly entitled to. The rule for this is laid down in the case of *Williams* v. *Williams* (L. R. 9, C. P. 659).

What is "Good" Tenantable Repair?

As to the covenant to repair, take the case first suggested, namely, where the lessee undertakes "to keep and leave the premises in good tenantable repair." The architect is asked to prepare a schedule of dilapidations to be served upon the tenant for him to carry out, or a claim for a money payment in lieu thereof, and the question arises, what is "good tenantable repair." Previous to 1890, there was considerable difference of opinion as to what was meant by the words, but in that year the case of *Proudfoot* v. *Hart* was tried and a determined effort was made by the judges in the Court of Appeal to deal with the question, and they proceeded to give a definition of the words and to illustrate the application of the principle they laid down. Doubtless the definition given would be considered by the architect better than the practical application of it, but the case is so important that it well repays a careful study. It was a case originally tried before an official referee, who held that the tenant's obligation was to repaper with similar paper to what was on the walls before, and to repaint with similar paint to that which was on the painted portion of the premises. On appeal to a Divisional Court it was held that the official referee was wrong. Mr. Justice Cave stated that tenantable repair extended to commissive waste undoubtedly, and he also thought to permissive waste, and that the tenant must make good the damage exceeding ordinary wear done by his family and servants, but that he must also make good the damage done by other causes—such, for instance, as a casual storm that takes off a slate from the roof or a stone thrown from outside which breaks a window; and if the tenant neglects to do these things, with the result that still further damage is caused to the structure, then he must make good that further damage also, because it comes of his not performing his covenant to do tenantable repairs. With regard to paper and paint, Mr. Justice Cave thought that the tenant could not be bound to repaper or repaint simply because the former paper was worn out and the paint worn off, so long as no damage is done to the walls and woodwork by omitting to paper and paint; also, with regard to whitewashing, if the ceilings as a natural result of tenancy became black the tenant was not liable to whitewash them. So with regard to the walls, the floor, the doors, the windows and all the different parts of the house, he thought the tenant was bound where there was a breakage, whether arising from his own family or from some external accident, to repair it to the best of his ability, but was never bound when a portion of the structure had become absolutely worn out, rendering it necessary to substitute a new structure in place of it. All he thought that the tenant undertook to do was to patch the thing up so long as it was right and reasonable that the thing should be patched up, but when it had reached such a state that patching up was of no avail, then the tenant was not bound to put in anything new or to pay any proportion of the cost of putting in the new thing because the old one had become unfit to discharge its duty.



PORTA SAN ZENO, VERONA, BY SANMICHELE. DRAWN BY PERCY E. NOBBS.

Had this view been successful it would have rendered a tenant's liability under a covenant for tenantable repair even less, or at any rate of not greater value, than it is now with the addition of the words "fair wear and tear excepted;" but when the case came before the Court of Appeal, the judges, without holding that the judgment of either the official referee or the Provisional Court was wrong, adopted the alternative of themselves saying that they did not agree with either, and then proceeded to lay down the principles upon which the case should be decided. The Master of the Rolls (Lord Esher), adopted the definition of Lord Justice Lopes as to good tenantable repair which, he said, meant "such repair as, having regard to the age, character and locality of the house, would make it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it;" and he proceeded to point out that while the question whether the house was or was not in tenantable repair when the tenancy began was immaterial; yet the age of the house is very material with respect to the obligation both to keep and leave the premises in tenantable repair, it being obvious that the obligation is very difficult when the house is fifty years older than when the tenancy began. The age of the house must therefore be taken into account, because nobody could reasonably expect that a house 200 years old should be in the same condition of repair as a house lately built. The character of the house must be taken into account because the same sort of repairs that would be necessary to a palace would be wholly unnecessary to a cottage, and the locality of the house must also be taken into account, because the state of repair necessary to a house in Grosvenor Square would be wholly different from the state of repair necessary for a house in Spitalfields. There is no liability on the part of the lessee to put the house in the same state of repair that it was in when he took it. It need not be put into perfect repair, nor is there any liability to paint and paper, but if the paint and paper is in such a condition that no reasonably-minded person of the class likely to take it would live in it, then the lessee is bound to paint and paper. Again, it does not follow that the painting and papering must be of the same class as at the commencement of the lease. There might be such expensive papers and such decorative paint-work as would be inconsistent with the requirements of the class of persons likely to take the house, and because special painting and papering existed at the commencement of the lease this would not render it incumbent upon the lessee to paint and paper in the same manner. It must not be forgotten that if the premises are out of repair when the lease is entered into, the tenant is bound to put them into good tenantable repair. It is also clear that the tenant must commit no waste.

The definition adopted in this case is an expansion of the definition given in earlier cases, or rather a collocation of all the different parts of the definition to be collected from those cases.

Papering and Painting.

The application in actual practice of the principles laid down by the Master of the Rolls is not so easy as might appear at first sight. It is much easier to speak generally of such repairs as a reasonably-minded tenant of the class likely to take the house in question would be satisfied with, than to say in precise terms what these repairs really are. The Judge allowed himself a very wide latitude in the illustration he gave, for he said: "If when the tenancy ends the paper on the walls is merely in a worse condition than it was when the tenant went in, the mere fact of it being in a worse condition does not impose any obligation on the tenant to repaper. If it is in such a condition that a reasonably-minded tenant of the class likely to take houses in Grosvenor Square (the hypothetical case with which the Judge was dealing) would not think the house unfit for occupation, but suppose the damp had caused the paper to peel off the walls and it was lying upon the floor so that the tenant would think it a disgrace, I should say then that the tenant is bound to put up new paper. The same view applies as to painting. If the painting is in such a state that the woodwork will decay unless it is repainted, it is obvious that the tenant must repaint, but I think that the obligation goes further than that. A house in Spitalfields is never painted in the same way as one in Grosvenor Square; if the tenant leaves the house in Grosvenor Square only good enough for a house in Spitalfields, he has not discharged his obligation; he must paint it in such a way as would satisfy a reasonable tenant taking a house in Grosvenor Square."

There is room for much difference of opinion between the extreme instances suggested in the judgment; there can, of course, be no doubt that when the paper is peeled off the walls and lying upon the floor it would be necessary to repaper, but there is the case constantly arising in practice when the paper has been upon the walls say three or four years and is faded in places and perhaps tarnished in other places. Most new tenants, at any rate for houses of £50 or £60 per annum, would require new paper, also painting long before it has become so bad that the woodwork was decaying; therefore, in deciding upon such repairs as a reasonable tenant would require, there is plenty of scope for the judgment and experience of the architect, and it is more than probable that the judges themselves would have to narrow down considerably for future guidance the application of the principle illustrated in this case.

The Covenant to "Well and Substantially Repair."

To pass to the obligation under the second kind of repairing covenant, namely, that under which a tenant is bound to "well and substantially repair." Great difficulty often arises in the cases of old buildings under a lease granted many years ago containing a general covenant to repair in some such terms as the following: that the lessee shall "well, sufficiently and substantially repair uphold," &c. At the expiration of the lease the tenant may be called upon to carry out such sweeping works as amount practically to rebuilding. Generally the matter is settled by a money payment, but before this can be arrived at it is necessary to say what repairs the tenant is legally liable for under the covenants of the lease, and in arriving at a decision it is very important to consider carefully the age and general condition of the building as it would have been at the commencement of the term, because where an old building is demised and the lessee enters into a covenant for substantial repair it is not meant that the old building is to be restored in a renewed form at the end of the term, nor that it is to be of greater value than it was at the commencement of the term. What the natural operation of time and the elements occasion in diminishing the value constitutes a loss which, so far as it results from time and nature, falls upon the landlord. This was laid down very clearly by C. J. Tindall in *Gutteridge* v. *Maynard* (1 Moad and Rab at p. 336) and this view was adopted in the Court of Appeal in the case of *Lister* v. *Lane* (1893, 2, Q B, 217).

The Case of "Lister v. Lane."

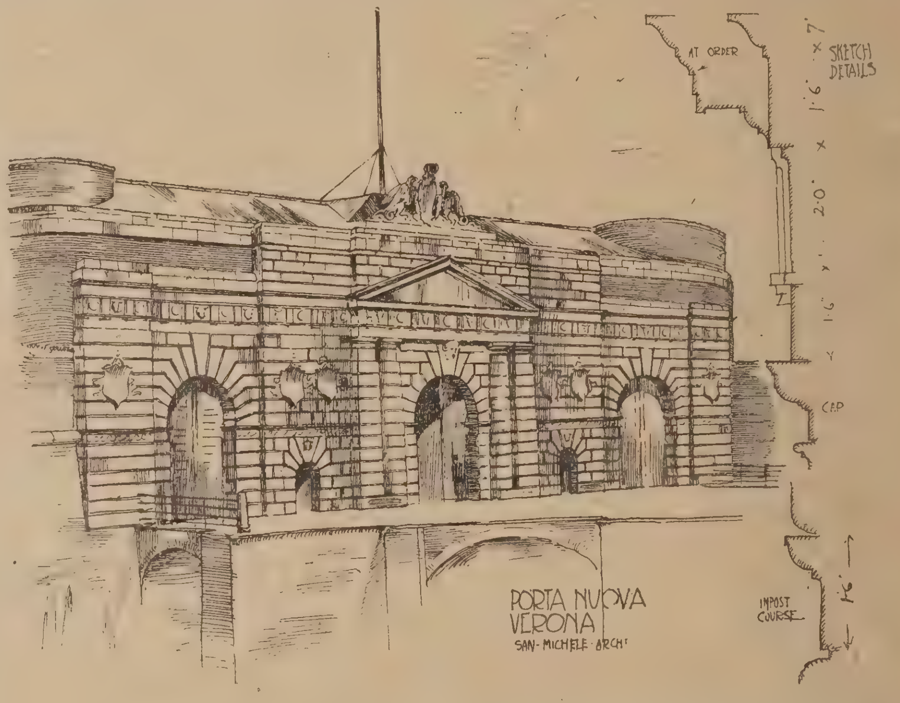
The latter case is so important that a short summary of it may be found useful. It was a lease of a house in Lambeth containing a covenant that the lessees would, when and where and as often as occasion should require, well, sufficiently and substantially repair, uphold, sustain, maintain, amend and keep the demised premises; and the same so well and substantially repaired, upheld, sustained, maintained, amended and kept, and at the end of the term yield up to the lessors. Before the end of the term one of the walls was bulging out, and after the lease had expired the house was condemned as a dangerous structure and was pulled down. The lessors sought to recover from the lessees the cost of rebuilding the house. The house was at least 100 years old, and probably much older; it was built upon a timber platform resting on a boggy or muddy soil, and the bulging of the wall was caused by the rotting of the timber. The solid gravel was 17ft. below the surface of the ground. There was evidence that the wall might have been repaired during the term by means of underpinning. It was held that the defect, having been caused by the natural operation of time and the elements upon a house, the original construction of which was faulty, the lessees were not under their covenant liable to make it good

With regard to the question of underpinning, which it was contended might have been done to prevent the wall bulging, it is to be borne in mind that this would not have been "repairing" the thing that was put in originally, namely, the timber platform, but it would have been something of quite a different character, and this being so there was no liability upon the tenants to carry out underpinning; it was out of the question to repair the timber platform without pulling down the house, and, however large the words of the covenant to repair may be, a covenant to repair is not a covenant to give a different thing to that which the tenant took when he entered into the covenant: he has to repair that which he took, not to make a new and different thing, and, moreover, the nature and condition of the house itself, the result of time upon that state of thing, is not a breach of the covenant to repair.

The Lord Chief Justice in this case said: "You have to look at the condition of the house at the time of the demise, and amongst other things the nature of the house, what kind of a house it is: if it is a timber house the lessee is not bound to repair it by making a brick or a stone house; if it is a house built upon wooden piles in soft ground the lessee is not bound to take them out and put in concrete piles."

Fixtures and Fittings.

It will of course be remembered that all fixtures and fittings belonging to the freehold are subject to the same conditions as regards repairs as the house or building itself, but in practice cases occur where the ownership of the fixtures is disputed. The rule with regard to fixtures used to be much more stringent than it is now. At one time everything affixed to the premises was held to go with the freehold, but this rule has been considerably relaxed by recent decisions. There is a very recent case bearing upon the question of fixtures, which was decided by the Court of Appeal only a month or so ago. It is the case of *Ward* v. *Taylor* in re *De Falbe* (see page 19 of the Builders' Journal for February 13th last), in which Mr. J. Byrne held that some pieces of tapestry which had been affixed by the tenant for life of freehold estates to the walls of the drawing-room of the mansion house passed on her death as fixtures, with the estates, to the persons entitled in remainder. Upon the evidence Mr. Justice Byrne found that the tapestries were fixed on the walls in the following manner: Small strips of wood were fixed on the walls (which in some parts were faced with wood) by means of nails and screws, and over these wooden strips canvas was stretched and nailed; the tapestries were fastened to these strips and over this canvas was fixed by very small tacks, which did not penetrate the wooden strips. After the tapestries were put up white and gold mouldings, made for the purpose, were fixed round the strips of wood by thin wire nails and screws, some of which were long enough to penetrate the face of the wall. The judge held that the tapestries formed an essential feature of the general decoration of the room, and although the ceiling and frieze remained as before, the rest of the walls of the room were altered and redecorated to accord with the tapestries. The judge also held, on the authority of *D'Eyncourt* v. *Gregory* (1866. L.R, 3 Eq 382) and *Norton* v. *Dashwood* (1896 2 Ch. 497), that, having regard to their position, importance and the essential part they played in the decoration of the room, the tapestries had been in effect annexed to the mansion house and passed with it to the remaindermen.



The residuary legatee under the will of the tenant for life appealed.

Lord Justice Rigby, in giving judgment, said that the representative of the tenant for life stood in the same position as the tenant for life herself with regard to the remaindermen. At one time anything whatever affixed to the freehold was held to go with the freehold, and it was only by slow degrees that that unbending rule had been modified. But in later times important exceptions from the rule had been established. One exception entitled a person who had put up fixtures for trade purposes to remove them. That exception was not confined to the case of landlord and tenant, but extended to the case of a tenant for life and remaindermen. Another very important and well-established exception existed in the case of articles affixed to the freehold, not for the purpose of enhancing its value, but for purposes of ornamentation. Such articles were removable by the person who had fixed them. This exception applied as between tenant for life and remaindermen, and it was of general application. The question here was whether these tapestries were affixed to the freehold so as to become part of the house or so as to be removable at the will and pleasure of the person who had affixed them during her lifetime, and by her executor after her death. They were no doubt as firmly fixed as though the person who had put them up had intended them to remain there always, but that was not of much importance. In all cases where the article was affixed to the freehold simply for purposes of ornamentation, the exception applied.

Liabilities of Lessors and Lessees.

Having now considered the responsibilities of landlord and tenant under the common law, and under the common forms of repairing covenant, it may be well before proceeding to the consideration of the actual survey, to summarise the liabilities of lessors and lessees.

Briefly then, the lessor is not liable to repair or even to rebuild in case of fire, even if he has received the insurance money. There is no implied covenant that the house is fit for occupation, or that it will last during the term. Neither is the landlord liable to the tenant's customers or guests for accidents happening when he lets a house in a dangerous state, there being no law against letting tumble-down houses; and in the case of *Manchester Bonded Warehouse Company* v. *Carr* (1880, 5 C.P.D., 507), where a building had fallen in consequence of a floor being overloaded with flour, and rent was claimed by the lessors during the time the building was unoccupied, the court said distinctly that they were not prepared to extend to ordinary leases of lands, houses or warehouses any implied covenant or warranty as in the cases of *Smith* v. *Marrable* and *Wilson* v. *Finch Hatton*, as they would be bound to do if they were to hold the plaintiffs liable for the fall of the warehouse by reason of any implied covenant or warranty. Lessees must use premises in a tenantlike manner, must commit no waste, must pay rent though premises be burnt down, must keep premises wind and water tight. A tenant for years is liable for permissive waste.

Under a covenant to keep premises in good and tenantable repair, the nature of which undertaking has been previously defined, the responsibility of the lessee is slight as regards actual structural repairs, but would appear to be considerable with regard to painting, papering, whitewashing, and such decorative work; a responsibility which, previous to decision of *Proudfoot* v. *Hart*, was looked upon as practically nil.

The lessee's responsibility under a repairing covenant to keep in substantial repair, &c., is much greater than that under a covenant for good tenantable repair; his liability extends to making good all dilapidations to the structure and decorations, except such as are caused by the natural operation of time and the elements in diminishing the value, the practical effect of which is set out in the case quoted of *Lister* v. *Lane*. Thus, if the premises are old at the time of the demise, he is bound only to execute such repairs as may be necessary to keep up the premises as old premises. It may be again mentioned that the courts now seem to construe the covenant on the part of the lessee to keep the premises in substantial repair in a less stringent way than formerly and pay more regard to the age and character of the premises than was hitherto the case. It may also be stated here that if the landlord neglects to do repairs which he is bound under a covenant to do, the tenant is not justified in leaving the premises, neither may he execute them and deduct the cost from the rent.

Surveys.

Having considered the obligations of landlord and tenant arising under the common law and under covenant, we proceed to the actual survey and preparation of the schedule and claim.

Before surveying, the nature of the tenancy will doubtless have been carefully considered, and in many cases the legal position will have been discussed with the lawyer.

In making his survey the architect should bear in mind that there is a wide practical distinction between an interim schedule and a schedule prepared at the expiration of the tenancy. Is is generally sufficient in the former case to prepare it, having particular regard only to such dilapidations the non-repair of which will cause injury to the structure to the reversion; such matters as decoration and details which concern the personal comfort of the tenant may very well be omitted. If the schedule is being prepared at the expiration of a tenancy, all matters for which the tenant is liable under the repairing covenant are of course included.

In the practice of preparing a schedule and claim the method varies very much, those prepared by architects generally going more into the detail necessary for the carrying out of the work of reinstatement than those prepared by surveyors; in fact, an architect's schedule purports to be in some cases a complete specification. There is no necessity for this: it may rather prove a disadvantage, for very often it happens that all that is necessary to be done to make good some of the defects cannot be foreseen till the work is actually being executed, and it may be that what is described is inadequate, or not the best way to do what is requisite. On the other hand it may specify a method of carrying out the repairs which is more elaborate and costly than the lessee can reasonably be expected to bear. It may therefore be taken as a good general rule that while the defects cannot be noted in too great detail, the specifying of the method of remedying them is not only unnecessary but unadvisable

Most architects follow their own system, but there is much in common in all the methods, and although the practice with regard to points of detail varies greatly, the following method of procedure will be found convenient: Before commencing to note the dilapidations take a general survey so as to get to understand the arrangement or plan of the premises; one can also see generally whether the tenant has been careful or otherwise in his use of them and preserved them by executing reasonable repairs at the proper time.

Examining the Roofs.

Having made this preliminary survey, commence with the exterior, the roof for preference, and keep the various parts of the building under separate heads, clearly defined so as to be easy to trace subsequently.

Examine the roof covering noting such defects as missing or slipped tiles and slates; examine the slate nails—they may be in a worthless state owing to rust. If the roof is generally uneven or baggy it indicates that the laths are decayed and a further examination may prove possibly that the rafters are decayed —maybe so much as to render it necessary for the roof to be stripped, firred up and relathed, retiled or reslated. Note any defective flashings and fillets against abutments, also any open joints indicating a want of pointing to the verges, ridges, hips or tiling generally.

While upon the roof any defects to the lead or zinc gutters or flats can be seen. It often happens in old houses that the fall of some portions of the gutters is defective; this may indicate a sagging of the bearers generally, attributable to decay, or it may be as the result of leaks; it will be necessary to take up and make good the woodwork and rèlay or renew the lead or zinc.

Next take the chimney shafts, parapet walls, &c., that can be seen from the roof. These must be carefully examined, particularly the chimney heads and pots, which are often out of the upright with many loose bricks and loose or missing pots. Also with regard to the open joints in the shafts which require pointing up, or the shaft itself may be so much out of the upright as to require rebuilding.

Parapet walls and copings should be examined for the same defects, namely, want of pointing, defective cramps or decayed bricks, some parts badly out of the upright, or some of the brickwork quite loose and requiring resetting. In many cases parapet walls are rendered; any defect in the condition of this should of course be noted.

While upon the roof look carefully over skylights, trapdoors, &c; these matters have generally been neglected, being more or less out of sight. Also any defects in the iron gutters should be taken while upon the roofs. They are often full of dirt, and the insides may not have been painted for many years, being consequently rusted almost through; also the cistern heads may be choked up. Lastly, before leaving the roof, take note of any painting.

Elevations and Exterior Generally.

Next proceed with the elevations. It is a good plan to have a system in dealing with them, say commencing with the front elevation and working round from east to west. Examine the condition of the brickwork for want of pointing generally, or round door or window frames, soft bricks, if the walls and gables are bulging or cracked, if bulging or cracked bearing in mind what has been said as to inherent defects; look to the arches for cracks and loose and dropping bricks, also the condition of the sills, string-courses and other ornamental features. If there is any rough-cast or cement work it should be carefully examined to see that it has not left the laths or walls. The stone steps, landings, &c, should be looked to and any defects noted, the condition of the woodwork examined, wood sills to windows being very liable to decay, and the condition of the rainwater piping, shutters, glazing and the painting inspected generally.

Having completed the elevations, look over the pavings, fences, also drains, &c. It is well to give the approximate quantity of paving that requires relaying, also details of the fencing. With regard to drains and sanitary fittings, it often happens that the drains if tested would be found to leak badly, also the soil and vent pipes at the joints. It would not be reasonable in the case of old houses to expect the drains to stand the water test, but it is often found that drains are partly choked up; leaky joints in a soil pipe would certainly generally be covered by the repairing covenant and would be scheduled.

Inspecting the Interior of Houses.

Having completed the exterior, proceed with the interior, taking it floor by floor (commencing at the top) with the passages last; then the staircases and landings to the floor below. It is well to have plan of the rooms in mind and to select a convenient point for commencing, and then to follow naturally through the various apartments, taking care to identify the rooms so that anyone can follow them.

Of course the method of procedure would vary with the size of the house. It is convenient in the case of a very large house to subdivide each floor into wings or the other natural divisions that the arrangement presents. Having settled the general lines of procedure, take room by room, carefully noting all defects to the structure first, then to the flooring, doors, architraves, skirtings, window sashes, frames or finishings, door and window furniture. Examine the fitting of all doors and windows and see if they open easily and properly; inspect the chimney-piece, hearth and grate. It may be necessary to clean the chimney-piece if there is no actual defect; the firebrick may be burnt out in the case of the grate; and the hearth broken, particularly in the case of an old house. In the case of repairs to flooring, distinctly mark the extent of the repairs called for unless they can be so explicitly stated as to be easily followed.

Having taken all defects existing to the structure, fittings, fixtures and finishings, proceed with the distempering and papering, making a note also of any baggy places in the ceilings indicating rotten laths or any defects to the wall plaster. In the case of distempering, papering and painting, it is well to include the necessary preparation previous to the execution of the works by a general clause; it saves much repetition and is a great convenience. Of course, in dealing with decorative work such as distempering, papering and painting, the nature of the work differs very greatly, not only such natural differences as one would expect to find in the different classes of houses, but in the actual decorations of houses of a similar class, and where the lease is silent as to the character of the decorations the architect has to rely solely upon his judgment.

Having dealt with every part of the house, there generally follow some general clauses, as sweeping the flues, blacking grates and ranges, oiling and repairing locks and window fastenings, overhauling water fittings, cleaning out cisterns, sweeping away rubbish and cleaning floors and windows.

It is a great convenience in going over the house again to see that the dilapidations have been properly made good, or in any future negotiations that may take place to have the book in which the dilapidations are entered carefully indexed and the headings of the rooms, &c., carefully and distinctly written; this is particularly so should the case ever come up for settlement in court and the architect has to give evidence.

The order given would be followed in dealing with stabling, outbuildings, &c., so far as they apply, taking each separately.

Preparing Schedules and Estimates.

In preparing a schedule and an estimate of the cost of reinstatement, it is better to take the necessary measurements and particulars for the purpose of the estimate after having noted the dilapidations for the purpose of the schedule. It does not follow by this that another survey is needed, because it may all be done at the one visit. Where two surveyors are appointed to settle a sum in lieu of carrying out the works, it is convenient to try and agree as to the repairs for which the lessee is liable before discussing the question of the damages. It should be remembered that the lessor can claim compensation for loss of rent for such a period as is reasonably necessary to enable the repairs to be carried out.

When advising tenants prior to entering into a lease, in the case of the lessee covenanting to keep and leave the premises in the same repair as at the commencement of the term, it is necessary to prepare a schedule very carefully so as accurately to show in detail the condition of the premises at the time, and the lessor should admit its accuracy before the lessee signs the lease.

There are many other points in connection with the survey and claims that might be touched upon did time permit, but I feel I have trespassed too long already upon your patience. However, if what I have said is found of some little use in focussing the main principles as laid down in some of the leading cases, and as gleaned from actual practice, it is the most I can hope for, and I shall feel that the object which I had in view has been attained.

BUILDING BY-LAWS IN RURAL DISTRICTS.

The R.I.B.A. and the L.G.B.

A DEPUTATION appointed by the council of the Royal Institute of British Architects waited on Mr. Grant Lawson, Parliamentary Secretary to the Local Government Board, on Tuesday, March 12th, to lay before him the views of the Institute on the question of administration of building by-laws in rural districts, which had already been expressed to the Local Government Board in October, 1899, when Mr. T. W. Russell received the representatives of the Institute.

The deputation consisted of the following gentlemen:—Mr. W. M Fawcett (past vice-president), Professor T. Roger Smith, Mr. Lacy W. Ridge, Mr. H. D. Searles Wood, Mr. E. Guy Dawber, and Mr. W. J. Locke, secretary.

The points submitted to Mr. Grant Lawson had been summarised as follows:—(1) That there has been of late a great increase of interference by public bodies and their officials with buildings in country places. (2) That this has arisen from the Local Government Board having permitted, and in fact encouraged, "rural authorities" to take to themselves "urban powers." (3) That such an assumption of powers by a local authority is an unnecessary and vexatious infringement of the liberty of the individual subject. (4) That it is undesirable, except perhaps in public buildings, that local authorities should relieve private persons from their responsibility for the soundness and sufficiency of their building construction. (5) That there is no desire on the part of the Royal Institute of British Architects to limit the application of such by-laws as are strictly sanitary in their object. (6) That there is no objection to by-laws as to the width of streets being generally applicable, as they would remain inoperative while a district remained rural. (7) That a complete and efficient by-law as to party-walls would sufficiently protect each individual from the danger of fire from his neighbour's premises in country places, in uncrowded districts, and wherever streets are laid out with the width and spaces required by the by-laws. (8) That in such places the minute requirements of the by-laws against fire, founded as they are on the legislation originally passed for overcrowded London after the Great Fire, are unnecessary and vexatious. They are frequently rendered grotesque by the erection of large structures in wood under the form of balconies and verandahs. (9) That the local authorities are practically dependent on the Local Government Board for assistance and direction in framing by-laws. (10) That the scheme of the R.I.B.A. is that the Local Government Board should arrange their model by-laws in divisions, and sanction in each district only such as are really needed therein, and so protect the public from vexatious interference in building. (11) That this is a matter to be met wholly by administration within the Board, and does not require legislation.

The following suggestions are made by the Royal Institute: (1) That the system for dealing with party-walls by the appointment of three surveyors as re-enacted in the London Building Act, 1894, has proved successful during a long period. That it is desirable that it should be extended to the growing suburbs around the districts of the London County Council, to such towns as are without special legislation on the subject, and to England and Wales generally. (2) That it would be desirable to establish a tribunal of appeal in connection with the Local Government Board for settling differences which arise as to the meaning of by-laws and building regulations. That to be of value the tribunal must act with speed and have technical knowledge.

Mr. Grant Lawson, replying to arguments in support of the above points, said that both the President of the Local Goverment Board and himself were agreed that evils did exist in the present system of administration of building by-laws, and that there should be a difference in the codification of by-laws for rural and for urban districts. The proposals of the Royal Institute had received careful consideration, and since the appointment of Mr. Walter Long and himself efforts had been made as far as possible to adopt them. Mr. Lawson first desired to point out that it was not the function of the Local Government Board to take the initiative in the question of district by-laws; the Board only approved by-laws submitted to them by local authorities. It was not in the power of the Board to compel a local authority to adopt any particular set of by-laws. As regards encouraging local bodies to take "urban powers," the Board only did so in cases where very insanitary conditions rendered such a course desirable. With regard to meeting the views of the Institute the Board had drawn up a set of proposed model by-laws for rural district councils, on which he invited the opinion of the Institute. These by-laws were scheduled as follows:—

(*a*) Interpretation of terms.

(*b*) Exempted buildings.

(*c*) Structure of walls and foundations of new buildings for purposes of health. With respect to the sufficiency of the space about buildings to secure a free circulation of air, and with respect to the ventilation of buildings.

(*d*) With respect to the drainage of buildings.

(*e*) With respect to water-closets in connection with buildings, and with respect to the keeping of water-closets supplied with sufficient water for flushing.

(*f*) With respect to earth-closets and privies in connection with buildings.

(*g*) With respect to ashpits in connection with buildings.

(*h*) With respect to cesspools in connection with buildings.

(*i*) With respect to the closing of buildings, or parts of buildings, unfit for human habitation and to the prohibition of their use for such habitation.

(*j*) As to the giving of notice; as to the deposit of plans and sections by persons intending to construct buildings; and as to inspection by the council.

(*k*) Penalties.

(*l*) As to the power of the council to remove, alter, or pull down any work begun or done in contravention of the by-laws.

(*m*) Repeal of by-laws.

Mr. Grant Lawson pointed out that these proposed by-laws were mainly sanitary in their application, and that regulations as to materials and structural details were omitted. With regard to the request of the Institute for an extension by legislative means of the party-wall system in London to all districts in England and Wales where no special legislation existed, Mr. Lawson said that he could not promise any action this summer, but he would add the subject to the list of Bills which the Local Government Board hoped to introduce at some period during the continuance of the present Government.

The deputation having thanked Mr. Lawson for the courteous action of the Local Government Board in submitting the draft model by-laws for the consideration of the Institute, and also for the sympathetic manner in which he had received them, then withdrew.

The questions are now before the original committee of 1899, who are preparing a report to the Council.

Correspondence.

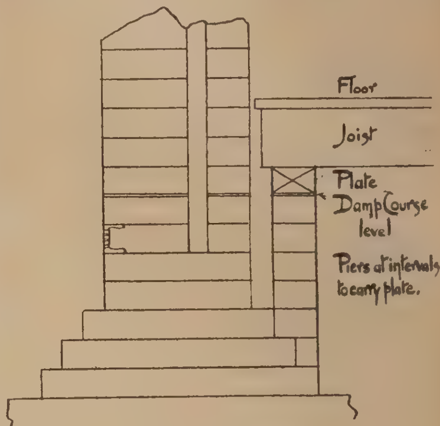
Footings for Hollow Walls.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—I note in your issue for March 13th a reply to a query about hollow walls which seems to me capable of improvement. It is well known that in practice it is very difficult to build hollow walls without a certain amount of mortar dropping down into the cavity, and so accumulating at the bottom, where it would rest upon the damp-course (see sketch on p. 105 of your issue for March 13th, and also on p. 49 of your issue for February 20th last). This would allow the damp to be conveyed to the inner wall *above* the damp-course. For this reason I would suggest that the damp-course should be placed higher in the hollow wall than shown, and divided into two distinct portions. All this is clearly shown in the illustration facing p. 145 of "Specification," No. 4, of 1899, which is a very much better method than that illustrated in the two numbers of your journal above mentioned. I make this comment as I find my students at the Architectural Association accept the answers to queries in your paper as the *best* method of doing work, which I do not take the two methods above illustrated to be.—Yours truly,

MAX CLARKE.



HOLLOW WALLS.

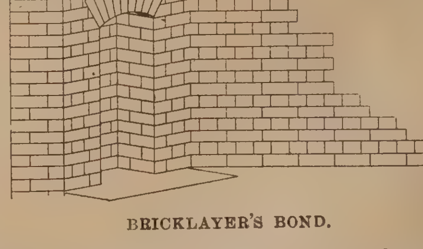
Bricklayer's Bond.

To the Editor of THE BUILDERS' JOURNAL.

WALTON-ON-THAMES.

SIR,—Mr. Carden's reply confirms my opinion that an uncertainty exists as to bond. According to Mr. Carden, any brick that has to be reduced is brought under the head "cutting. I am not an authority on the matter, but think that such is not the case: the term is only applied to bricks that are made to fit a template. The various shapes shown by Mr. Carden round his flues would turn a builder's hair grey. I send a sketch elevation of one angle fireplace taken from Mr. Carden's plan and worked by the method shown by me in your last issue. In reply to Mr. Carden, Figs. 5 and 6 were suggested to me by the courses marked A B on his drawing, and were intended to show the bond in the *angles*. As to cutting the "three-quarter bats," that is a very simple operation compared to the angular pieces.—Yours truly,

ROBERT RAMM



BRICKLAYER'S BOND.

The New Series of the "Builders' Journal."

To the Editor of THE BUILDERS' JOURNAL.

OXFORD.

SIR.—I am sure there is no reader of your valuable journal who can *fairly* grumble at the decision of the proprietors to raise the price.

Ever since I commenced taking it in I have wondered how it could be "done for the money." I have found it an excellent source of information, and I cannot remember a week but what something of fresh interest and information has appeared in its pages.

It is no matter for wonder that the "Enquiry" column has assumed such proportions when the answers always seem so clear and concise.

Wishing you continued success and ever-increasing circulation.—Yours faithfully.

G. G.

[It is very gratifying to us to learn from the numerous letters which we have received, of which the above is a specimen, that our readers so greatly appreciate our journal.—ED. B. J.]

Paving for Brewery Floors,

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On page 122 of your last issue either Victoria stone slabs or Adamant pavement slabs are recommended as the most suitable paving for brewery floors; but as the result of a long experience I should recommend the work to be laid *in situ*. Slabs, however well laid, are sure to crack when subject to the fall of casks. I should advise the use of Potter and Co.'s (109 Victoria Street, S W.) concrete, or Eureka concrete, as manufactured by W. Millar, 1 and 3 Arches, Battersea Park Station, London. Both of these concretes are acid-proof.—Yours truly,

BREWERY CLERK OF WORKS.

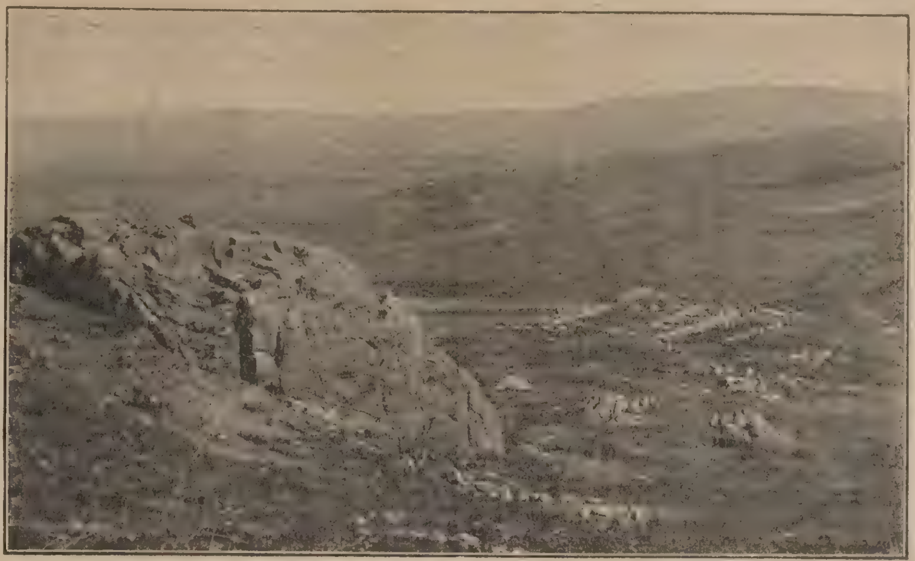
Builders' Notes.

The Will of Mr. H. H. Eadon, builder, Heavygate Road, Walkley, who died on September 21st, amounts to £2,030 14s. 3d.

London County Council.—At last week's meeting of the Council the tender of Messrs. Mattin, Wells and Co., amounting to £8,129, was accepted for the erection of a new fire station at Homerton.

The North Staffordshire Builders' Association, in its annual report, states that 95 per cent. of the builders in the district are members, all of whom have insured their workmen at special low rates against accident. The increasing balance at the bank would be used to form a nucleus for a Builders' Provident Institution or Builders' Exchange, where the members of all branches of the building trade could meet for trade or club purposes. At the beginning of last year the bricklayers gave notice for an advance of ¾d. per hour. The masters offered ¼d., and there was a strike, and an arrangement was come to. This year the stonemasons had given notice for an advance of ¾d., and the association had offered them ½d per hour. The labourers had also given notice for an advance, but as it was not sent as per rule or custom the employers had decided not to entertain it.

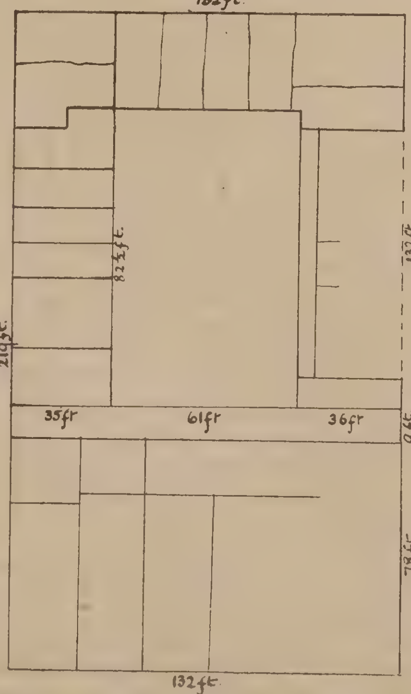
Fire-resisting Glass.—At the glass-works of Messrs. Pilkington Brothers, Grove Street, St. Helens, an interesting series of experiments were carried out recently to demonstrate the efficacy of a new fire-resisting glass which the firm has invented. The glass is a rolled plate with a wire mesh inserted during the making, and it is claimed that in any ordinary fire it will remain connected, and thus minimise the risk of the fire being communicated to other departments. A building was erected with glass sides, and filled with combustible material which was set aflame, but though the glass cracked there was no breakage to any extent Water was then poured upon the building, and though the glass cracked into minute fragments, the wire mesh held it together so that if the panels had been in an ordinary building there would have been little risk of the fire extending.



VIEW OF THE PALACE AND "THEATRE" OF THE HITTITES, BOGHAZ KEOY.

THE HITTITE CITIES OF EYUK AND BOGHAZ KEOY.

AS we announced on page 111 of our last issue, at the moment of going to press we received from the Rev. G. E. White, of Marsovan, Turkey, a photograph and some particulars of the palace and "theatre" of the Hittites at Boghaz Keoy, and would publish them in the next issue. This we now do. The theatre appears in the foreground of the photograph, a huge rock, on one side of the top of which an auditorium has been hewed out, somewhat after the manner of a primitive Greek theatre. It would hold about 100 persons. The focus, where holes drilled in the rock may have supported some players' platform or judges' bench, is at the corner nearest the observer. Below the theatre on the open plain, but within the old city wall, appears the palace This is a mighty ruin, half buried in the platform of earth on which it stood, and which was from 10ft. to 20ft. above the ground. The building consisted of two parts separated by an alley 9ft. wide. The smaller was perhaps the harem or quarters devoted to the ladies of the royal household. The larger part is a square 132ft. each way, and consists of a large central court, after the fashion so favoured by Orientals, surrounded by a series of rooms on every side but one, that being reserved for the approach. The court is 61ft. by 82ft. 6in. The ruins now contain little but the long lines of massive stones, showing where the division walls were placed. The stones go down deep into the ground, but how deep could only be learned by digging; it is many feet, as appears from small diggings that have been made, none of which go to the bottom of the foundation stones. Not far away is the overturned throne, a seat cut between two lions in a stone from 4ft. to 6ft. in each of its dimensions. Some of the stones now seen in the palace measure in size 4 57 × 2 × 1·50 meters; 4 90 × 2 × 1 50; 4 80 × 2·62 × 1 47; and 3 64 × 2 50 × 1 80. On the side nearly looking south there are no rooms, but this was the approach to the building. The ruins of the grand stairway may still be seen, terminating in the central court or reception room. The interest of an amateur is greatly roused by the sight of such a building, worthy perhaps of classification with some of the famous structures in the valley of the Euphrates or the Nile. "I wish," says Mr. White, "it might be examined by a professional architect in a scientific way."



PALACE OF THE HITTITES, BOGHAZ KEOY.

Law Cases.

Blue Lias Lime: An Unsuccessful Claim.—At Westminster last Wednesday judgment was given by Mr. Horace Smith in the case of the Cam Portland Cement Company, of Meldreth, Royston, Cambridgeshire, summoned by the Blue Lias Lime Burners' Association, of Westminster, for the alleged offence under the Merchandise Marks Act of unlawfully applying with fraudulent intent a false trade description to certain lime. The matter in dispute, which was long fought out with expert witnesses, was whether the defendants were entitled to use the term "blue lias" for the hydraulic lime manufactured in Cambridgeshire. The complainants contended that the "blue lias" formation was unknown in the county, and was generally confined to the Midlands. His worship held that the weight of evidence showed that "blue lias" was a generic term accepted by merchants, architects and engineers. There was no fradulent application of the name of a particular locality to the article sold. If the defendants had called their lime "Warwickshire" hydraulic lime a conviction might have followed. As it was, the summonses would be dismissed, without costs.

Mortar Made with Sewage.—Herbert Foster, of Five Ways, was charged at the Cannock Police Court recently with erecting certain walls with insanitary mortar. The case for the prosecution was that the defendant, who was erecting some houses at Blackfords, Cannock, had built some of the walls with mortar mixed with sewage matter instead of clean water. He was the owner of some houses which drained into a pit or catch-trap and then flowed into the sewer. This pit was open, and the mortar had been made with water taken from it. The defendant was served with a notice to at once pull down any portion of the new buildings which had been constructed with such mortar, but no notice was taken of the letter. The matter came before the Council, who resolved that the surveyor should serve notices to pull down the walls and disinfect the premises. Lord Hatherton said by-laws were made for the protection of people who could not protect themselves, and must be complied with. Even mortar mixed with injurious matter must be injurious to health. The defendant had been given every opportunity of making good the defective water while the walls were of little height. The order for pulling down the premises was granted.

Advertising Hoardings—At Greenwich last week Walter Hill and Co., Ltd., of Southampton Row, W.C., were summoned by the London County Council for erecting on the forecourts of certain houses in Sydenham a structure in contravention of Part III of the London Building Act. Mr. Chilvers, for the Council, said that the structure, which was erected without the consent of the Council, was an advertising hoarding, 12ft. in height and 336ft. in length, and was entirely in advance of the general building line. Mr. Bethune, for the defendants, argued that the hoarding differed in no respect from an ordinary builder's hoarding, and that it practically enclosed vacant land, as the houses, which belonged to the Leathersellers' Company, were in a bad condition and, with one exception, unoccupied. The houses were about to come down. Times were bad enough just now, and he did not think the owners could be blamed for seeking to get some income from the hoarding. He argued that the hoarding was not a structure to which the Act applied, and that it was a temporary erection. Evidence was called on both sides, and eventually Mr. Kennedy said that there was a degree of permanence about the erection, which had been standing six months and was very likely to remain. He regarded the hoarding as a structure, and could not recognise it as enclosing only vacant land. There would be an order to remove the structure within fourteen days, and the defendants would be fined 40s. and five guineas costs.

An Architect and his Building Club.—The case was recently heard at the Glamorgan Assize in which Mr. George Campbell Davies, architect, of Aberdare, claimed from the Pontyrhun Building Club £600 in respect of professional services rendered. Plaintiff had the idea of acquiring and laying out for building purposes a field belonging to the Mackintosh Estate. He got together a number of people who were wishful to build their own houses, and a building club was formed, the plaintiff being engaged as architect. The first difficulty arose when the plans of the proposed new houses were rejected as unsatisfactory by the Merthyr Urban District Council. Negotiations came to a standstill, and in the end the building club and the architect severed all connection. Plaintiff, at the request of the building club, had prepared plans, specifications, &c., for a number of cottages and semi-detached villas, made out bills of quantities, invited tenders, &c., and now the defendants said that he had been guilty of misrepresentation. Defendants put in a counter-claim for £146 15s. 6d. on the ground that the plaintiff had not been authorised to do the alleged or any work, and they also alleged that on account of the plaintiff's neglect they were unable to proceed with the erection of the houses. Learned counsel having addressed the jury, his lordship summed up. The jury returned a verdict for the plaintiff for £110 and costs on the claim, and for £21 15s. 6d. and costs for the defendants on the counter-claim.

Plans for a Bungalow.—In the King's Bench Division of the High Court of Justice on March 14th the case of *Parsons* v. *Jones* was concluded. This was an action by Mr. Charles F. Parsons, a young architect, who sued Mr. Jones, a gentleman of independent means, for drawings, plans, &c. supplied for building a bungalow and a boathouse at Lowestoft and other places. The defendant engaged an architect of his own, but as he did not complete the work rapidly enough the defendant came to plaintiff, who was the son of defendant's builder, and authorised him to get out the plans and drawings. The defence was that the plaintiff being the son of defendant's builder, the defendant understood that all the plans, &c., were charged for in the builder's prices. The evidence having been concluded, counsel for the defence addressed the jury, and said the charges made for these plans were clearly an afterthought, because the defendant had a receipt for the money paid by him for building, the receipt being given to include "all drawings, plans, &c." It was evident that after the money was paid the plaintiff's family had decided to make these extra charges, hoping they would be able to secure something. Mr. Cababé, in reply, said it was clear that the defendant had made himself liable, as the plaintiff had stated that in every single case he got the orders to make plans expressly from the defendant himself. On defendant's own showing the claim was an honest one, the question of the value being one for the jury. The jury gave a verdict for the plaintiff with £45 damages. Judgment was given for that amount with costs.

Professional Practice.

Richmond.—Six separate new buildings for the improvement of the accommodation at the workhouse are being erected on garden ground attached to the existing workhouse, by Messrs. S. N. Soole and Son. The building consists of a female infirmary block, lying-in ward, nurses' home, male infirmary, lunatic wards, and ambulance house and mortuary. The five blocks intended for habitation have been arranged so that they each run longitudinally north-east and south-west, and by this means the rays of the sun are enabled to shine during some part of the day on every side of each building. The female and male infirmary blocks are connected on each floor by corridors, from which short branches connect to the lying-in ward and nurses' home. Along the centre of the ground-floor main corridor a trench is formed, in which the various mains will be placed; this will enable any part of the mains to be readily examined. To provide for the supply of water for domestic purposes beyond the ordinary storage tank a large tank to contain about 8,000 gallons has been provided at the top of the sanitary annexe attached to the female infirmary. The female block comprises ground, first, and second floors, each containing a large ward for twenty-four beds, a smaller ward containing three beds, a day-room and a duty-room, besides larder, linen store, brush store, and the necessary sanitary accommodation. Access to the twenty-four bed ward is obtained by folding doors from the landing at one end, and at the other opens on to an external balcony with a south-east aspect. The walls will be plastered, and the junction between the floor and wall, which is so difficult to keep clear of dust, will be formed with a slight hollow, so that no corners will be left, and perfect cleansing can be readily performed. The duty-room is so placed as to be approached direct from the landing, and at the same time immediately adjoining the large ward, from which it is divided by a wall in which is placed a small window for supervision purposes. This duty-room will be completely fitted with sink, dresser, and small range, and will be independent of other parts of the house except for general cooking purposes. Opening off the same landing is the three-bed ward before referred to, which will be finished off in a manner very similar to the large ward; separate w.c. and lavatory accommodation has been provided. The day-room, 20ft. in length, has a bay window at one end, and opens off the same landing. The larder and stores are conveniently arranged opposite the day-room, and adjoining these is a short branch passage leading to the main sanitary annexe, which provides complete accommodation on each floor. Access to this sanitary annexe may be obtained from the landing without having to pass through any ward or room, and is separated from the main building by a cross-ventilated lobby; this also affording another outlet to the balcony, contains a bath-room, a range of lavatory basins, two w.c.'s and a slop sink. It is intended to line the walls of the sanitary apartments with white tiling. The landing from which all these rooms are directly approached also opens direct on to the corridor at the various floor-levels, giving easy access to the other buildings. The flooring, as also that of the sanitary annexe and w.c.'s, will be of terrazzo, with a hollow formed next the walls to prevent accumulation of dirt. The only accommodation provided below the ground-level is a coal-cellar (under the sanitary annexe) and a boiler-house (under the stores and a portion of the ground-floor landing). The entrance to this boiler-house is formed in the external wall, and not obtained by internal stairs, so that this accommodation is effectually separated from the main building. In this boiler-house will be placed the boilers and circulating cylinder required for separate hot water services for warming purposes and the supply of hot water for washing and domestic purposes, and branches will be taken from these to the next block, so that separate boilers for that block will not be necessary. The lying-in ward is placed next in order to the female infirmary and is approached by a short branch from the main corridor. The accommodation of this block comprises a lying-in ward for six beds, two labour rooms, duty room, larder, bathroom and store. The ward and labour rooms will follow the general description of the large wards in the female block. The dispensary is arranged in this block, but is approached by a separate entrance from the corridor. The nurses' home is placed between the lying-in ward and the male infirmary. This block consists of three floors, from each of which access is obtained by short branches to the main corridor. The general arrangement on each floor is a central passage or corridor, with the various rooms opening directly from it. The ground floor contains nurses' dining- and sitting-rooms, with separate dining-room for the subordinate nurses or wardmaids, and a private sitting room with bedroom attached reserved for the superintendent nurse. A kitchen is provided next the nurses' dining-room, with serving hatch thereto, and larder attached. A good linen store and bootroom are also provided, and at the end of the block lavatory and w.c. accommodation has been arranged. On the first floor are arranged 12 separate bedrooms, with bathroom and w.c. opening from the landing opposite the stairs, and on the second floor are 12 more bedrooms and similar sanitary accommodation; but of these 12 rooms four are arranged for two beds each, thus providing for 16 wardmaids. The only accommodation provided in this block below the ground level is a boxroom and coal-cellar. The male infirmary is placed at the other end of the main corridor, which runs in a direct line from the female infirmary. This building is very similar in general arrangement to the female infirmary before described. The accommodation for inmates is in every way similar, and offers, as the other block, provision for 81 inmates. The fifth block is that provided for the reception of lunatics. The building consists of a ground-floor only, and comprises two separate two-bed wards, with attendant's room adjoining each, fitted with supervision window. There is also a padded room provided. The sixth building is a small detached erection in the corner of the site, and only contains the ambulance house and mortuary. The whole of the buildings are intended to be erected in stock bricks, with red-brick facings, relieved by lintels and strings of Portland stone, and the roofs will be covered with green slates. The architect is Mr. Edward J. Partridge, F.S.I.

A new Church at Great Bridge, Tipton, is to be erected on a site in the New Road, to be dedicated to St. Luke. The chancel is now being erected at an estimated cost of £600. The architecture of the church will be an adaptation of old English style, and the work is being carried out by Messrs. Smith and Son, of West Bromwich, to designs of Mr. Jabez Pearson, of Great Bridge.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Floor for Gymnasium.

MANCHESTER.—A. V. R. writes: "I am at present preparing plans for a gymnasium in connection with a lads' club. The present gymnasium floor is of concrete, and although gymnasium mats are used, a somewhat severe shake is experienced by the boys when jumping from the different apparatuses; this I wish to avoid, or at any rate to minimise as much as possible. Would a floor be suitable if constructed of 5in. of concrete in which are embedded 4in. by 2½in. fillets carrying 1in. flooring boards with thick roofing felt under them?"

The construction described by querist would be suitable, but the space below the boards being too shallow for ventilation the fillets should be creosoted to prevent them from decay. There may be a slight smell at first, but not more than would be caused by the roofing felt alone. HENRY ADAMS.

Builders' Book-keeping.

MALTON, YORKS—F. N. R. writes: "I manage a business consisting mostly of jobbing work, and wish to keep the cost of each item. Which is the simplest method of doing this? The men use time sheets, but are, as a rule, very poor scholars."

The querist apparently wishes to keep separate the cost of each trade in each item of repair. Unless he has plenty of time on his hands, and plenty of patience, he is advised to make the separate items as few as possible. Workmen seldom realise the necessity of keeping strict account of time and material, and generally resent having to do what they term "office work." Unless there is in each, or any, job some one or more items which stand out quite distinct and separate from other work, no really useful purpose is served by microscopic dissection. The simplest method that can be recommended (this is, of course, without knowing any of the querist's special requirements) is to have a general order book, each job as entered being provided with a number. Official order slips (printed ones soon save the cost of printing) bearing the number should be issued to the leading tradesman on the job, and it should be his business to see that each man on the job books his time to that number. To take care of distinct sub-items in jobs, a sub-order book should be provided—one for each trade if the magnitude of the business requires it—and, as an illustration, each rod set out by carpenter or joiner might be the subject of a separate sub-order. When the job is complete, the workman holding the order slip should return it to the office, bearing on the back an account of materials used, or, where several trades are engaged, each leading man in his trade might be required to render the account of materials on the back (or face) of his time sheet. Use of scaffolding, unless on a job of some extent, is best charged up as a percentage on the cost of the job, or upon the cost of the time, the latter being the preferable though not the most usual method.

Creosoting Timber.

KILMARNOCK.—WOODSTOCK writes: "Is there any method of creosoting timber other than in a specially constructed chamber under pressure? What kind of oil is used?"

The proper method of creosoting timber is to place the logs in a closed wrought-iron cylindrical vessel like the shell of a Lancashire boiler, say 7ft. diameter and 60ft. long, with a door at one end and tram rails laid inside along the bottom. The timber is placed upon trolleys with chains or iron hoops over the top to keep the timber from floating when the creosote is let in, and the trolleys are run into the cylinder. The door is then shut and a vacuum of 7 or 8lbs. per sq. in. is created; after a short interval creosote (oil of tar) at a temperature of 120degs. Fahr. is allowed to enter, the vacuum is maintained until all the timber is submerged, and then the pressure is raised to about 150lbs. per sq. in., both the temperature and pressure being maintained for 6 to 10 hours. The usual specification clause is, "The whole of the piles are to be creosoted under pressure with not less than 8lbs. of creosote to each cubic foot of timber," but the amount actually taken up will depend very much upon the quality of the timber; for instance, good Memel will take up comparatively little, while coarse Dantzic with a large proportion of sap will absorb a considerable amount. Timber is not creosoted if merely plunged in a tar tank; it should show distinct signs of permeation when cut through the middle, and this can only be obtained when the creosote is forced through the whole length of the timber. In the early days of creosoting, known then as the Bethell process, the end of the log was covered with a pressure-tight cap and the liquid forced through by pumping, but this was too slow for business purposes. A new method of preserving timber, which is likely to displace creosoting as being cheaper and better, is Haskin's process of vulcanising (or Haskinising). "It consists in placing raw wood in a cylindrical treating chamber, made of boiler-plate, of any size, or numbers of them placed together according to the output required, and submitting the same for a few hours to a medium of superheated, circulating, compressed air, which effects a chemical change. The air-pressure employed prevents evaporation, while the intense heat passes through to the centre of the timber, causing the constituents to organise into an oleaginous compound, saturating the fibre and filling the pores. In cooling down under the same pressure the new compound becomes consolidated with the fibre, thus indurating, strengthening, perfecting, beautifying and preserving the wood from decay. The germinative principle inherent in the sap is destroyed, all fungi, germs or insect life are killed, and no offensive odour is emitted from the wood after treatment." Briefly, it may be termed an internal autogenic dry creosoting. HENRY ADAMS.

Artificial Seasoning of Timber.

CROYDON.—SUGGESTIONS writes: "Which is the best means of forming a drying-room for timber? Is a system of hot-water pipes with a fan to make a current a good one? If so, should the inlet be arranged with a coil of heated pipes for the air to pass over?"

The method of artificially seasoning timber is not to be recommended, especially in a room heated above the temperature to which any wood is ever likely to be subjected, as the warm stagnant atmosphere retains the evaporated moisture. There seems no objection to the admission of hot air in the lower part of the room, providing it is permitted to escape above, so carrying off the absorbed moisture; but I have seen timber (battens and boards) much injured in this way, especially when not laid flat, but stacked edgeways. The best means of forming a drying-room is to have built-up piers about 3ft. to 4ft. wide and two bricks thick to carry the roof principals, these being about 12ft. apart and filled in with louvre boards and the eaves to protect the timber from sun and rain. The arrangement of hot-water pipes with a fan as suggested would probably be a saving in cost where the spent steam from the engine-room could be utilised, but care should be taken to carry off the evaporation of moisture. Tarbuck gives the velocity of 100ft. per second as best for hot air. W. E. C.

Testimonies of Study.

NEWTON ABBOT.—IN DOUBT writes: "I am about to make drawings of the Doric, Ionic and Corinthian Orders as 'Testimonies of Study' required by the Royal Academy and the R.I.B.A. It is my intention to copy them from Mr. Phené Spiers' book, but I am in doubt as to the best examples to select for the purpose; that is to say, should they be Greek or Roman, and, if the latter, would it be advisable to copy the Orders of Vignola and Palladio or those obtained from the original remains? In the statement of particulars in the R.I.B.A. Kalendar the following occurs: 'and details to three times the scale of the columns.' Does this refer to the enrichments of mouldings or the mouldings themselves?"

Greek examples are best, then Roman. The Orders of Vignola and Palladio are not truly Classic, but Italian Renaissance. For the R.I.B.A. any spare space upon the sheets should be well covered with details, both of mouldings and enrichments. If time and money for the purpose can be afforded, it is best of all to measure the Order from the Mausoleum of Habiamassus, now in the British Museum, for one of the sheets, permission to do so being readily granted on written application to the Director of Greek and Roman Antiquities, accompanied by a letter of recommendation from some householder whose identity can be easily established. G. A. T. M.

Estimating for Small Jobs.

HULL.—STUDENT writes: "Which is the proper way to approximately estimate for small alterations—for example, a shop front to be put in, and a few walls altered?"

There is no easy way of forming a reliable estimate for alterations to existing buildings; the cost necessarily varies according to the special conditions of each case. Having obtained full particulars of the alterations required, the building must be carefully inspected as to its general construction, condition and surroundings. Any local difficulties which may increase the cost of carrying out the work should be noted. Allow for providing, fixing and removing temporary shoring or strutting to all walls or floors affected by the alterations, and making good to same. Provide for removing the existing window and fittings, also for taking down old brickwork, including cleaning and stacking the bricks for re-use. Measure the quantity of new brickwork required, also the toothing and bonding in of the new work to old walls. The proposed new shop front, door, bressummer and finishings to be measured and priced according to their several materials and workmanship. Ascertain the quantities of glass, painting, &c., together with any alterations to existing gas-pipes or new fittings required. Provision should be made for any repairs, additions, or renewals to floors, plastering, papering, &c., as may be necessary. T. E. C.

Right to Use Well.

HARD LINES writes: "We took a cottage as a branch office in a country place on a three years' agreement. We gave up the garden behind voluntarily, and—unfortunately for us—this was put in the agreement. We have had access to the well in the garden from the commencement, and without hindrance or protest from our landlord, who lives next door. He has now put up an obstruction to stop our water-supply from this well. Can he do this legally, and could we at our own expense have water laid on from pipes now in the public road for our own use without his sanction or interference?"

You do not appear to have acquired any right to use the water-supply in question. You could have water laid on at your own expense in the manner proposed. A. O. H.

Masters and Men.

The Cement Trade Dispute at Rochester.—The cement factories at Frindsbury, near Rochester, belonging to the Associated Portland Cement Manufacturers, Limited, have been shut down and the day-work hands dismissed, owing to the strike of piecework hands, who refused to accept lower wages. About 600 men are affected.

Dispute in the Gritstone Trade.—Strike notices were served recently on the Rowsley Masters' Federation in the gritstone trade affecting a large number of quarries, yards, masters, and men. The notices will expire the first week in April. The dispute is a demand for higher wages. The quarrymen went out on strike at the latter end of last year on new regulations formulated by the federation. As trade is brisk the outlook is serious.

Bricks and Mortar.

APHORISM FOR THE WEEK.

They make a front just like St. Paul's,
Or like Westminster Abbey,
And then as if to cheat the Lord
They make the back part shabby.

C. H. SPURGEON on Chapel Building [Committees.

The Housing Problem Again. THE housing problem formed the subject of a paper, to which the Howard Medal has been awarded, read to members of the Royal Statistical Society last week by Dr. J. F. J. Sykes. The author referred to the legislation on the subject since 1851 and traced its development, suggesting that further law was required to regulate the conditions under which houses originally intended for the occupation of a single family of a more wealthy class were adapted for the use of one or more sets of poorer occupants. In the past fifty years London municipalities had constructed dwellings containing 6,132 rooms, organised private action having provided 50,402 rooms. The cost of construction varied from £35 per room in the country to £135 in London County Council tenements. He disapproved of single rooms as tending to degradation and decadence, and suggested that the powers now given to enable private associations to borrow public money for the construction of workmen's dwellings should be extended so as to apply not only to freehold, as at present, but also to long leasehold property. In the course of the discussion which followed, Mr. W. W. Bruce said the London County Council had housed as many as they had displaced. The action of the late Board of Works in selling sites had complicated matters. A vast value in London was being put to an improper use in housing people on extremely valuable land, especially as the result of the Holborn to Strand improvement, where the value had been written down. It was three times the housing value assigned it. The only cure was to get the people further out, and set the land free for the purposes intended. He did not think that municipal enterprise would interfere with private undertakings. Lord Avebury said that the class housed was not the class dishoused. If local authorities made it clear that they did not intend to compete the case would be different, but as it was their regulations made it very difficult for private individuals to carry out the work, whereas private enterprise would do much to solve the problem. Sir H. Burdett urged the case of the poor, who must live nearer the richer quarters to do the rough work, and he considered that the ground landlord should be made to live up to his property, and made to provide for those he displaced

Ugly Cottages. MR. J. HENRY BROWN, writing to the "Nottingham Daily Guardian," points out that Nottinghamshire is about to be the centre of a very great coal trade, "and perhaps scores of our hitherto picturesque villages will undergo a transformation by the building of colliers' cottages. Hitherto the architecture of these cottages has been a minus quantity. Anything more outwardly hideous than the long rows of grimy brick cottages and their black Welsh slate roofs it is difficult to conceive. The decadence seems to have set in within the past thirty years, and hereabout what may be termed the native cottage architecture is very pleasing. They are built of a local yellow sandstone, and have bright red Dutch-tiled roofs, also made in the neighbourhood. The contrast is complete. I would ask if there be not any great landowner, colliery company, speculative builder, or small proprietor who will not, for example's sake, rescue the country from the 'close clinging damnation,' to use Ruskin's bold phrase, of the collier's cottage. . ... It seems to me that the man who first introduced the black Welsh slate roof was a malefactor of the highest degree. I should like to think he has had his day; and that having utterly uglified Derbyshire it ought to be a matter of county pride to keep him out of Nottinghamshire."

A Scotch Parthenon. IN the course of the lecture on the work of Professor Cockerell, delivered recently before the Edinburgh Architectural Association, Mr. J. M. Brydon, F.R.I.B A., referred to the National Monument on Calton Hill, Edinburgh, as evidence of Cockerell's participation. He admitted that his connection with the work came as a surprise to him, as doubtless it would be to some of his audience. Cockerell's original sketches and drawings (which were exhibited to the meeting) were the first idea of the monument, which was to be a reproduction of the Parthenon. The foundation-stone was laid in 1822, and Cockerell's sketches enabled one to see the mode by which the interior of the monument was intended to be lighted. The method seemed to forestall the clerestory theory of the lighting of Greek temples. There were also shown the working drawings by Playfair of the portion erected in 1826. Between the preparation of Cockerell's sketches and the laying of the foundation-stone of the actual commencement of the work from Playfair's drawings, said Mr. Brydon, there was an interval of some years, and one could only conjecture that something had occurred which caused the transference of the work from one architect to the other, or that the two architects went in conjunction under some arrangement, the traces of which were now lost. The two must have been congenial spirits, alike in their knowledge and devotion to the study of Greek art Vaulting ambition again, however, o'erleaped itself. The monument was never completed, and to-day it looked more like the ghost of the Parthenon that was. Nevertheless the spirit of the Greek temple was in the fragment on the Calton Hill. Its exquisite proportion, its beauty of detail, showed the artist's true spirit. There was no doubt the intention was to represent the Parthenon. In the elaborate account of the laying of the foundation-stone there was curiously not a word said about the architect. It had always been his impression that they began the building with the idea that they were going to make a reproduction of the Parthenon, and that they went on until the money stopped. Playfair's drawing was the contract drawing for exactly the piece that was built and nothing more. In the discussion following upon the paper, Mr. Hippolyte Blanc said the information about the monument was certainly new to him. The question of the completion of the monument had been recently opened up as a suggested memorial to the late Queen, but he could not but feel that with the evidence of the intention to build only a certain part of the structure there was a sacred thought in the minds of those who had schemed the monument that it should never be other than the suggestion of a ruin.

The World's Great Memorials. AN interesting account of the great memorials of the world, by Mr. Claude Phillips, was published last week in the "Daily Telegraph." Passing over the august civilisations of Egypt, of Chaldea, of pre-archaic Greece, we come at once to classic Greece. Here the typical instance is, of course, the Mausoleum, that world-famous monument raised by Artemisia, Queen of Caria, to her beloved Mausolus, the size, splendour and unusual construction of which demanded the admiration of posterity. The wonderful frieze and fragments in the British Museum prove that the Mausoleum was second in exquisiteness of plastic adornment to the Parthenon alone, and worthy of the four great sculptors, Scopas, Leochares, Bryaxis and Timotheus, who were employed upon it. Of the Mausoleum of Hadrian, the core of which, stripped of all its sumptuous enveloping decoration of marble and gilt bronze, and its wilderness of statues, survives in the castle of S. Angelo at Rome, there is nothing new to be said. The next mausoleum to be mentioned is the Taj-Mahal of Agra, built by the Emperor Shah-Jahan to enshrine the remains of his favourite wife, Mumtaza-Mahal, and his own, when after an interval he was joined to her again. This well-known building is certainly one of the most beautiful in the world.

It was very much the custom in the fifteenth and sixteenth centuries for princes and rulers to care themselves for their tombs and their monuments, thus securing, so far as in them lay, immortality of a kind. The instances are many; but we need only take the magnificent tomb planned, if not erected, by Henry VII., for himself and his Consort, underneath the too ornate vault of his own chapel annexed to Westminster Abbey. The splendid monument of gilt bronze and marble fashioned by the Florentine Pietro Torrigiano and his assistants needs no new praise, since it is among the most familiar things in London. A still more celebrated monument is that which Pope Julius II. ordered of Michel Angelo; the vicissitudes in connection with the inception and the execution of this great design constituting one of the most curious chapters in the history of the mighty master and of Italian art. We possess, at any rate, if not the complete conception of Buonarroti, three fragments which are among the most famous things in art—the "Moses" in S. Pietro in Vincoli at Rome, and the two so-called "Slaves," in the Renaissance sculpture hall of the Louvre.

A German and a Russian Memorial. ONE of the most celebrated monuments of the later Renaissance — and yet, as a whole, a thing to take warning at, rather than to admire—is the cenotaph of Maximilian I. in the Hofkirche, at Innsbruck, which was not completed until nearly the middle of the seventeenth century. It is a grandiose conception this empty tomb of bronze and marble, guarded on either side by a long row of great bronze figures of kings and heroes. But somehow it has failed in the working out, and what might have been sublime is very nearly ridiculous. A grand monument dedicated to a great monarch is that which the Empress Catherine II. erected to the founder of Russia's position as a world-power, Peter the Great. The eighteenth century, which produced, especially in France, many works of this type of the highest elaboration—chiefly equestrian statues of Louis XIV. and Louis XV., which have long since disappeared in the vortex of the Great Revolution—can show nothing as simple and as expressive as this equestrian statue of the Tsar crushing beneath his horse's hoofs the serpent of conspiracy, and reigning in confidently on the very edge of the rocky precipice. And, strange to say, it is by Etienne Falconnet, the sculptor of the softly voluptuous "Baigneuse," of "L'Amour Menaçant," and other pretty trifling things of the same order.

Modern Monuments. IN modern times—and chiefly within the last fifty years—a whole series of monuments of vast proportions and great material magnificence have been erected to the memory of Sovereigns. He who knows Berlin assuredly knows the splendid "Frederick the Great," erected in 1851—the masterpiece of Rauch. At the side of the Nevski Prospect at St. Petersburg was erected, in 1873, an extensive and sumptuous monument to Catherine II. Here, beneath the colossal full-length statue of the Empress, range themselves nine great figures representing her most eminent coadjutors. Unqualified admiration cannot be extended to the monument erected at Vienna, in 1888, to the Empress Maria-Theresa, from the designs furnished by Zumbusch and Hasenauer. Perhaps the most gigantic, and certainly the most costly, monument that has been dedicated to a deceased sovereign in modern Europe is that which impoverished Italy has erected—but not yet completed—to the memory of King Victor Emmanuel. Already this has, it is estimated, cost something like twenty millions of francs; and this sum is but half, or less than half, of what will have to be expended before the monument can be considered finished. An immense artificial platform rises nearly 80ft. above the Piazza di Venezia, and on this is placed a gigantic equestrian statue of the *Re Galantuomo.* Let it be hoped that the memorial to Queen Victoria will be a credit to the present generation and a worthy specimen of the art which is reviving in our midst.

Keystones.

The West Front of St. Joseph's Church, Brighton, in Elm Grove, has been completed; the staircases, doors, &c., are now more conveniently arranged.

Stockport Infirmary Competition.—On page 107 of our issue for the 13th inst., C. W. Hardy was erroneously printed for Mr. C. W. Harvey, who gained the third premium in this competition.

Hull Royal Infirmary Competition.—Referring to the paragraph on page 127 of our last issue, Messrs. Botterill, Son and Bilson, of Hull, inform us that, though invited to do so, they did not send in a design for this competition.

Midhurst Building By-laws.—At the quarterly meeting of the Midhurst Rural Council it was agreed "That a committee be appointed to consider the advisability of amending the building by-laws, in accordance with suggestions made by the Royal Institute of British Architects."

Ashton Church has been reopened after partial restoration. The roof was in a very bad condition, letting in the water in many places. The windows also let in wind and rain. A plaster ceiling, put up many years after the church was built, had to be removed A very ancient oak ceiling has been thoroughly restored with English oak, and the bosses renewed. Mr. E. C. Ponting was the architect. The work of restoration is not yet completed. About £450 has been already spent.

The Architectural Association of Ireland held its last ordinary meeting of the session, prior to the election of officers in May, last week, the president (Mr. Frederick Batchelor) in the chair. After the election of new members and transaction of general business Mr. R. Caulfield Orpen gave a paper on "Architectural Amenities," or the "pleasurableness" of the profession. Mr. T. E. Hudman proposed a vote of thanks, which Mr. Holloway seconded. Messrs. Shaw (Drogheda), Webb, O'Callaghan, R. M. Butler, and T. P. Sheridan also joined in the discussion.

Libraries given by Mr. Carnegie.—New York City has accepted an offer from Mr. Carnegie to construct sixty-five libraries in Greater New York at an average cost of $80,000, if the municipality will provide the sites and will apportion $500,000 annually for their support. Mr. Carnegie does not stipulate in what parts of the city the buildings are to be located, but it is understood that he desires as many as possible to be placed within easy reach of the labouring classes. There are at present in New York and Brooklyn eighty-five libraries of all kinds.

R.I.B.A. Conditions of Contract.—At the meeting of the Royal Institute of British Architects to be held on April 1st the amendments to the conditions of contract will be considered. The Council, having finally withdrawn from further negotiation with the Institute of Builders, no longer bring forward the amended clauses, published in our issue for December 12th last, with a view to securing a uniform form of contract, but submit them for the consideration of the general body of their members, with the view to such amendments being incorporated in the Royal Institute Form of Contract as may be found desirable.

The Institute of British Decorators.—The annual general meeting of members resident in the northern district of this Institute was held in Leeds last week, when the following were elected officers for the ensuing year:—Chairman, Councillor John Smith (Sheffield); vice-chairmen, Alderman Kendall (Huddersfield); Thomas Preston (Burnley), George G. Laidler (Newcastle-on-Tyne), and George F. Allan (Stockton); treasurer, George Spencer (Bradford); secretary, Thomas Foster (Padiham); committee, Messrs. J. G. Cole (Newcastle); James Tetlow (Huddersfield), John Ratcliffe (Bolton), W. H. Cunliffe (Blackburn), and John Cantrill (Manchester). In order that the objects of the Institute may be promoted, the committee intend to arrange for lectures to be given in some of the principal towns of the northern district next winter.

New Schools for Hadleigh.—We understand that the very Rev. Dean Milburn Blakiston, of the Rectory, Hadleigh, Suffolk, intends building new church schools immediately for Hadleigh. The plans to accommodate 700 children are being prepared by Mr. Arthur H. Ryan-Tenison, A.R.I.B.A., of 7 Great College Street, Westminster, S.W.

The School for the Indigent Blind at St. George's Circus having been acquired by the Waterloo to Baker Street Railway is to be demolished. The nucleus of the present school buildings was erected about 1812. In 1834 additional ground was purchased and the schoolhouse remodelled so as to form a portion of a more extensive edifice in the Tudor or Domestic Gothic style. The designer was Mr. John Newman, F.S.A. A comment on this matter was published on page 37 of our issue for February 20th last.

The Amersham Grove Sunday School in Ludwick Road, New Cross, S.E. has been extended by the addition of a hall 30ft by 19ft., entered from a new porch, and having a small platform; and two smaller class rooms forming an adjunct to the existing large hall, but divided off by curtains from it, and by a panelled wood partition from one another. The contract cost was £710. The architects for the original school and for these additions are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5 Clement's Inn, Strand, W.C.

South Shields Competition. — Mr. John Belcher, A.R.A., the assessor appointed by the South Shields Corporation, has given his award in regard to the 72 plans submitted for the erection of the new municipal buildings on the Ogle Terrace site at a cost of about £30,000. The awards were as follows:—1st, Mr. E. E. Fetch; 2nd, Mr. R. Savage; and 3rd, Mr. Louis Ambler, all of London. The Municipal Buildings Committee of the Corporation have passed a resolution to the effect that Mr. E. E. Fetch be appointed to carry out the works of the buildings subject to the approval of the Town Council.

The Leeds and Yorkshire Architectural Society.—The following have been elected officers of this society for the coming session:—President, Mr. T. Butler Wilson; vice-presidents, Mr. C. B. Howdill and Mr. R. Wood; hon. treasurer, Mr. W. H. Thorp; hon. librarian, Mr. W. H. Beevers; hon. secretary, Mr. H. S. Chorley; council, Messrs. F. W. Bedford, G. F. Bowman, A. E. Dixon, A. Hill, S. D. Kitson, and W. G. Smithson; Messrs. H. Ambler and H. E. Illingworth hon. auditors. Mr. Bedford, it will be noticed, has been succeeded by Mr. Chorley as hon. secretary. The latter's address is 15 Park Row.

A new Bandstand at Bradford is to be erected in Peel Park. Mr. F. E. P. Edwards, A.R.I.B.A., the City Architect, prepared the plans which provide for a larger structure than the present one. It will be 24ft. in diameter, and it will be raised upon a stone base nearly 4ft. above the ground. The new stand will be provided with a convex sounding-board of pitch pine beneath the roof inside. In shape the new stand is to be a decagonal structure of light appearance, with a roof supported by ornamented cast-iron pillars. The cost of the stand, the boundary wall, and the two flights of steps will be about £460.

Housing in Dudley.—A Local Government Board Inquiry was held recently into the application by the Dudley Town Council to borrow £5,071 for various street improvements, &c. Of the amount £706 is to be devoted to making two new streets on the Buffery estate, and £3,700 to purchasing property at the corner of Wolverhampton and High Streets. The property at the corner of the two streets named was acquired to relieve a very congested place, and cost £3,600. The two streets on the Buffery estate are being made on condition that the landowner gave up a piece of land for the benefit of the recreation ground, and that he would erect 50 houses on the estate. It is hoped that eventually 200 houses will be built there at rents of 5s. 6d. or 6s. a week.

New Patents.

These patents are open to opposition until April 27th.

1900.—Smoke-consuming Firegrates.—6,891. W. H. Sharp, 29 Russell Terrace, Enfield. This invention relates to a fire-grate which is fed by coal or other fuel being inserted at the bottom, instead of on the top of the fire. This is made possible by a "comb" and a "lift." The former is pulled out from behind the grate, the fuel is laid on it, and is then raised by the "lift." It is a special feature of the device that the parts may be packed in a small compass for shipment.

Drain-testing Apparatus. — 11,222. R. Ravenor, Speenhamland, Newbury, Berks. The object of this invention is to enable smoke rockets to be used effectively without danger of exploding any unconsumed gas emitted from the rocket, and also to enable testing with air and smoke, separately or combined, to be carried out at high or low pressure. The usual blowing apparatus is employed, but immediately below the rocket, when in position, there is a receptacle holding water, so arranged as to catch and extinguish any sparks that may be emitted. A number of rockets can be fired sequentially without disturbing the connection with the drain. The apparatus is very compact and portable.

Door Stops.—17,729. J. Cook, 98 Market Street, Chorley, Lancs. When doors are flung open it sometimes happens that the key or handle hits the wall and breaks the plaster or other surface. To prevent this a suitable resilient stop is fixed to the skirting board.

Treads for Staircases.—20,732. A R. Robinson, 12 Norfolk Street, Strand, W.C. The treads of staircases, being subject to the most wear, naturally waste first According to this invention, which has special reference to stone and concrete staircases, dovetail grooves are made in the top of each step and filled with wood strips. To these the treads proper are fixed with screws, being preferably arranged in sections so that any portion which is worn may be easily replaced.

The following specifications were published on Saturday last, and are open to opposition until May 6th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—4,173, Cameron, Commin and Martin, apparatus for the treatment and disposal of sewage. 4,260, Hicks, automatic gas lighting. 4,301, Bromfield, gates. 5,817, Javal, apparatus for generating acetylene gas. 5.852 Green, seat standards for water-closets. 6 343, Pollard, Pollard and Pollard, chimney cowls. 7 096, Grünberg, apparatus for producing artificial stone free from air. 7,657, Burbey, cord grips for electric-lamp holders, ceiling roses, &c. 7.833, Tannett-Walker, travelling cranes. 7 904, Brazier, valves or valve casings for ball cocks of cisterns. 7.997, Kammerer, electric gear for cranes. 10.591, Sieverts, incandescent gas-burners. 12,581, Talbot, means for lighting incandescent lamps. 14,485, Bennett and Jones, system of automatically lighting gas-burners. 15 225, Bremer, electric arc lamps. 17 632, Kaufmann, tripod stands for theodolites. 18,947, Deike, Mitchell and Alexander, acetylene gas-generating machines. 20,778, Heany, electric arc lamps. 20.779, Heany, electric arc lamps. 21,830, Morley, automatic fire-lighting apparatus. 22.585, Brewster, flexible supporting structures for electric lamps. 23,245, Howorth (*O. Titel and Wolde*), purification of the air of rooms. 23 599, Lester, smoke consumers.

1901.—51, Göhler, gas producing apparatus. 683, Hemming, drying sheds for bricks.

A new Congregational Church at Ilford has been erected at a cost of about £10,000. The peculiarity of the church is that it is built in octagonal form, supported on eight pillars. There is a very lofty dome roof, weighing one hundred tons.

Engineering Notes.

The Extensions to the Grimsby Workhouse Infirmary are being warmed and ventilated by Messrs. E. H. Shorland and Brother, of Manchester.

Bethany Church, Port Talbot, has been fitted by Messrs. John King, Ltd., engineers, of Liverpool, with their well-known "small tube" hot-water heating apparatus.

Richmond and Electric Tramways. — The London United Tramways Company have offered to the Richmond Corporation in consideration of their assent to the Bill to enable the company, among other things, to construct electric tramways from Richmond to Hammersmith, that they will not insist on establishing the overhead system in Richmond, but will allow the Council to decide what system shall be adopted. The company also offer to carry out street widenings in the borough at a cost of £30,000.

Openings for Electrical Engineers in Spain.—Mr. Harrison, commercial attaché to the British Embassy at Madrid, says in his report on the trade of Spain that the many openings in the electrical business in Spain are just what are necessary for young men to fit themselves for more important posts. Young English engineers and mechanics who would not object to pass a few years in quiet towns and villages would probably find ready employment under some of the great firms interested in the electric-light business. Avoid Madrid, says Mr. Harrison, for it offers few openings for foreigners, but go to any other town in Spain.

George's Dock Improvements, Liverpool.—The scheme for continuing Water Street across the George's Dock site has been entered upon, and the extension, which is to be 80ft. wide and about 320ft. long, will undoubtedly be completed by September next. The roadway will be supported on concrete piers and arches, the foundation for the piers being carried down through the clay to the solid rock. Under the supervision of the city engineer excellent progress has been made with the work below the level of the bottom of the dock, but it is not intended to start operations above the level of the dock bottom until all risk of damage to the concrete from severe frost has disappeared. It may also be mentioned that it has been decided to so construct the piers and archways underneath the roadway as to provide a tank for the storage of, say, two million gallons of salt water, impounded from the Mersey for use in connection with the Corporation bathing establishments.

London Water Supply: Deputation to Mr. Walter Long.—On Thursday last a deputation from the London County Council waited upon Mr. Walter Long, the President of the Local Government Board, in order to lay before him a resolution passed by the Council that the Government should allow the Council's Purchase Bill to pass second reading, and to be referred to a Committee of Parliament. Mr. Long said he deeply regretted that the Council had not accepted the recommendations of the Royal Commission, instead of standing by the Bill which was now in Parliament. He did not see how he could ask the House of Commons to pass that Bill, nor did he see that he could ask the Government to remain silent when the Bill came before the House. His decision was the result of careful consideration, and he was very sorry that a *modus vivendi* had not been found between the companies and the Council. Under the circumstances, he saw nothing to justify him in altering the opinions he expressed when he last met them.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.		WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED
		BUILDING.		
Mar.	29	Heath Town—Extending School	Wednesfield School Board	F. H. Lynes, Gresham Chambers, Lichfield Street, Wolverhampton.

CONTRACTS OPEN.

HAMBLEDON RURAL DISTRICT COUNCIL.

TO SEWER CONTRACTORS.

The above-named Council invite TENDERS for (a) About one thousand lineal yards of 12in. OUTFALL SEWER, with Manholes and other incidentals; and (b) The CONSTRUCTION of SEWAGE PURIFICATION WORKS at Cranleigh, Surrey.

The plans can be seen on application to the Surveyor Mr. EDWARD L. LUNN, at his Offices, 36 High Street, Guildford.

Intending competitors are requested to send in their names to the said surveyor, and to deposit with him the sum of £3 3s., on or before WEDNESDAY, APRIL 3rd. now next ensuing. A copy of the specification, bills of quantities, and a form of Tender will then be sent to them.

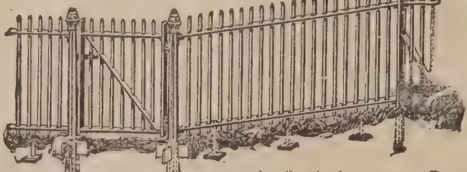
The deposit will be returned to all those who send in a bonâ-fide Tender, accompanied by the specification and schedule, unless the Tender be subsequently withdrawn, in which case the deposit shall be deemed to have been forfeited.

Sealed and endorsed Tenders in the form prescribed are to be sent in to me here not later than TWO o'clock p.m. on WEDNESDAY, APRIL 17th, 1901.

The Council do not bind themselves to accept the lowest or any Tender.

FERDINAND SMALLPLIN,
Clerk to the said Council,

No. 128 High Street, Guildford,
March 1901.



Can be fixed close up to Purchaser's boundary, and suits rise or fall in the ground.

GLASGOW ARCHITECTURAL ASSOCIATION. — Mr. Stephen Adam on "Colour in Decoration."

CARDIFF, SOUTH WALES AND MONMOUTHSHIRE ARCHITECTS' SOCIETY.—Meeting.

Wednesday, April 3.

RUSKIN SOCIETY of BIRMINGHAM.—Annual meeting at 8 p.m.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Meeting at 8 p.m.

GEOLOGICAL SOCIETY OF LONDON. — Meeting at 8 p.m

SANITARY INSTITUTE.—Lectures and Demonstrations for Sanitary Officers, Part II — Mr. W. Hunting, F.R.C.V.S., on "Practical Methods of Stalling and Slaughtering Animals."

Workmen's Houses at Wellington. — Mr. Fleming, architect, of Wolverhampton, has prepared plans for workmen's dwellings which have been adopted by the Wellington Urban District Council, which proposes to apply to the Local Government Board for permission to borrow £4,200 to buy land and erect the first lot of houses.

Coal Smoke Abatement Society. — In the annual report for the year ended December 31st, 1900, attention is drawn to the fact that since the formation of this society in March, 1899, no fewer than 2,700 observations have been made by the society's inspector on smokey chimneys in various parts of London; offences have been proved in 162 cases, and penalties have been inflicted, amounting altogether to the large sum of £750, of which many have been of small amount. A larger income is urgently needed to carry on and extend the scope of the society's work. Subscriptions should be sent to the hon. treasurer, Dr. Des Voeux, 14 Buckingham Gate, S.W., and any further information required will be given on application to the secretary, at the offices of the society, 59 Chancery Lane, W.C. The committee have written to the various borough councils of London, suggesting that, wherever occasion arises, the councils should specify for some form of the grates and stoves already in the market designed materially to reduce the evil of imperfect combustion being used in buildings under their control. The society have made a similar suggestion to her late Majesty's Government and to the London School Board, which has been received by them with a promise to put it in operation without delay, and whenever possible, and even to furnish facilities for trials in order to ascertain the best form of smokeless grate for the purpose.

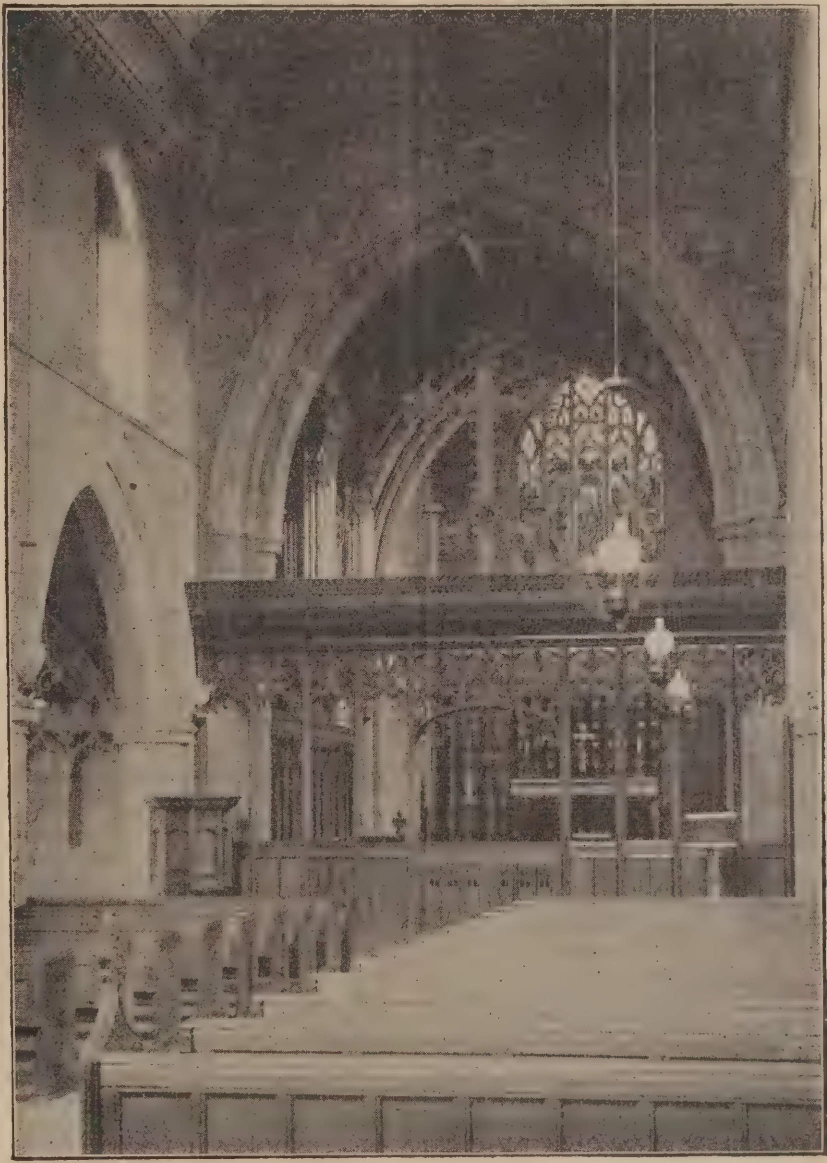
An Architectural Causerie.

The Victoria Memorial. THE statement has been circulated in the daily press that Mr. T. G. Jackson, Mr. Aston Webb, Mr. Ernest George, Sir Thomas Drew and Dr. Rowand Anderson have been invited to submit designs for the Queen Victoria Memorial, and that these designs are to be in the Office of Works by the end of June. If true, we much regret this decision. We have already expressed the opinion that this memorial should be the subject of an imperial competition among British architects: to restrict it to five men, who, though giants professionally, do not represent the sum-total of our architecture, is both unfair and impolitic. In cases where planning or some special requirements are all important, it is often desirable to invite designs from a few men who are professedly specialists in these particular branches, but with this memorial no such conditions obtain. Planning will be practically non-existent: the memorial will be, as Mr. Balfour remarked, an artistic and not a utilitarian structure. We therefore consider it a great mistake to exclude the profession by only selecting five of its members, prominent though they be; and we hope that sufficient protest will be lodged against this proposal to negative it.

St. Mary's Church, Stretton, near Burton-on-Trent. THIS church was begun in 1895 and consecrated in November, 1897. It takes the place of a very inferior church built about sixty years ago. The new church was the gift of the late Mr. John Gretton to his native village. It consists of a nave with aisles, a chancel with a chapel on the south and a transept containing the organ on the north, with a central tower. The building is all of ashlar, the inside being of red Runcorn stone and the outside hard sandstone from Stanton, near Ashbourne. The church was consecrated with all its furniture and decorations complete, except the painted glass in the two side windows of the sanctuary, which was put in a few months later. In the opinion of the architects (Messrs. J. T. Micklethwaite and Somers Clarke) these windows and the east window are all that require painted glass; but the chapel is being treated separately, and is now having its windows filled in memory of the founder. The church is seated for 280 persons and cost rather more than £30,000. Our illustration is from a photograph taken by Mr. W. Weir, who was clerk of works at the completion of the building.



STRETTON CHURCH, STAFFORDSHIRE. J. T. MICKLETHWAITE AND SOMERS CLARKE, ARCHITECTS.

The Level of London. A STATESMAN addressing the House of Commons once spoke of "levelling up" the conflicting Churches of Ireland. The phrase became popular like many more because it gave expression to an idea for the first time in words. Levelling is usually associated with bringing down, but here it means raising up to one standard. A process of levelling up has been going on for ages in great cities. Rome is a case in point. Originally built by a band of fugitives or outlaws, the site in the first instance was dictated merely by considerations of safety. The great plain of the Campagna is considerably above the coast level; at a point where it breaks abruptly down into a lower plain, extending a few miles farther to the sea, they built their settlement, possibly, it is thought, amongst the ruins of an older city, for recent discoveries have revealed Cyclopean masonry far below the supposed foundations of the town, and evidently the work of an earlier race. Gradually the level of the city rose. The Empire came and went; the Middle Age succeeded, and the remains of Roman palaces and baths were used as foundations for new buildings, a quantity of valuable material being crushed into an indistinguishable mass. Neglect and the shrinking of the population led to the partial covering of many structures by the soil, until in our own day the traveller who visits "the ruins of ancient Rome" finds, after driving through the modern city, that he looks *down* upon them. The rule applies to all great cities. London was originally a little Celtic settlement upon Ludgate Hill, which rose over a vast marsh; hence its name Lun Dyn—the lake fort. The inequalities of London's surface lasted long: it is only a few years ago that the construction of the Holborn Viaduct opened a level road from the West End to the City; and many men remember the descent of "Holborn Hill" and the climb up "Snow Hill," the numerous accidents in bad weather, and the scene when the ground was slippery with frost, and horses, men and omnibuses went down. In the City the results of "levelling up" are greater convenience and more orderly and straighter streets, but a loss of picturesque effect which can only be appreciated by consulting old prints and drawings of London. After the Great Fire in 1666, when Wren began to rebuild the Cathedral and many churches and other buildings, the town was still a smouldering mass of charred ruins. Drawings of the last century show us his London rising steeply from the water to the hills behind; London Bridge, the successor of the old wooden structure, but much lower than the existing one; whilst his towers, cupolas and steeples stand sharply out, high above the mass of the town. Now all is changed. Immense structures, great railway stations, towering warehouses and blocks of offices have reduced the apparent height of his towers. Standing near the Fishmongers' Hall we look *down* over the parapet upon the entrance to Wren's church of St. Magnus; yet it was past its doors that the stream of traffic then ran to the older bridge. London has risen many feet since then.

MEN WHO BUILD.

No. 63.—E. GUY DAWBER.

TIMES of transition are always times of anxiety. English architecture is in a transition state to-day, and it therefore behoves all who are responsible for it to see that they do not play false to their trust. We are emerging from the shadow of dead mediocrity into the fuller light of fresh and sane design, but amidst this transit one hears the conflicting cries of many self-styled leaders, each clamouring for a band to guide into the land of milk and honey. That this land of milk and honey should seem to lie in so many places at once is no surprise, considering the circumstances; yet it should be the duty of everyone to see that he is not blindly following a crowd, but cognisant of his whereabouts and honestly endeavouring to make the best of the position in which he finds himself.

In the olden days the buildings, furniture and decoration possessed a charm which the generality of modern work lacks—a charm which we designate with that ill-definable word "beautiful."

Those days, however, had their own conditions, which are not ours, and it is a foolish affectation to mimic them. What, for example, more unwarrantable than to duplicate old oaken chairs, biting the surface of the wood by means of ammonical fumes in order to forge the wear of Time: or perhaps employing a shot-gun for the purpose of producing worm holes? We might just as well take a hose-pipe and some acid water and play upon our houses in order that sharp angles might be rounded and straight lines broken. But while such duplication of ancient work is indefensible there is every reason to apply to our present creations so much of the principles and methods which made the old work beautiful; and in nothing is this more proper than when concerned with the planning, design and decoration of country houses.

As such a designer, Mr. E. Guy Dawber is most happy in his results, as some of his work which we illustrate will serve to show.

His houses have a quiet simplicity about them which is a great relief from the fussy, restless erections to which, alas! we are so accustomed. Without belonging to that extreme school which thinks of the Middle Ages as a kind of artistic millennium, and goes into preconceived raptures over everything which is not modern, one can appreciate those old panelled rooms, those delightful windows which peer out in unexpected places, and those cosy nooks where one may sit secluded, and it is the spirit which produced them that one desires to see embodied in the houses of our own times. Mr. Dawber's designs show how successfully this can be done: for whilst eschewing all slavish reproduction of old models, he yet endeavours by simple and straightforward means to obtain much of the pleasing and homely effect so noticeable in the work of bygone days. Mr. Dawber is also one of those who believe that the planning of the garden and of the house should as far as possible be done by the same hand, though he holds that the architect should not meander off into by-paths not properly within his sphere.

With this preface of the general tenor of his work we may now give some particulars of his career.

Mr. Dawber was born at King's Lynn, in Norfolk, and served his articles in the same town. It was here, amongst its wealth of domestic and ecclesiastical architecture, that he became imbued with that love of sketching and studying old work which has never ceased to interest him. Upon the expiration of his articles, in 1881, he entered the office of the late Sir Thomas Newenham Deane in Dublin, and after a year in that city (during the troublous times of the Land League and the consequent stagnation of almost every business) came to London and into the office of Messrs. Ernest George and Peto.

Entering the Royal Academy Schools in 1883, he gained the Lower School Premium in 1884 and the Upper School Premium in 1885, competing the same year for the Gold Medal.

Incessant work during the day time and in the evenings telling upon his eyes, he in 1886 acted as clerk of works for Messrs. Ernest George and Peto on a house in Cadogan Square, and in 1887 went in the same capacity to supervise for them the building of Batsford, in Gloucestershire, until 1890, when he commenced to practise on his own account in the little village of Bourton-on-the-Hill. It was during the years Mr. Dawber was in Gloucestershire that he studied and sketched in almost every village in the Cotswolds within reach and so gained the intimate knowledge of this most interesting district which he now possesses.

His work commenced with the remodelling and extensive alteration of a large mansion, which led rapidly to other works of a similar kind, until now there are many houses in the neighbourhood that bear the impress of his handiwork.

In 1891 he came to London again and continued his practice at 22 Buckingham Street, Adelphi, W.C., where he has been ever since. In 1897, Mr. F. A. Whitwell joined him in a partnership, which terminated in June last year. At the present time he is doing work (and has done so for some time past) in nearly a dozen counties in different parts of England, besides much in London and neighbourhood.

The following are some particulars of the accompanying illustrations, which include the chief work which Mr. Dawber has carried out:—

St. John's Chapel, Matlock.—Built on the slope of the hill, high above the valley, with a stream running through the rock below it. The idea of water has been symbolised throughout the decoration. The coloured east window is by Mr. Louis Davis, the figures around the pulpit by Mr. Cecil Fabian, the plaster ceiling by Mr. George Bankart, the decorations and painted altar-piece by Mr. John Cooke. The interior decorations are not yet complete. Care was taken in designing this delightful little chapel to make it appear to grow naturally out of the wall below and to get the effect of clinging to the side of the hill. The result was most successful.

The Court House, Broadway, Worcestershire.—This, which is practically a new house—a fragment of an old gateway only remaining—was built of stonework and slating from old barns and buildings taken down. It is in the quiet Cotswold manner and contains plaster ceilings by Mr. George Bankart and panelled halls and stairs, &c.

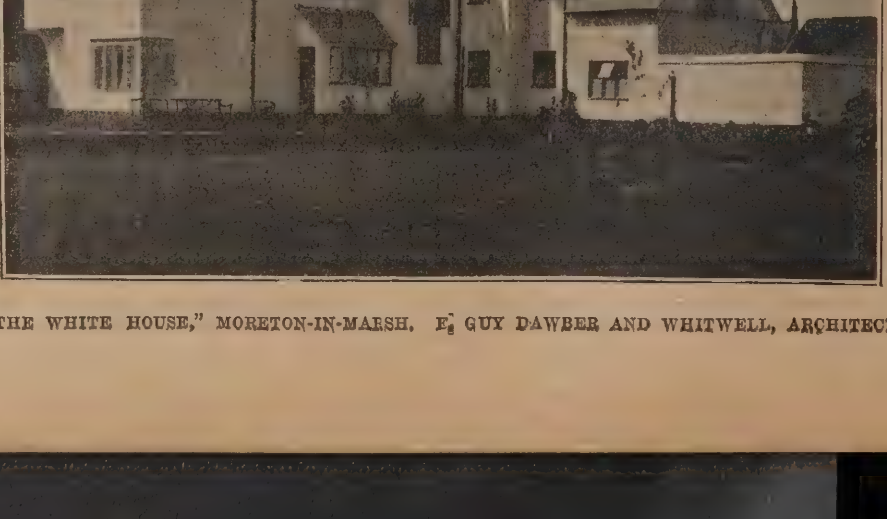
The Post Office, Broadway, Worcestershire.—In the main street, and an endeavour to treat this class of building, generally so conventional and official in aspect, in sympathy with its surroundings. A feature is made of the bay window, which is carried up two storeys. Mr. Dawber has also done much other work in this village.

House at Cley, Norfolk.—This house is built of flint and brick in the local manner, with mullioned windows and leaded panes, and stands on the slope of a hill overlooking the wide valley of the Glave; opposite are Blakeney and Glandford Churches, and away on the right, over the quaint old-world village of Cley, is the sea. The dining-room here is panelled from floor to ceiling with fine oak, saved many years ago from an old house in the village which fell into ruins. The roof is covered with red pantiles, and the house is surrounded by a garden with terraces and sunk lawns, following the slope of the hill ground.

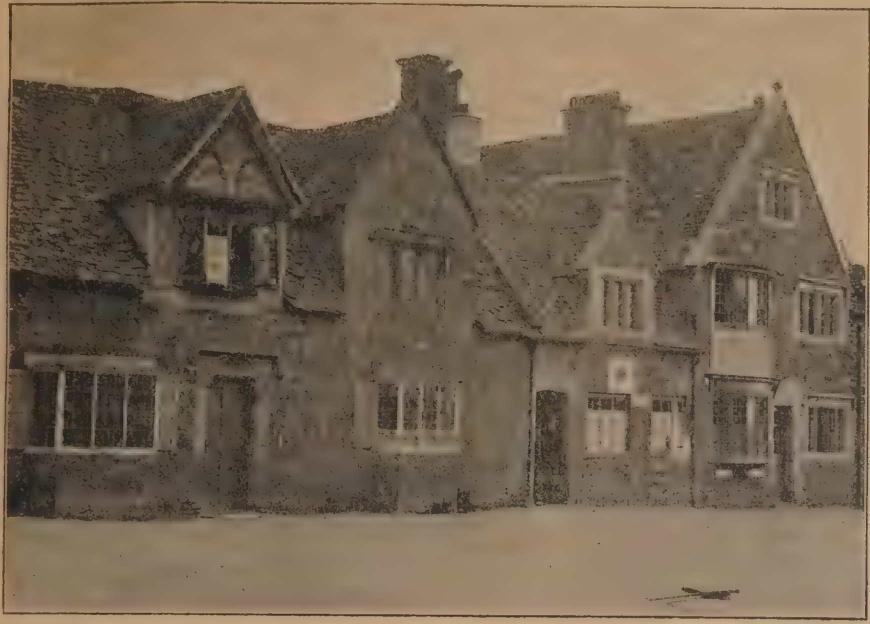
The White House, Moreton-in-Marsh, Gloucestershire.—This little house, built a few years ago for a doctor, is in brick rough-casted, with a high tarred base and a roof of Cotswold stone slates. It is quiet and unobtrusive, and with the stables and outbuildings adjoining forms a cheery group at the entrance to the town. It is close to the railway station, and the gardens, laid out and planned by the architect, are enclosed by a high wall.

Village Schools, Stow-on-the-Wold, Gloucestershire.—These, again, are built in the local manner, with stone walling, stone-slate roof, mullioned windows and lead lights.

Donnington Hurst, Newbury, is picturesquely situated on a site of about fifteen acres, between two woods, the entrance-drive being taken through the one behind the house. The site sloped very much, so that



"THE WHITE HOUSE," MORETON-IN-MARSH. E. GUY DAWBER AND WHITWELL, ARCHITECTS.



THE POST-OFFICE, BROADWAY, WORCESTERSHIRE. E. GUY DAWBER, ARCHITECT.

considerable making-up of terraces and lawns was needed. All the gardens, terraces, lawns, pergolas, steps, &c., were designed by Mr. Dawber, and the house itself is very pleasing. It is quiet and simple. There is no striving for ornamentation or ostenatious display, and the effect is reposeful. The walls are partly of brick and partly rough-casted, and the roofs are tiled, with the chimneys in thin red facing-bricks. The windows are mullioned and have lead lights. The whole of the ceilings to the ground floor are treated with modelled plaster by Mr. Bankart, and the continous treatment—no one room being more ornate than another—is very charming. The hall is panelled, opening with folding doors into the parlour, giving a very pleasing vista with the garden beyond, and with its wide stone fireplace carried up to the ceiling is very effective. The window-curtains, &c., all tone in with the scheme, and were obtained from Germany, being simply the delightful red and white, and blue and white checks one sees used so successfully in cottages and houses abroad. All the walls throughout are kept white. Here is a house where, with simple everyday materials and a comparatively small outlay, a good effect has been gained. The only features, so to speak, are in the planning and detail of the building itself and in its ceilings, &c. It is about two or three miles out of Newbury, and forms one of a series of houses which Mr. Dawber is now building in various parts of England.

One of the chief specialities of Mr. Dawber's work consists in altering and adding to large country houses, in numerous instances entailing practically the entire remodelling—a species of work that is very interesting, though somewhat unsatisfactory. But whilst the architect is more or less fettered on the outside, he has free scope for his powers with the interior, and Mr. Dawber has not hesitaied to avail himself of his opportunities.

"*Hartpury*," *Gloucestershire*, is full of rich work and decoration. The ceilings throughout were executed by Mr. Bankart, and oak is freely used for panelling in all the chief rooms. The business room is panelled in cedar, from trees cut some years ago on the estate. The drawing-room, with its barrelled plaster ceiling, white panelling and silk hangings, mahogany doors and polished floor, is a very fine room; the candelabra, designed by Mr. Dawber, were made by Mr. Shirley, of Rathbone Place. The brass masks in the billiard-room chimney-piece were modelled and cast by Mr. Stirling Lee, the culptor. The work was commenced about seven years ago and is still going on, the ining-room having had a very rich ceiling, by Mr. Bankart, put in only last year, when the himney-piece and panelling were also fixed in the same room; the former, about 11ft. wide and 9ft. high, is a very rich piece of work, with a portrait in the centre over the fireplace.

Itton Court, Monmouthshire.—Another large house altered and added to by Mr. Dawber about eight years ago, when at the same time stables, lodges, &c., were built. The gardens, terraces, pergolas, &c., are now being carried out under the architect's superintendence, and cottages, &c., are being erected.

Amongst other houses which Mr. Dawber has remodelled and added to may be mentioned the following:—

Springhill Mansion, Worcestershire; Beachley Lodge and *Ebrington Hall*, both in *Gloucestershire; Norton Hall, Gloucestershire; Barton House, Warwickshire; The Manor House, Bourton-on-the-Water, Gloucestershire; Broadwell Manor, Gloucestershire; Lemington Manor, Gloucestershire; Middle Hill, Worcestershire; Todenham House, Gloucestershire; Austin House, Worcestershire; Bowood, Wiltshire; Chadshunt, Warwickshire;* and many others too numerous to mention, besides much miscellaneous work in different parts of the country.

Cottages, Matlock Dale.—These three cottages, built a few years ago, overlook the lovely valley of the Derwent. They are in stone and rough-cast but call for no particular comment, except that as an investment they pay over 6 per cent interest on the outlay.

Mr. Dawber is an enthusiastic sketcher in water-colours (we reproduce three of his sketches) and a keen collector and connoisseur of old furniture, chiefly examples of eighteenth-century English work—he has written much on the subject in "Architecture," the "Architectural Review" and various papers, but at the same time has a very great admiration for some of the really good simply-designed modern work.

Mr. Dawber is deeply interested in the "cottage problem" now attracting so much attention, and has built many in different parts of the country, but he feels that if good, simple building is to be done in country districts many of the present restrictive building by-laws will need to be abolished, and in this connection it may be mentioned that he was one of the deputation recently appointed by the Royal Institute of British Architects to wait on Mr. Grant Lawson, parliamentary secretary to the Local Government Board, with a view to securing some revision of the existing by-laws.

In the design of houses Mr. Dawber has shown what successful results are obtainable in skilled hands, and it is much to be desired that houses of similar merit were more common. When they are the status of our architecture will have improved considerably, and the men who now fill our suburbs with so many "desirable villas" will fast be losing their power.

ARCHITECTURAL ASSOCIATION.

SMALL SUBURBAN HOUSES.

By H. D. SEARLES WOOD and H. R. APPELBEE.

A MEETING of the Association took place last Friday evening, when Mr. Henry T. Hare, F.R.I.B.A., was in the chair. Messrs. W. Boyd, E. R. Sladen, H. Lawrence and H. Prince having been elected members of the Association, the following preliminary House List was read, it being open till the next meeting for other names to be nominated:—*President*, Mr. W. Howard Seth-Smith; *Vice-Presidents*, Messrs. G. B. Carvill and E. Guy Dawber; *Committee*, Messrs. H. R. Appelbee, C. H. F. Comyn, A. C. Dickie, R. H. Weymouth, F. D. Clapham, W. H. Raffles, W. A. Pite, A. H..

ARCHITECTS.

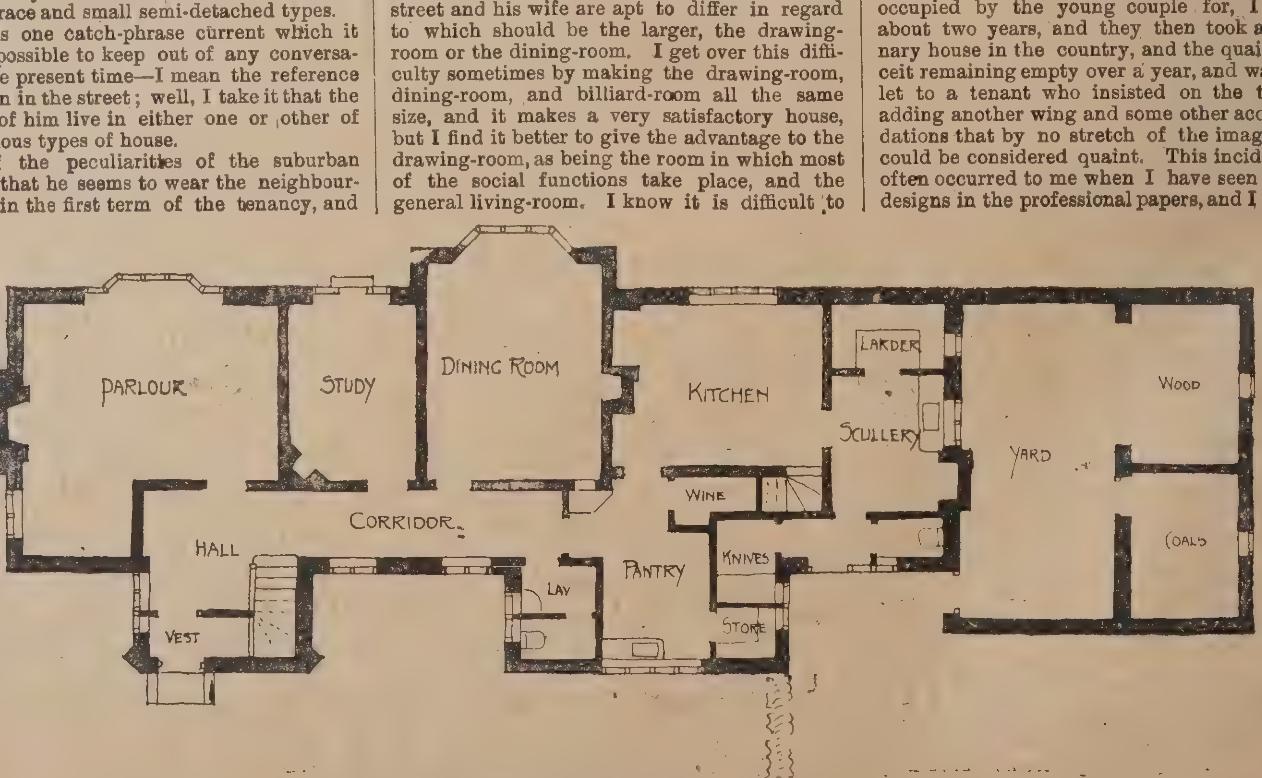
Goslett, W. J. Tapper, Hon. A. McGarel Hogg, L. Ambler, A. T. Bolton, W. A. Forsyth, H. T. Hare, Arnold Mitchell, G. H. Fellowes Prynne, and E. Howley Sim; *Hon. Treasurer*, Mr. F. G. F. Hooper; *Hon. Librarian*, Mr. F. J. Osborne Smith; *Assistant Librarians*, Messrs. C. H. F. Comyn and W. A. Jeckells; *Hon. Secretaries*, Messrs. R. S. Balfour and and H. P. G. Maule; *Honoray Auditors*, Messrs. E. Greenop and G. M. Nicholson; *Hon. Solicitor*, Mr. W. H. Jamieson; and *Secretary and Registrar*, Mr. D. G. Driver. Mr. Searles Wood then read his paper as follows:—

I have no idea how the Committee intended this subject to be divided between Mr. Appelbee and myself, but, as I suppose the most useful purpose would be served by each of us speaking from his own experience the things that he has learnt, I propose to deal with houses of the rental value of from 80*l.* to 200*l.*, Mr. Appelbee having kindly undertaken to treat on houses of the terrace and small semi-detached types.

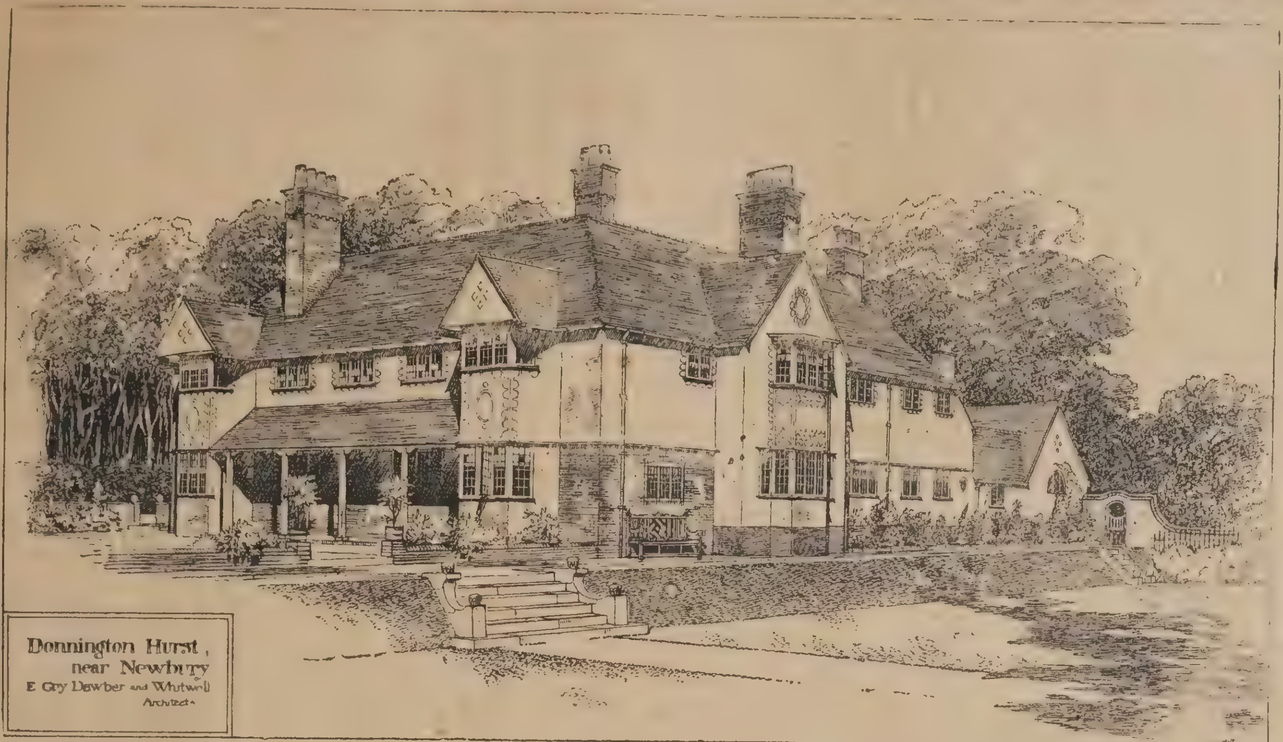
There is one catch-phrase current which it seems impossible to keep out of any conversation at the present time—I mean the reference to the man in the street; well, I take it that the majority of him live in either one or other of these various types of house.

One of the peculiarities of the suburban tenant is that he seems to wear the neighbourhood out in the first term of the tenancy, and it thus happens that the oldest inhabitant in most suburbs has been in occupation about seven years. Now, this being the case, it is obvious that in planning these houses they must be designed to suit the multitude, and not individual tastes.

The man in the street is a man of social habits, with a fairly large circle of acquaintances. Let us take a typical family, consisting of the father and mother, with a grown-up family of four, two boys and two girls—the father and two boys playing golf and billiards, the mother and girls devoted to cards. Now, what should be the proportion of the various rooms to suit such a family, supposing we fix the rent at 200*l.*, and give an acre and a half of ground at 25*l.* per acre per annum. This leaves in round figures 3,000*l.* on a 5 per cent. basis as the cost of the house. The relative size of the several reception-rooms is the first consideration. The views of the man in the street and his wife are apt to differ in regard to which should be the larger, the drawing-room or the dining-room. I get over this difficulty sometimes by making the drawing-room, dining-room, and billiard-room all the same size, and it makes a very satisfactory house, but I find it better to give the advantage to the drawing-room, as being the room in which most of the social functions take place, and the general living-room. I know it is difficult to convince the mere man that this is the case My experience is that in the inevitable compromise the drawing-room comes out the larger room. In houses of this kind I find that the luxury of a large hall cannot be afforded; it is a beautiful feature in large houses, but where it can only be obtained by the sacrifice of size in the dining-room and drawing-room, I am convinced it does not pay. (I generally lay a parquet floor in the drawing-room, though nowadays dances are generally given in the various public halls that are found in most suburban districts.) I had some few years ago to advise trustees as to advancing their money to build a small house for a young couple who were just married, who thought they would like a quaint little house built out of the wife's trust money. When the plans were submitted to me I reported that in the event of the house being to let considerable additions would have to be made. In spite of my advice the house was built and occupied by the young couple for, I think, about two years, and they then took an ordinary house in the country, and the quaint conceit remaining empty over a year, and was then let to a tenant who insisted on the trustees adding another wing and some other accommodations that by no stretch of the imagination could be considered quaint. This incident has often occurred to me when I have seen similar designs in the professional papers, and I wonder



GROUND PLAN, HOUSE AT CLEY, NORFOLK.



what alterations will be made in the course of time, and such thoughts as these have a chastening influence whenever I feel disposed to attempt the unusual. I hope I shall not be misunderstood. I have a great admiration for the work of many of our talented architects whose houses will always interest, but small suburban houses must to a certain extent follow the more or less stereotyped plan which, after all, is the concentrated experience of many generations of builders.

I personally have a great objection to that form of hall which consists of a passage from the front to the back of the house. It quite, to to my mind, destroys the comfort of the hall, and in small houses I think what is called the garden entrance is unnecessary. I like also, if possible, to shut off the staircase from the hall.

The position of the billiard-room in relation to the house wants careful consideration. I always try and make a separate approach to the billiard-room from the outside. In the suburbs it is usual to have certain evenings in the week for billiards, when it is understood that your friends will drop in without a special invitation for a friendly game, or to play in a handicap. If there is a separate entrance these visitors can come into the room without disturbing the other members of the family, and can leave without rousing the household if the billiard-room is kept open late. It always seems to me that a billiard-room in a small house such as we are now considering is an expensive feature if you look at it in the light of its being the largest reception-room in the house being devoted to a game which on the average is not played for more than four hours a week. To obviate this, I have found Burnett's patent machinery for lowering the table into a pit and allowing a floor to be laid over the space makes this room available for other purposes of entertainment. This machine consists of four screws which work in a steel frame, and are connected by means of bevel cogs so as to all work together and thus prevent the travelling table jambing; the screws bring the table up to the steel bed plate, and the table comes up each time to a dead level. When the table is lowered a beam of oak is laid across the opening and the flooring, made in convenient widths, is laid on the beam and the ends caught by a hinged board secured with cups and screws which hold the false floor in its place. It takes about twenty minutes to get the table down and the false floor laid, and about thirty minutes to get the table back again and the false floor stowed away in the pit.

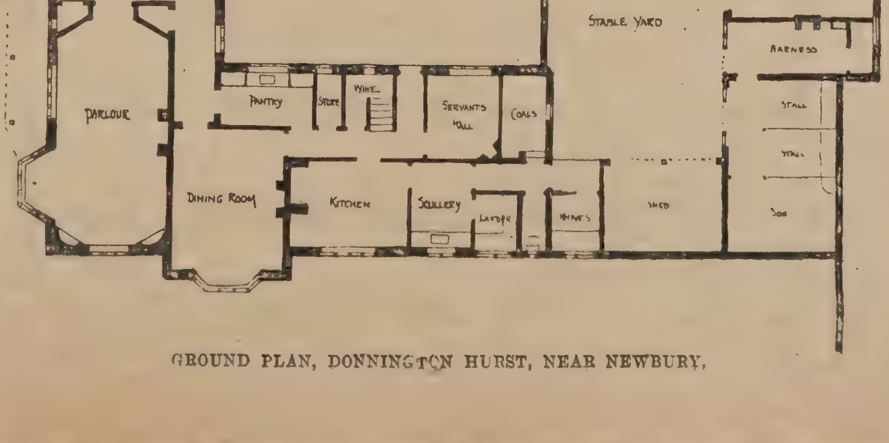
I find it suits the man in the street to give him a dining-room, drawing-room, and billiard-room, the last taking the place of the small sitting-room usually called the morning-room or library on the ground floor. The billiard-room in this case has usually a writing-desk in it where the men of the family do what writing they have to do, and, in fact, use it as a general morning-room. This room should always be heated by hot-water pipes. Nothing is more miserable than to go into a cold billiard-room after dinner, and the open fire is apt to make one set of cushions softer than the others. If this plan is adopted the ladies want a room upstairs for work, and this can often conveniently be made in the attic, and when so placed piano or violin practice can be indulged in without fear for the feelings of the rest of the household.

The relative position of the kitchen to the dining-room is another point which regulates the plan to a great extent so as to avoid as much as possible having to cross the house in serving the meals; but it is a moot point whether, in the sized dining-rooms that are usual in the class of house under consideration, two doors—one from the hall and one from the service passage—are not more conducive to draught than the convenience of the service warrants. But I am not in favour of hatches.

The dining-room should never be less than 15 ft. wide for the convenience of serving round the table. A recessed fireplace on the side is also a pleasant feature, and gives interest to the room.

The kitchen should be so placed that the housemaid's pantry can be reached without passing through the kitchen. This pantry should be as large as possible, and all the glass and silver should be washed and cleaned in it.

The kitchen should also be a good size. It should be remembered that, in addition to the work of preparing the food, it is the living-room of the servants. It is not usual, in houses of the size we are considering, to provide a servants' hall, and therefore the kitchen should be made larger to suit the double purpose. Good light on the right-hand of the range is very important, and a cheerful outlook, if possible. In these houses I always make the boilers in the ranges of the kitchen and scullery both work the hot-water system, so that when in the summer the cooking is done on the smaller range, there is still a circulation of hot water over the house. I find it a good plan also to have a copper cylinder on the flow on the first floor as well as the hot tank in the



GROUND PLAN, DONNINGTON HURST, NEAR NEWBURY.

cistern room. This cylinder heats the linen-closet and gives a good storage of hot water

If the family are given to taking cold baths in the morning there is a great run on the bath-room, and I find that a second bathroom is a good feature, if possible; but if not, a spray bath on the head of the slipper bath enables the bath to be used much more quickly.

The staircase is one of the few opportunities in a house of this character that offer scope for a little careful detail. Of the three types of stairs—the open well, the dog leg, and the stairs between walls—I fancy the last gives a little more mystery to the planning, the upper floor not being disclosed until the half space is turned. A second staircase is a good feature, if it can be arranged.

COND, ON THE MOSEL, GERMANY. FROM A WATER-COLOUR DRAWING BY E. GUY DAWBER.

For the family we are planning for, eight bedrooms, a dressing-room and a workroom at least are needed.

As a comparison, taking the area of the rooms on the ground floor as 100, the following is the proportion of a plan of the rental value of 200*l.* :—

Billiard-room	24	Bedroom	12
Drawing "	19	"	7
Dining "	15	"	16
Hall	11	"	15
Kitchen	9	"	9
Scullery	5	"	9
Staircase	4	"	5
Housemaid's pantry, cupboards, water-closet, and lobby	13	"	9
	100		82

Now let us see what reductions are required for one of 80*l.* We will take the ground as a third of an acre. This would represent a plot 60 ft. by 240 ft., and the ground rent would be 13*l.* 10*s.* This leaves, on a 5 per cent. basis, 1,300*l.* for the house. I make the dining-room 16 ft. by 16 ft., with a large bay, the drawing-room 16 ft. by 15 ft., with folding doors into the hall, which is arranged so as to be used as a morning-room, or in conjunction with the drawing-room. The vestibule is approached through the housemaid's pantry, thus allowing the servant to answer the door without passing through the hall. The housemaid's pantry is arranged with a large gas-stove, so as to make it a summer kitchen. The kitchen is a fair size, with a scullery as a place for dish-washing only. On the first floor are four bedrooms, corresponding in area to the four rooms on the ground floor, the bath-room and water-closet being over the vestibule. In the attic are two bedrooms, dressing-room, linen-closet, and cistern-room. I think it is very important, from a sanitary point of view, to put the cistern in such a position that it can be readily and easily examined. Making the same comparison as before, the areas are:—

Dining-room	30
Drawing-room	28
Hall	10
Staircase	6
Kitchen	13
Scullery	4
Housemaid's pantry	6
Lavatory	3
	100

This house, with reduced area, still gives good accommodation for reasonable social usages, and in both the endeavour has been to work out the plans with the minimum amount of passage-ways.

In giving the percentage areas I have been endeavouring to arrive at the just proportion between the various rooms in houses such as we have under consideration. It appears to me that it would be a useful table if we could arrange some such scale. The problem appears to me to be as follows: Given the rental value of the house and no conditions as to the size of particular rooms being imposed, what has been found to be the relative area of each room as the result of experience? Of course, having fixed the areas for the ground floor, the other floors must follow more or less these dimensions. The comparison also depends on the houses compared being equally well built.

I have now described two plans at either end of my scale. The intermediate plans show a gradual increase in the scale of the accommodation, and you will find that as you rise from the lower to the higher rent the tenants become much more exigent. The question, I think, that would be most profitable to discuss is whether modern planning is abreast with the spirit of the age. Most buildings designed for particular purposes nowadays are highly specialised. Do our domestic buildings compare successfully with these specialised buildings in suiting the requirements of the persons occupying them, or are they governed by considerations other than the needs of the tenants, such as the reproduction of old buildings whose appropriateness to modern usage is rather open to question?

Mr. Appelbee's Paper.

Mr. Appelbee next read his paper as follows:—It is impossible in the time at my disposal to-night to do more than glance at a few of the points which influence the design of small suburban houses. My illustrations are limited to houses of not more than ten rooms and of these I have excluded the very smallest where it is probable no servant would be kept. Also excluded are houses having rooms for special purposes, such as doctors' and artists'.

COCHEM, ON THE MOSEL, GERMANY. FROM A WATER-COLOUR DRAWING BY E. GUY DAWBER.

BRUGES. FROM A WATER-COLOUR DRAWING BY E. GUY DAWBER.

The first point to influence the design is the site. It is obvious that all, especially in London, cannot have the advantages of building on gravel or high land, but the selection of a particular road is open to most. Personally, I would not care to own a house in a road running east and west, or, even worse, north-west to south-east, unless the site is large enough to permit side lighting as well as from front and rear.

Rooms should be so arranged that the sun may enter at least once every twenty-four hours. This is not always possible; but to arrange living-rooms where it is impossible, even during long summer days, seems to me little short of criminal. Great care is, however, necessary, as different rooms require the sun at different times of the day, the general rule being that it follows with our day's work: our bedrooms should face the east or south-east, the breakfast-room south-east, the drawing-room south to south-west, the kitchen south-east, while a study or library north, with a sunny window as well, or east. In a terrace house the fronts should be south-east and north-west; in others where side light is also obtainable more latitude is permissible.

As to prospect, it is nearly always the same thing for the dweller near a large town—buildings everywhere. There should, however, be trees in front and in the garden, and creepers on the house itself.

The next point that will come under consideration is the cost, which will fix the size and number of the rooms and the amount that can be expended on their fittings and decoration.

The common system of making approximate estimates by cubing or areas is apt to be very misleading. For example, the areas of all from the sitting-rooms to the pantries may be increased by 50 per cent., while the cost is only increased about 20 per cent., assuming that the heights are kept the same and the fittings of the same quality. To illustrate this take a terrace house 16 ft. between the party walls and 25 ft. from front to back:

area = 25ft. by 16ft. = 400 square feet.

Enlarge to 20 ft. from party wall to party wall and 30 ft. from back to front:

area = 30ft. by 20ft. = 600 square feet.

Assume the heights to be the same and compare the cost. Party walls first 50 ft. and secondly 60 ft. long = 20 per cent. increase, front and back walls first 32 ft. and secondly 40 ft. = say 20 per cent. increase (is really rather less). Skirtings and cornices will follow the walls. The finish to floors and ceilings and the roofing will obviously show a 50 per cent. increase. The joists of the upper floors will, however, show more, more depth being required owing to increase of span, and will be found to require in the particular instance quoted an additional 20 per cent. Many items require no increase whatever, *i.e.*, range, copper, stoves, and mantels. With the drainage and plumbing work, which is very expensive, the main items of manholes, vertical soil pipes and service pipes, bath and water-closet apparatus and sinks are not increased, and it is only the horizontal pipes between them, and these to the very small amount of 20 per cent.

For the purpose of this paper I have analysed the bill of quantities of a 1,450*l.* house, and I find on the above principles

	£		£
About	240	with no increase =	240
"	930	" 20 per cent. " =	1,107
"	280	" 50 per cent. " =	420
		And for extra depth of of floor joists, say ..	13
	£1,450		£1,780

or between 22 per cent. and 23 per cent. increase of cost for 50 per cent. additional accommodation.

While on the subject of cost, a word of warning should be said on what is perhaps the greatest architectural sin of the Victorian age, viz., the façade built in a more expensive manner than the return faces. This arrangement usually gives a thin cardboard-like effect and entirely destroys architectural solidity.

The first sketches should always show the principal furniture, and the relationship of doors, windows, and fireplaces should be considered with regard to each other and to the furniture.

COTTAGES, MATLOCK DALE. E. GUY DAWBER, ARCHITECT.

MATLOCK CHAPEL, DERBYSHIRE. E. GUY DAWBER, ARCHITECT.

Inside v. Outside Chimneys.

If the fires are well grouped, two, or at the most three, chimney-stacks will be required. If they are on inside walls the house is more economically warmed, and there is less chance of a down draught from a cold flue. On the other hand, a compact plan usually brings the internal doors together around a small hall or landing, and in order to prevent the doors spoiling the sitting space around the fires, or the plan from becoming straggling, the chimney breasts have usually to be planned in the outside walls.

The Casement v. the Double-hung Sash.

The double-hung sash is unquestionably convenient for lighting, ventilation, cleaning, and it is easy to keep clear of blinds and curtains: it is easily made weathertight, and is simple to fasten, but it probably requires more skill to make its appearance equal to that of a casement. The mullioned window, especially when long and low and without a transome, is undoubtedly picturesque. The casements are difficult to keep weathertight unless they open outwards, in which case one at least of an odd number of lights can never be cleaned from the inside of the room, and they interfere with flowers on the window-sill. An even number of lights for cleaning purposes must have all to open in pairs. Opening inwards overcomes the difficulty of cleaning, which is perhaps the greatest, but makes other difficulties with blinds, curtains, or a window-seat, and the absence of the weathertight qualities.

The Dining-room

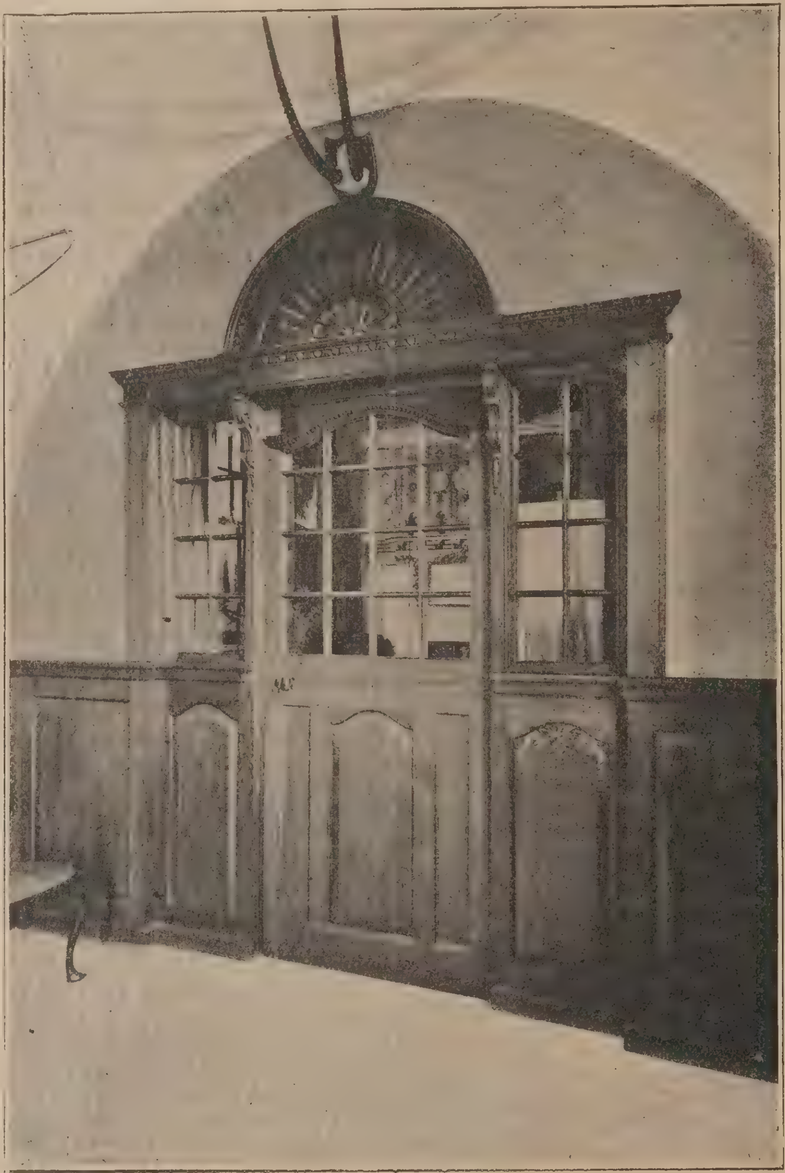
in a house of this class is the most important room, and in planning this the furniture should be sketched in, and its dual use as room for meals and the family sitting-room taken into consideration. A dining-table varies from 3 ft. 6 in. to 4 ft. 6 in. wide, and there should be room for one 6 ft. to 7 ft. long, and more at times, and a sideboard, one or two armchairs, often a couch or settee; and if there is no study the books of the house and a writing-table will be here also. The room, therefore, should not be too small (as it often is), and in this room in particular it is well to remember that doubling the area will not double the cost of a room. The best aspect for this room is south-east. Where this room is a general living-room as well as dining-room, a large bay or transept, making the room L-shaped, gives an interesting as well as convenient room. The bay is purely living-room, the other end of the L having the dining-table; the remaining portion has the fireplace, and may be considered as belonging to each branch of the L in turn.

The Drawing-room

in small houses is generally somewhat smaller than the dining-room, and is pleasant if it has the afternoon sun. A third sitting-room is a useful addition, and if on special occasions it can be thrown into connection with one of the others, so much the better. Its chief use will vary very much in different houses, as breakfast-room, morning-room, library, and den.

Bedrooms, &c.

Roughly one-third of our time is spent in bed, and, therefore, the bedrooms of the house should have particular care in their planning. An adult should have 2,500 cubic ft. of air per hour, equal to a room nearly 20 ft. by 13 ft. by 9 ft.; therefore the necessity for ensuring the repeated change of air in a room is obvious. Not only an exit flue but an inlet is required. A deep bottom bead on a sash window enables air to enter at the meeting rail. I do not think the casement can be made to give this advantage. Sun also is very essential to keep the room sweet and healthy, and should enter early in the day. A bedroom hot in the evening from a setting sun is disliked by most people. If the room is near an internal angle of the building, see that the window is not commanded by one in the return wall; in planning the room, show the principal furniture, the bed, with the light, if possible, from the side and space for a wardrobe. The dressing-table should have the back of the mirror to the window or between the windows if there are two; consideration should also be given to the morning opening of the window without having to move furniture first. In artificially lighting this room one light should be so arranged with regard to the dressing-table that the light falls on the dresser's face and not on the mirror. In a small room, if the bed occupies the position already suggested, this one light will probably serve the whole room. If electric, it is convenient to be able to switch it on and off from either the door or while lying in bed.



THE VESTIBULE, "HARTHURY," GLOUCESTERSHIRE. E. GUY DAWBER, ARCHITECT.

Bath, Lavatory and Water-closet.

In connection with the bedrooms the bath-room will be much used, and in these small houses it assumes a much greater relative importance than in large houses. In addition to the bath there should be a fitted lavatory, both to have hot and cold water (this arrangement means a great saving of labour in the house by lessening the amount of hot and cold water carried to each bedroom, and subsequent removal of slops). Some polished copper hot-water rails for airing towels are useful, and help to warm the room. The bath most commonly used has a roll top edge and no casing: this seems to me a mistake. As a rule, casings should be omitted whenever possible, that every part may be kept clean; but a bath is so big in bulk, and has usually to be placed against the wall so that no one can possibly reach over to clean the vertical space between the side of the bath and the wall. The shallow space between the bottom of the bath and the floor is almost as bad. Splashing over of water, often soapy, is inevitable, and the dust clings.

As near as possible to the bathroom should be the upstairs water-closet, but never in it. These two apartments seem to be the most difficult of all to arrange: they should be near the bedrooms, since the bathroom partially acts as a dressing-room, yet so retired that persons using the water-closet should not advertise their movements all over the rest of the house, and to this end do not permit any borrowed light from either to a neighbouring passage, and be very careful in the selection of the water-closet apparatus and the water-waste preventer that they may be as silent as possible. Next it is important to remember that a water-closet is not merely an apartment 6 ft. by 4 ft., or thereabouts, which may be partitioned off anywhere. It must not be overlooked that it is often 30 ft. high; in other words, the soil-pipe is an essential part of it, and if you place a water-closet on the principal elevation near the entrance door, this soil-pipe and the ventilation pipe which extends it will spoil the effect of everything. Bath and lavatory wastes are nearly as bad. Over the scullery, or some of the adjacent pantry or kitchen parts, is the natural place; but see that the water-closet is not over the larder—a point to which it always seems to gravitate. All places having water supplied to them should be as near to one another as possible, for economy of pipe work and also because of accidental overflows. A long distance, too, from the kitchen boiler to the bath or lavatory generally means that the circulating pipes have to cross hall or sitting-room, and as few people care to see them exposed here, they get boxed up in the floors and other improper and inaccessible places.

The Kitchen, Offices and Servants' Quarters

in small London houses are usually very cramped and deficient. The points about increase of size should be borne in mind here in particular. The kitchen is also the servants' living-room, and therefore should have as good an outlook as possible. Adjoining should be the scullery, primarily intended for the keeping and cleansing of the cooking utensils and the rougher part of the preparation of the food; but many other duties are now thrust on to it. The larder must be placed so that it is kept cool and away from the steam of the scullery copper. A lock-up store should be provided, where the lady of the house will keep extra groceries in reserve, and where dinner and other services and glass are kept. An exceedingly useful addition, even in the smallest house, is a china or housemaid's pantry provided with a lead-lined sink. Here tea and breakfast services are washed and stored, also plate and glass. Table-linen is also kept here. By attending to the lighter work here the mistress and young ladies of the house can assist without interfering with the servants. If planned as an ante-room between the kitchen and main house, it will also act as a ventilated disconnecting lobby, and help to prevent an unavoidable cookery smell extending all over the house.

The Stairs

may be made the most picturesque part of the house, but they must be practical also; they will have to be used by the very young and the infirm. Winders are often dangerous, and should never be curved on plan (as they often are at the foot of the stairs) if it is intended to carpet them. Bulky furniture will also have to go up and down, and at times a coffin.

The Plan

The width of the site is the next point that will determine the plan. Narrow sites must make the house one of a row; at 25 ft. it is possible to make it "semi-detached"; 40 ft. to 50 ft. is the least on which the smallest detached house will look well. The varieties of plan possible are, I think, more than is commonly supposed. In a terrace-house the simplest is to put two rooms on a floor facing the front and back of the site respectively, a part of one being cut off for the staircase, or the staircase may be put in between them. In these cases the kitchen and offices occupy a basement storey, two sitting-rooms on the ground floor, with probably two floors of sleeping-rooms over. Constructively cheap, owing to small amount of foundation and roofing (which the increased thickness of walls will not outweigh), they are very inconvenient, owing to the amount of stairs. There is, of course, three times as much staircase in a four-storey house as in one of two storeys. The first variation is to bring the kitchen to the ground floor in a wing behind the stairs, with the result that the look-out from one sitting-room is quite spoiled, the scullery or coals

THE OUTER COURTYARD, ITTON COURT, CHEPSTOW. E. GUY DAWBER, ARCHITECT.

enjoying the view. Another arrangement transposes sitting-room and kitchen department, opening the kitchen from the centre of the house. In both these types the getting in and out of coals and dust is a great difficulty unless there is a back way. In the Midlands it is a common practice in small houses of this kind to make a passage at the side common to two houses for this purpose, and as a tradesmen's entrance.

Terrace Houses.

Larger terrace houses are obtained by placing the drawing-room or a study upstairs and an additional floor of bedrooms. If this is done, great care must be taken with the approach. Most of us can probably call to mind examples where the stair is too narrow, and the bath and water-closet department too conspicuous *en route*. All terrace houses are open to many objections: the difficulty of getting sunshine to all rooms has been mentioned, and the difficulty with coals and dust where there is no basement. To these must be added that the drains, with rare exceptions, must pass under the building, and the transmission of sound from one house to another is very considerable. In the London district there is also the æsthetic objection that the party-walls must show above the roofs, and they are very difficult to treat in a satisfactory way. In many of the London districts external walls within 10 ft. of another house have also to have parapets above the roof. These points much affect the design. For example, a series of gables with their ridges over the centre of each house, and parallel to the party-walls, would work out in a most distressing and expensive manner.

Semi-detached Houses.

On narrow plots the semi-detached house is very like the terrace house already described. The front doors can, however, be put at the side away from the party-wall, and thus secure greater privacy; but this generally requires a wider plot. These pairs of symmetrically planned houses seem to me to be among the most unsatisfactory designs ever produced. A symmetrical elevation to the road has a great pier instead of opening as the central feature, and this is usually capped by the end of the parapet of the party-wall, which goes up by all sorts of irregular turns so much higher than all the roofs, turrets, dormers, &c., within 4 ft. or so of it. Sooner or later the houses drift into different ownership, and one paints his woodwork white and the other black, and the disaster is complete. The remedy is simple: do not plan a symmetrical pair.

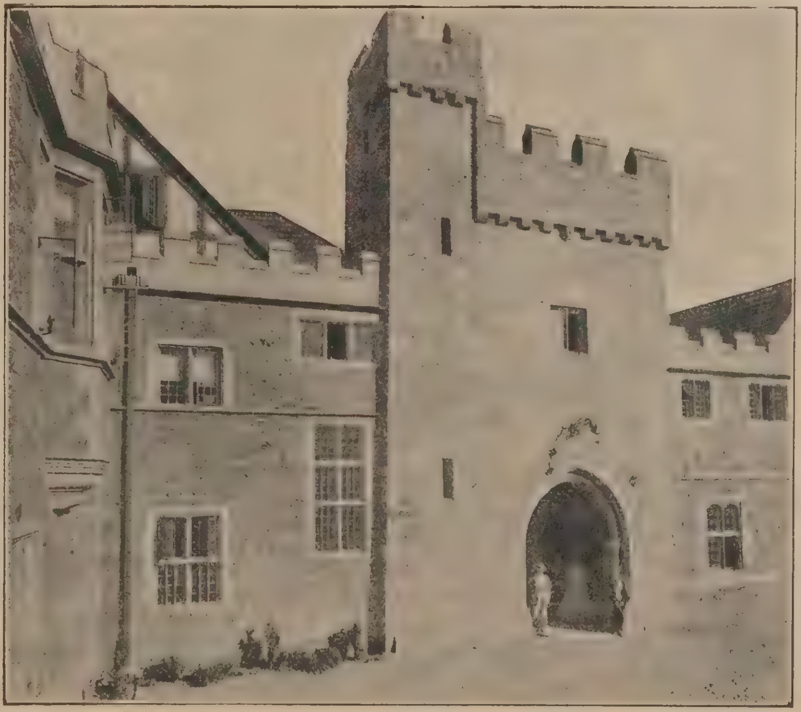
Larger detached and semi-detached houses are so varied in plan they are difficult to classify.

A most ingenious arrangement, which I do not remember to have seen elsewhere, was adopted in one house of making scullery, larder, coals, &c., less in height than the principal rooms, with a sort of mezzanine over them approached from the half-landing upstaircase. The mezzanine contained bathroom, water-closet and a good-sized linen-room: these in turn were kept very low, and the servants' bedroom was placed over. This part of the house was therefore three floors high against two elsewhere, but the top floor of the wing was only some six steps above the general first floor. This placing of the servant's bedroom would, I think, be generally appreciated both by servant and mistress.

A discussion followed in which Messrs. S. F. Clarkson, H. Lovegrove, and Henry T. Hare took part, and Messrs. H. D. Searles Wood and H. R. Appelbee briefly replied to the vote of thanks which was accorded to them on the motion of Mr. Clarkson, seconded by Mr. Lovegrove.

HENLEY'S NEW TOWN HALL.

THE new Town Hall and Municipal Buildings erected in the Market Place, Henley, as a permanent memorial of the reign of Queen Victoria, were opened recently. The new Hall, which is in the Renaissance style of architecture, has been erected according to the designs of Mr. Henry. T. Hare, F.R.I.B.A. The main entrance is approached by a low flight of stone steps, which lead to a porch. There are light iron gates instead of doors. Opposite the entrance is a flight of steps leading to the basement. The principal room is a drill hall, 40ft. by 25ft., warmed by hot-air pipes and available for other gatherings. There are two large offices with windows above the pavement, the ground level being half way up the rooms. One is intended for the surveyor's office. There is also a strong room, and rooms for the town sergeant. There is also an armoury and a store room. At the west end provision is made for lavatories, heating chambers and a coal cellar. From the porch are two staircases—to the right and left—leading to the rooms on the ground floor. There is a large entrance hall, 24ft. by 12ft., with a cloak-room and lavatory on each side. The other rooms on the ground floor are two committee rooms and a council chamber, above the drill hall. At the west end is a large kitchen, with a serving room. From this room is a lift to the large hall above. There is another staircase at the west end leading to the council chamber and Town Hall. A flight of Hopton-Wood stone steps leads to the main landing. The large hall is entered by three doors at the east end and one at the west end. The hall is 60 ft. by 40ft., with stage at the west end. There will be seating accommodation for 450 persons. At the back is a retiring room and a service room. The large hall is well lighted and should prove useful for concerts, &c. The council chamber is oak panelled. The middle light of the window over the front entrance is of stained glass. Running from the entrance hall on the ground floor is an ante-room, and on each side of this is a committee room. At the west end are rooms for the hall-keeper. The heating and ventilating was carried out by the Grahtryx Ventilating and Engineering Company. The roof is covered with Colley Weston stone slates. The work has been carried out by Mr. McCarthy E. Fitt, of Reading, with Mr. G. W. Simpson as clerk of the works. The original tender was £10,132, but this amount has been considerably exceeded.



THE ENTRANCE, ITTON COURT, CHEPSTOW.

GREYFRIARS CHURCH, ABERDEEN.

A REBUKE TO THE PHILISTINES.

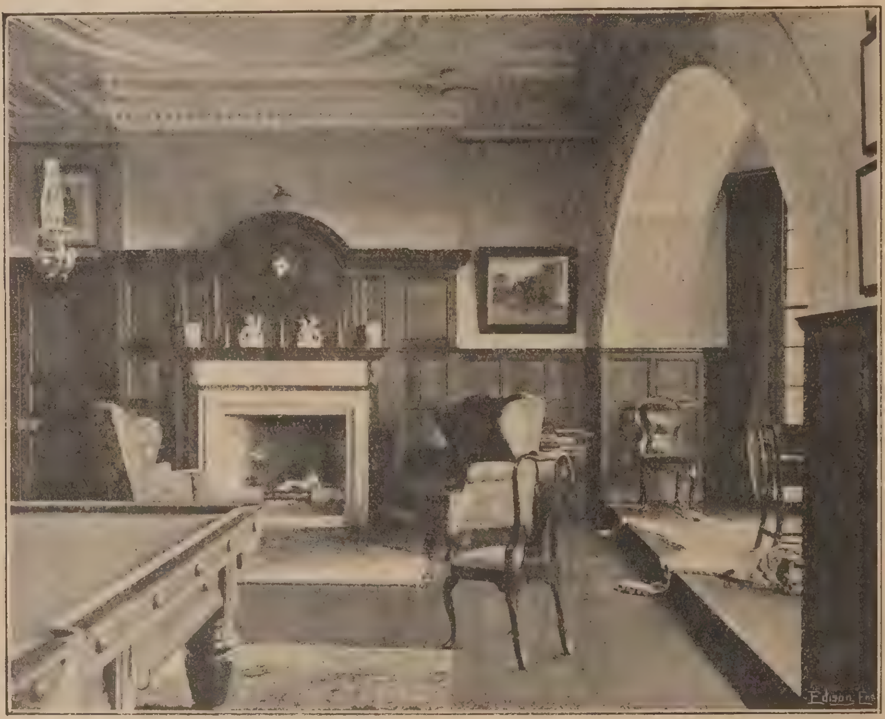
THE efforts to preserve the old Greyfriars Church at Aberdeen have proved fruitless, for after years of discussion the local authorities have decided to pull it down. This was the plaint of Professor Cooper's recent paper before the Glasgow Archæological Society. Again the Philistines, he remarked, had triumphed, and were rejoicing over the impending demolition of another of the scanty stock of pre-Reformation churches which Scotland could boast of. At the Whitsunday term the ancient church of Greyfriars, the principal fragment of mediæval architecture in the new town of that city, would be in the hands of the destroyers, and in the course of a few weeks would be swept utterly away.

There had been a talk of preserving the one notable feature of the building, the great window which was to have been incorporated in the new church; but he heard that it was doubtful if even this would be done. The result had not been reached without a struggle. The University, the Presbytery, the Ecclesiological Society of Aberdeen, eminent benefactors of the city, artists like Sir George Reid, and architects like Mr. Whyte, the architect of the University tower, one of the finest structures in the city, had pleaded in vain.

Their arguments had been reinforced with offers of large sums of money. There was one offer of £10,000. But all was to no purpose. The forces of Gath had won the victory, and all that could now be done was for societies like their own to preserve some written and pictorial records of an edifice which, alike on architectural and historical grounds, deserved a better fate.

Greyfriars Church was one of the convents of the Observantine branch of the Franciscan Order, which was introduced into Scotland by James I. early in the fifteenth century. The Aberdeen house was the third of their houses in Scotland, the two earlier being Edinburgh and St. Andrews. The present church was the second church designed by a very eminent Aberdeen architect, Alexander Galloway, of Kinkell, and was built at the expense of Bishop Gavin Dunbar, who sat as Bishop of Aberdeen from 1518 to 1537. It was a singularly fine specimen of late Gothic, and was important in the study of Scottish architecture as the signed work of a Scotch architect of that date. It was a proof that Gothic architecture of that period in Scotland had still great capacities.

The Professor went on to speak of the history of the church after the Reformation, and exhibited a fine series of measured drawings by Mr. A. R. Mackenzie, architect, of Aberdeen, as well as a water-colour drawing by Mr. Murray, Aberdeen. These drawings we hope to be able to reproduce soon.



BILLIARD-ROOM, "HARTPURY," GLOUCESTERSHIRE. E. GUY DAWBER, ARCHITECT.
MODELLED PLASTERWORK BY GEORGE P. BANKART.

PRESENT CONDITION OF THE BUILDING INDUSTRY.

ON page 79 of our issue for March 6th last we published a report of Mr. Thomas Blashill's paper before the Surveyors' Institution on "The Present Condition of the Building Industry." The discussion on it was renewed at the meeting of the Institution held on March 25th. Mr. Philip E. Pilditch pointed out that considerable attention had been directed to the question of the effectiveness of present-day labour. In the course of discussion complaint had been made of the indifference and lack of keenness of the modern workman. Experience had shown him that, even among the best class of workmen, about 10 per cent. did not come to work on Monday. A second and more serious ground of complaint was the tendency of the workman to act on the belief that to benefit himself by raising the rate of wages he should reduce the output as much as possible. In many sections of the trade the overtime scale of wages—rate and a quarter—was almost prohibitive. The unions had not been nearly so careful as they should be in regard to the class of men they admitted, and thus many men obtained the full rate when their skill was worth, perhaps, 25 per cent. less. During the last 25 or 30 years wages in the building trades had risen considerably, but the average workman did not do as good work as formerly.

Mr. A. Vernon emphasised the need of obviating in some way or other the levelling-down principle fostered by trade unionism in its present form, and referred to the public disadvantages arising from the increased cost of house-building. Twenty per cent. of the rise in cost was divided equally between capital and labour, and 15 or 20 per cent more was due to the effect of unnecessary by-laws.

Mr. Blashill, replying on the discussion, maintained that the builders ought to be encouraged to do the steel work, if they would undertake it. With regard to the labour question, no one could prove that trade unions by any written law advocated the diminution of work, but there could be no doubt that individuals had done so. A builder of position had written to say that during the last ten years the cost of labour had increased 75 to 100 per cent. If that were so, and the rate of wages had only risen 10 per cent., it followed that there was a large margin to be accounted for. He saw no reason why the apprenticeship system should not again be revived.

New Patents.

These patents are open to opposition until May 6th.

1900.—Sewage Disposal.—4,173. D. CAMERON, 1 Sylvan Road, Pennsylvania; F. J. COMMIN, 7 Bedford Circus; and A. J. MARTIN, Bradninch House; all of Exeter. The object of this invention is to do away with the need for pumping sewage in flat districts, or, when this is impossible, to lessen the work of lifting the sewage. Septic tanks are placed as high up in the outfall sewer as possible, and as the sewage passes through them the solid matter is acted upon and destroyed by the micro-organisms, so that the effluent may be conveyed to the outfall at the flattest gradient at which a sewer of the desired size will carry it.

Water-closet Standards.—5,852. H. H. GREEN, Nelson Street, Wolverhampton. The standards are provided with screwed feet which can be raised or lowered to suit different basins or to compensate for unevenness of the floor.

Chimney Cowls.—6,343. W., J. T. and J. T. POLLARD, all of 36 West Gate, Burnley. The cowl is mounted on ball bearings, the balls being of metal, glass, porcelain, or other suitable material.

Travelling Cranes.—7,883. F. W. TANNETT-WALKER, Hunslet, Leeds. The power for lifting is communicated to the crab on the traveller by a rope running from end to end of the shop. The carriage on the traveller may be moved across the shop at any part. The hoisting rope has one end fixed to the carriage and the other end to the traveller, and passes around pulleys on the latter and on the crab, so that the movement of the carriage raises or lowers the weight.

Theodolite Stands.—17,632. A. KAUFMANN, Kaiser Friedrich Ring 20, Wiesbaden, Prussia. This stand can be closed up sufficiently small to go in the coat-pocket. It consists of an ordinary flat top-piece to which three coiled strips of aluminium are fitted. When required they are drawn out in the form of legs.

The following specifications were published on Saturday last, and are open to opposition until May 13th. A summary of the more important of them will be given next week. The names in italics within parentheses are those of communicators of inventions.

1900.—4,552, DRESSER, pipe couplings. 4,590, WINTRINGHAM AND WILLS, friction rollers for woodworking machinery. 4,689, HIGGINS, treatment of wood for preservative, desiccating and seasoning purposes. 6,241, LEONARD, apparatus for painting or cleaning columns, pipes, &c. 6,255, CHARLESWORTH, device for fastening windows. 6,595, SPURWAY, straw roofing. 6,865, SUNDERLAND, SUNDERLAND AND MARSHALL, apparatus for the generation of acetylene gas. 7,945, GRAY, construction of fireproof flooring or roofing. 8,029, HILL, Venetian blind furniture. 8,235, GLOVER, street and similar gas lamps. 8,394, RHODES AND GAUNT, syphonic flushing apparatus. 8,652, SEWARD AND WALTON, method of ventilating buildings. 11,267, IMRAY (*Opalite Tile Company*), manufacture of glass tiles. 13,658, GRAHAM, apparatus for automatically emptying bacteria beds or filters, tanks, &c. 14,152, DYMOND (*Smith*), dry closets and refuse incinerators. 14,620, LETTICE, disinfecting apparatus for water-closets. 19,136, WELDON, brick-making machines. 21,466, POWELL, gate valves.

1901.—437, BROOKES (*Fiske*), kilns for burning bricks. 1,873, PARSONS, means for moving and regulating sliding window sashes. 2,365, ADAMS AND ROWLEY, manufacture of flushing rims of earthenware water-closets, &c. 2,510, KATZENBERGER, flushing devices. 2,611, TWAMLEY, brick-kiln furnaces. 2,842, FLATHER, manufacture of varnish. 2,860, BARRETO, oven for use in the manufacture of bricks.

Builders' Notes.

Mr. Robert Weeks, master painter and decorator, of 3 Hobart Street, Stonehouse, died recently at the age of 74.

Mr. John Caton, junior, a well-known builder, of 78 Feilden Street, Blackburn, died recently at the age of 38 years. The deceased was the eldest son of Mr. John Caton, builder, of Feilden Street.

Partnership Dissolved.—The partnership heretofore subsisting between Messrs. Robert Ridgway, Ernest James Ridgway, and Walter George Ridgway, carrying on business as builders, contractors and estate agents at 2 Blurton Road, Lower Clapton, London, under the style or firm of R. Ridgway and Sons, has been dissolved by mutual consent as and from March 25th, 1901. All debts due to and owing by the said late firm will be received and paid by Messrs. Ernest James Ridgway and Walter George Ridgway.

London County Council.—At last week's meeting of the Council a long discussion arose in regard to the Clare Market housing scheme. The Housing of the Working Classes Committee submitted for approval an estimate of £26,285 for expenses connected with the erection of three blocks of dwellings on the Duke's Court site, Drury Lane, for the accommodation of 610 persons. One member pointed out that the rent per room in these buildings was 3s. a week, while the Guinness Trust were letting rooms at 2s. 1½d. per week. Mr. Beachcroft said that the Council could not rehouse people who had been living under crowded conditions. The law would not allow it. Mr. Alderman Alliston asked how people could pay proper rents when they were so scandalously underpaid. This housing question was, he said, a question of wages. It arose on account of the miserable conditions of unskilled labour. The Committee's estimate was eventually approved. Upon the recommendation of the Building Act Committee it was decided not to allow an iron and glass shelter to be erected at the entrance to De Keyser's Royal Hotel on the Victoria Embankment. It was also resolved to instruct the Highways Committee to consider (a) the routes along which extensions of the London tramways system ought to take; (b) the establishment of a tramway centre or centres to which extensions shall converge; (c) the railway extensions required to perfect the London overhead railway system; (d) the extensions required to perfect the London tube or underground railway system.

Lead Glazes.—A Parliamentary paper was issued last week on the use of lead in the manufacture of pottery, containing communications from Dr. Thorpe, the principal of the Government Laboratory, to the Home Office subsequent to the Report on Lead Compounds in pottery made by him and Dr. Oliver. Upon the relation between the composition of lead fritts and the solubility of their contained lead in 0·25 per cent. hydrochloric acid, he says the solubility appears to depend on the value of the ratio existing between the bases and the acids contained in the fritt, and if the fritt is to be practically insoluble in the reagent named this number must not exceed 1·45 or thereabouts. Experiments undertaken to discover whether the solubility is affected by the degree of fineness to which the fritt is ground show that the fineness has no practical bearing on the question up to the limits of practical requirements. From inquiries made in various parts of the country by Dr. Thorpe to ascertain whether, in the case of manufactures of ordinary red, brown and other coarse ware, there would be any practical hardship in requesting the use of blue lead or galena instead of red or white lead, if they declined to employ fritted lead, the impression he gained was that there would be none. Galena is the cheapest lead compound available, though it has the disadvantage that it must be ground, and to get the necessary mill might be a serious matter to a small manufacturer in view of the small amounts he would need to use.

Law Cases.

Workmen's Compensation: Employer's Unsuccessful Appeal.—The case of *Whitehead* v. *Reader* was heard in the Court of Appeal last week. This was an appeal from the award of the judge of the Coventry County Court under the Workmen's Compensation Act, 1897. The County Court judge's notes stated that the applicant for compensation was a carpenter, who at the time of the accident was in the employment of Reader. The applicant was sharpening one of his tools on a grindstone. The grindstone was worked by a leather band, which passed over shafting connected with a gas engine, and the band slipped off the stone. The applicant, in trying to replace the band, was caught by it, and was injured. The applicant had orders not to touch the machinery, and, in trying to replace the band as he did, he was acting contrary to his orders. It was objected that the accident did not arise out of and in the course of his employment. The County Court judge overruled the objection. It was admitted that for the present the applicant was totally incapacitated, and the County Court judge awarded him 12s. 6d. per week, being one-half of his average weekly earnings. The employer appealed. The Court, however, dismissed the appeal.

VILLAGE SCHOOLS, STOW-ON-THE-WOLD, GLOUCESTERSHIRE.
E. GUY DAWBER, ARCHITECT.

A Bristol Building Contract.—The case of *Krauss* v. *the Mayor and Corporation of Bristol* came before the Court of Appeal on March 25th. Mr. Justice Grantham had refused to refer the cause of a dispute between the plaintiff and the defendants to the arbitrator appointed under the contract in case disputes should arise between the parties. But this case, according to the plantiff's counsel, did not come under the head of a dispute such as usually arises under a building contract. The plaintiff brought his action to recover damages from the Corporation for delay and inconvenience caused by the Corporation, or those acting on their behalf, in connection with the erection of the isolation hospital of Bristol Lunatic Asylum. The plaintiff's claim for damage was, in brief, based upon the allegation that his men were prevented from laying the floor of the isolation hospital of the asylum because of the delay of the contractors, Messrs. Hayden and Sons, in providing the heating and ventilating apparatus, and the contractors who had to provide the grates and chimney-pieces had failed to do so in time. The Corporation applied to have the matters in dispute referred to the architect, who was to be the sole and final arbitrator, according to the contract, between the parties. Mr. Justice Grantham refused to stay the action, as he did not think that the case was one with which the arbitrator was intended to deal In the present case the architect had condemned the timber proposed to be used for the floors of the hospital on the ground that it was green and unseasoned. This was denied by Mr. Hudson and Mr. Inskip, who represented the respondent. Both contended that the delay complained of was outside the matters ordinarily in dispute in building contracts The Master of the Rolls, in giving judgment. said it was an ordinary building contract that was in question between the parties, and by a clause in that contract all matters in dispute incident to the work to be undertaken were to be settled by the arbitrator, who was the architect or clerk of works. The correspondence in the case showed that the matter in dispute was one for the arbitrator, and that such a dispute could be satisfactorily adjusted by him between the parties. The present case was on all fours with that of *Jackson* v. *the Bury Railway*; and the other cases which had been cited did not apply in this case. The dispute here really related to the material the builder was using, and that was a matter for arbitration in accordance with the agreement contained in the contract. With great submission, he could not accept the view of the case taken by Mr. Justice Grantham. The appeal of the Corporation must be allowed, with costs. All that the Court could do would be to stay the plaintiff's action; whether the parties went to arbitration was a matter for themselves. Lords Justices Collins and Romer concurred. The appeal was therefore allowed with costs.

An Interesting Case affecting House Drainage.—The case of *Hedley* v. *Webb* was heard in the Chancery Division of the High Court of Justice on Wednesday last. R. G. Marchant was the owner in fee of two plots of land on the Longlands Park Estate, Sidcup, and of one-half of Park Hill Road, running in front of the two plots. He conveyed the two plots and the half of the road to the plaintiff. The defendant was the owner of the adjoining plot and of half the road in front of it, and on this plot he had erected a pair of semi-detached houses. He laid down two sets of pipes from the water-closets of his two houses, which ultimately joined and ran into one common conduit which was connected with the sewer (vested in the local authority) in Park Hill Road. This connection with the sewer was made under the road in front of one of the plaintiff's plots. The plaintiff claimed a declaration that the defendant was not entitled to drain his premises through the plaintiff's premises, and an order for removal of the connection. The defendant contended that his two houses were two buildings within the meaning of the Public Health Act, 1875, and therefore that, from the point of junction of the pipes from the houses to the sewer, the conduit was itself a "sewer" within the meaning of the Act, and that, being a sewer, it was now vested in the local authority. The plaintiff, on the contrary, argued that the two houses were only one building, and that the conduit was only a drain; but that, whether it was a sewer or a drain, the defendant could not by what was a trespass and an unlawful act deprive the plaintiff of his rights in his own land. Mr. Justice Cozens-Hardy, in delivering judgment, said that a structure might be one building whether it was occupied by one or more person or persons, and whether in flats or not. The term "one building" was not equivalent to the term "one house." A pair of semi-detached houses might be one building only. In *Kershaw* v. *Taylor* (1895, 2 Q.B., 208, 471) a Divisional Court held that from the point of junction the culvert was a sewer and not a drain within the Metropolis Local Management Act, 1855, but there the drainage came from two separate pairs of semi-detached houses. In *Travis* v. *Uttley* (1894, 1 Q.B., 233) it was held that a pipe receiving the drainage of more than one "building" was a sewer within the meaning of the Public Health Act; but in the present case the erection was only one building, although it consisted of two semi-detached houses, and this culvert, so far as it ran through the plaintiff's land, was not a sewer. But even if it was a sewer there would be a further difficulty. Could a man by making a culvert wrongfully on another man's land without his consent make it a sewer so as to vest it in the local authority and divert the property from the owner of the land? The observations of Mr. Justice Chitty and the Court of Appeal in *Meader* v. *West Cowes Local Board* (1892, 3 Ch, 18) were against the defendant on this point. Webb could not by a trespass on the plaintiff's own land make something a sewer so as to prejudice the plaintiff. His Lordship then disposed of other defences raised by the defendant, made a declaration that the defendant was not entitled to drain through plaintiff's premises, and ordered the defendant to take up and remove the drain complained of.

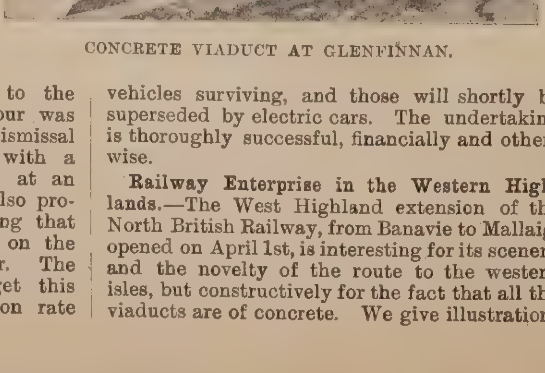
Union Labourers' Action against Builders.—The cases of *Powell* v. *Hanscomb and Smith* and *Purkiss* v. *Hanscomb and Smith* was heard at the Croydon County Court on March 26th. The plaintiffs, who are bricklayers' labourers belonging to the United Labourers' Union, sued the defendant builders (carrying on business at Croydon) for the difference in wages paid at 6½d. per hour and 7d. per hour. Mr. Gardner (instructed by their Union) appeared for the plaintiffs, and the defendants were represented by Dr. Newnham, LL.D., under instructions from the Croydon and District Master Builders' Federation. It appeared that Powell had been engaged on the defendants' works for two weeks and one day, and Purkiss for a few days only, both the men being started by the foreman of works without any specific agreement as to the wages paid. The foreman gave evidence to the effect that the only time 7d. per hour was mentioned by the plaintiffs before dismissal was when Powell approached him with a view to taking over the scaffolding at an increased rate of ½d. per hour; he also produced defendants' wages-book, showing that the whole of the remaining labourers on the works were receiving 6½d. per hour. The plaintiffs' solicitor endeavoured to get this witness to admit that the London Union rate of 7d. per hour was generally paid in Croydon on account of the town coming within the twelve miles' radius, as fixed by the London Master Builder's Association and the workmen's unions; but the witness stated that after many years' experience in the capacity of builder's foreman for the largest firms in the town, he had never known a labourer's wage to be more than 6½d. per hour. Messrs. S. Page and D. Waller, builders, of Croydon, and Mr. E. J. Fairchild, secretary to the Federation, gave evidence as to the trade custom of engagement and payment, and also to prove that the beforementioned arrangement as to the radius had never been acknowledged by the Croydon builders, who have an entirely independent organisation, comprising all the most important firms in the district, and whose maximum rate of wage for all trades has always been ½d. per hour less than the London Union rate. The names of John Tidy and Messrs. Wenham and Waters were put forward by the plaintiffs' solicitor as firms for whom Powell had previously worked at the higher rate, but the first was proved to be a piecework bricklayer or sub-contractor, and the others the well-known firm of electrical engineers. His Honour (Judge Russell) held that Powell, from the fact that he worked at the lower rate after receiving his wages the first week, had in effect agreed to it, and because both he and Purkiss had not enquired as to the rate paid in the works they were therefore employed by the foreman in accordance with the usual custom, and entitled to the same rate of payment as other labourers in the district, which he held the evidence had conclusively proved to be 6½d. per hour. He therefore gave judgment for the defendants in both cases. The defendants' solicitor stated his clients did not ask for costs.

Engineering Notes.

The Fylde Joint Hospital, near Lytham, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves and grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

London Water Supply.—In their report on the composition of the water supplied to London during February, Sir William Crookes and Professor Dewar state that all the 184 samples examined were found to be clear, bright and well filtered.

Liverpool Electric Tramways.—The Liverpool Corporation have now 269 electric cars on the city streets (worked on the trolley system with overhead wires), only seventeen horse vehicles surviving, and those will shortly be superseded by electric cars. The undertaking is thoroughly successful, financially and otherwise.



CONCRETE VIADUCT AT GLENFINNAN.

Railway Enterprise in the Western Highlands.—The West Highland extension of the North British Railway, from Banavie to Mallaig, opened on April 1st, is interesting for its scenery and the novelty of the route to the western isles, but constructively for the fact that all the viaducts are of concrete. We give illustrations of the concrete viaduct at Glenfinnan, and o the destination of the line, Mallaig itself. It i expected that there will be a heavy touris traffic this season over the new line, the scener from which is wonderfully fine.

NORTH BRITISH RAILWAY EXTENSION: MALLAIG.

Widening of London Bridge.—The preambl of the Bill for widening London Bridge wa passed last week and ordered to be reported t the House for third reading.

New Graving Dock for Liverpool.—Subjec to confirmation this week, the Mersey Dock and Harbour Board have decided to construc a new graving dock on the site of the Soutl Carriers' Dock, at an estimated cost o £136,000.

Bournemouth's Pavilion Scheme.—After recently rejecting a scheme to erect a pavilion a the shore end of the pier at a cost of £40,000 the Bournemouth Town Council are favourabl considering a committee's recommendation t build a pavilion or shelter at a cost of £15,000 The surveyor has been instructed to prepar plans, &c., for a pavilion to cost £25,000. Bu matters are far from settled yet.

Bridging the Wansbeck.—We understan that Messrs. Deuchar and Son, of Newcastle have offered to contribute the sum of £1,00 towards the cost of building a bridge over th Wansbeck at Stakeford, one of the most dangerous of the fords on the Wansbeck, and the scen of numerous dangerous accidents. Messrs. Balfour and Son, engineers, of Newcastle, estimat the cost of a bridge from Snowdon's bank a the Stakeford side to the Station Bank at North Seaton at £10,000.

Dock Building in the Bristol Channel.—Very remarkable enterprise is being shown at the Bristol Channel ports in dock building. At Cardiff and Llanelly there are docks under construction costing £1,500,000 and £200,000 respectively, and from Bristol, Swansea and Newport bills have been promoted for extensions costing £1,800,000, £1,750,000 and £750,000. All this is in addition to six undertakings of the same kind finished within the last thirteen years, and it will bring up the recent expenditure at Bristol Channel ports to close upon £12,000,000.

North-Western Railway Extensions.—Great works are now in hand on various parts of the North-Western railway system. The new station at Lancaster is being pushed forward with energy by the contractors, and by the time that the passenger season is well advanced it will be ready to ease the congestion somewhat, although it is impossible for it to be by any means complete. The Crewe works are all but finished underground, and when the works in connection with the reconstruction of the station get well in hand there will be the manifest beginning of a tremendous change in that famous centre. At the London end the demolition of Park Village will effect no slight alteration, and the provision of extra lines (four it is stated) from Chalk Farm into Euston will greatly facilitate the traffic management. The erection of the new hotel and the extension of Euston Station into the Euston Road are matters which the directors are keeping back for the present, as well as the Shap widening and new works. But postponed does not mean forgotten or given up.

Bricks and Mortar.

Aphorism for the Week.

"*Never build after you are five-and-forty; have five years' income in hand beofre you lay a brick; and always calculate the expense at double the estimate.*"—Kett.

Our Plates. Particulars of St. John's Chapel, Matlock Dale, and of the drawing-room at Hartpury, Gloucestershire, will be found in the article on the work of Mr. E. Guy Dawber, which begins on page 148 of this issue.—The houses at Weetwood, near Leeds, known by the name of Weetwood Garth, have been erected on the site of an old house that has been pulled down, and of which a small portion of more modern construction has been incorporated with the new building. It will be noticed that the houses are built on two different levels, the further one, which retains a portion of the old building, being the lower of the two. The ground-floor storeys are built of local hammer-dressed stone, and the upper storeys are covered with rough-cast, the woodwork of cornices and window framing, gables, &c., being painted a willow shade of green. The roofs are boarded and felted, and are covered with Yorkshire stone slates, which are largely used on old houses in the neighbourhood. The houses were built for George William Brown, Esq., of Belsize Park Gardens, Hampstead, London, from the designs and under the superintendence of Mr. William H. Thorp, F.R.I.B.A., of 61 Albion Street, Leeds.

Model Villages. Mr. George Cadbury, of Northfield, Worcestershire, has given to Birmingham a residential estate at Bournville, four miles from the centre of Birmingham, consisting of 330 acres, of which about one-third has been laid out. Upon this 370 cottages have been built. Of these 143 have been sold at cost price on leases of 999 years, 3 per cent. being charged to those who paid less than half of the cost, and 2½ per cent. to those who paid at least half the cost. The remaining 227 cottages and shops are let to weekly tenants, and the rents of these, ground rents, &c., are paid into the trust. There are about 200 allotments, which are in much demand from the inhabitants of the adjacent manufacturing villages. The total rent roll, exclusive of repayment for cottages sold, is £5,246 a year, which, after current expenses are paid, is to be devoted to the development of the estate and the building of more cottages. The value of the estate is estimated at between £170,000 and £180,000. Mr. Cadbury's main object is to secure the erection of sanitary and healthful dwellings for the working classes and labouring population without any chance of overcrowding, and so arranged that the residents shall be sure of fresh air, country surroundings, and an abundance of open space. When this estate is completed it is intended, with the income from it, to purchase similar estates, but the intention of the founder is that such estates may be developed as manufacturing centres, one-fifteenth only to be used for manufactories, one-tenth at least to be used for open spaces, and the remainder, as on the Bournville estate, to be laid out for cottages and gardens, the buildings not to cover more than one-fourth of the land on which they are erected.

A Model Trade School. In New York there is a model trade school which was erected at a cost of £34,000 by the munificence of the Baroness de Hirsch. It is so designed that 120 pupils can be graduated yearly. The aim of the school is to fit young men, not under sixteen years of age, to enter one of the mechanical trades as a means of livelihood, and this object is attained in a course of five and a-half months. The time devoted to the course may at first sight seem rather short; but it has been fixed after careful consideration. The trade courses are in carpentry, plumbing, sign-painting, house-painting, machinery, and electrical work. Instruction in geometrical and mechanical drawing is given to all the pupils, practical problems being given them to solve, and a series of drawings being made from models showing the principles on which working drawings are constructed. As a result of the work there have been many cases of marked success. Out of 272 graduates of eight classes, 188, or 69 per cent., reported their occupations at certain periods ranging from six months to two and a-half years after graduation. Of this number 145, or 77 per cent., were working at the trade learned in the school, and the remainder, or 23 per cent., were engaged in other occupations. It is reasonable to suppose that the same proportion holds good for the eighty-four graduates from whom a report had not been received. Taking the average wages received by members of these classes at the commencement of their employment the amount was 19s. 6d. per week, and when they were last heard from was £1 9s. 9d. per week, a gain of 53 per cent. in an average length of time of seventeen months. It is found from reports received from employers who have been communicated with that they find it pays better to employ boys trained at the Hirsch Institute than to endeavour to train them themselves.

To Improve Paris. A notable scheme for improving the Champs de Mars has been laid before the Paris authorities by M. Bouvard, the municipal functionary whose special province is street improvements, and who is showing himself by his energy and initiative a worthy successor of that great reformer M. Alphand. As every tourist is aware, the Champ de Mars, the site of the Eiffel Tower, is a vast open space stretching from the Seine to the Ecole Militaire. Except when an exhibition is in progress, it is somewhat of a No Man's Land, almost a stretch of waste ground, kept up in perfunctory fashion and destitute in the main of attractiveness. M. Bouvard proposes to convert it into a park and model public promenade. A lake will occupy the centre, and plantations and lawns will make the spot the rival of the Champs Elysées. The scheme further provides for the demolition of the familiar Galerie des Machines, which, though a triumph of engineering skill, is a desperately ugly edifice. The removal of this monster, and in some respects monstrous iron construction, will open up the Ecole Militaire, which will become visible from the Trocadéro. The Ecole Militaire, designed by the famous architect Gabriel, certainly deserves a better fate than to be hidden away behind the gigantic girders of the Galerie des Machines. But the crowning advantage of M. Bouvard's project is that it would be most profitable to the city of Paris. A strip of land on either side of the Champs de Mars is to be sold for building purposes, it being stipulated that the houses to be erected shall be mansions standing in their own grounds. The money that would be obtained in this way is estimated at nearly a half a million sterling, and would leave a very handsome balance after the park had been created, the total outlay on which is not expected to exceed £40,000.

Churches for Men, not Men for Churches. Preaching in Carlisle Cathedral recently on clerical incomes, Archdeacon Diggle said: "No community of Christians makes such scant sacrifices for its ministers as the Church of England. The laity are indeed sometimes munificent in other directions. They build churches, supply organs, put in stained-glass windows, but they do not equitably remunerate the clergy. Yet the Church needs men more than buildings, spiritual and intellectual lights more than windows, however beautiful. Christ built no churches. He commissioned men. We begin at the wrong end. In new parishes we build the church and starve the man. We ought first to endow the man, then build and beautify the Church."

M. de Morgan's Discoveries. The publication by the French Government of the first memoir by M. de Morgan on his recent explorations at Susa has marked an epoch in Oriental archæology. For about five years the expedition of which he was the head has been engaged on the site of the ancient Persian capital, and the results have far exceeded the expectations which had been formed. The work of former explorers had been hitherto confined to the larger of the two tumuli at Shastu, the modern name of the locality. Here Mr. Kenneth Loftus in 1851 and M. Dienlafoy in 1887 found the remains of the *apadanas*, or coloured halls in the palaces of Darius Hystaspes and Artaxerxes; and M. Dienlafoy obtained the fine series of sculptures which now adorn the Susanian rooms in the Louvre. It was evident that the smaller or western mound marked the site of the older city destroyed by Asurbanipal 640 B.C. The attention of the recent expedition was accordingly directed to this spot.

Buried Cities. Traces of no less than five distinct settlements have been found on the site. Commencing from the upper part, we have first a Græco-Parthian layer of remains, dating about B.C. 300—200; below this the remains of the Persian Achæmenian settlement, B.C. 500—300: and beneath this again, the older city, almost wholly destroyed in 640 B.C. These explorations reveal the important fact that, though the city was pillaged, burned with fire, and the palaces wrecked by Asurbanipal in his terrible campaign of vengence, it was, nevertheless, not totally destroyed; and there was found among the *débris* a cylinder of Nebuchadnezzar the Great, which shows that the city was occupied during the time of the Jewish Captivity, and that it is quite possible Daniel may have visited it. The city which was destroyed by the Assyrians probably dates from about B.C. 1800, as bricks of the Kassite rulers of Babylonia were discovered there. M. de Morgan has not yet worked up all the material he has obtained, but he is to be congratulated on having achieved one of the most important works of Oriental exploration of recent years.

Sussex Fonts. Mr. Lewis Andre was recently speaking about the fonts of Sussex before the county archæological society. He remarked that a feature of the fonts is that, while a church may have been entirely rebuilt the font has been almost invariably retained. Mr. Andre commented on the absence of Norman fonts in Sussex, and said that examples of sculptural work are extremely rare on Sussex fonts; the only one bearing groups, or even single figures, is at Brighton. Foliage work is to be seen at Bury, Etchingham and Mountfield, and animals at Salehurst and Slaugham, while at Denton and Lewes there are fonts with basket-work ornamentation. One at Yapton has crosses. Emblems of the Passion are to be seen at St. Clement, Hastings, and heraldry at Burwash and Mountfield.

Rosendale Hall, Dulwich. Rosendale Hall, at the junction of the New Clive Road, Dulwich, is fast disappearing under the hand of the destroyer. Over the gateway was the date 1658, but there were evidences of older date inside. Lord Chancellor Thurlow, it seems, made it his residence for some time, and it was he—somewhere about 1780—who made many structural alterations in the house, and left it much as it was in our day. In 1658, two years before the restoration of King Charles II., Dulwich was far away in the country and stood in the great woodland which extended as far as Croydon. Not so many years ago extensive stables and dog kennels were standing near the house. One of the local archæologists, who was fortunate enough to obtain permission to go over the old place before it was handed over to destruction, says that the interior was full of roomy cupboards and closets built in the thicknesses of the lower walls, and that the kitchen was ample and quite "baronial," with a paved floor and a fireplace which until recently displayed an ancient turnspit. Rosendale had eighteen rooms, some of fine proportions, and one of the finest and quaintest was known as the "King's bedroom"—Charles II.'s room when he came a-hunting. From the quaint hall rose a fine oak staircase, and in some of the upstairs rooms was some good early furniture.

MOVABLE FLOORS FOR PUBLIC BATHS.

BY EDWIN B. B. NEWTON, F.S.I.,
ASSOC.M.INST.C.E.

IN view of comparatively recent legislative changes, the question of providing in public baths, floors which can be erected over the large swimming ponds, after the summer season has ended, is one which is likely to continue to engage the attention of municipal surveyors and architects.

Section 5 of the Baths and Wash-houses Act of 1878 gave power to commissioners of baths to close from November to March any covered or open swimming bath, and to use the covered space for the purposes of a gymnasium, for other means of healthful recreation, for holding vestry meetings, or for other parochial purposes, but it contained a proviso to the effect that the covered space should not be used for music or dancing.

As is well known, in the majority of cases public baths are not carried on at a profit, as the swimming baths (the preparation and upkeep of which are always costly) are, if open, little patronised during the winter, so that the revenue from them is correspondingly small. In the alternative the section above referred to did not allow the baths, when closed, to be made very remunerative. Accordingly, with the view of lightening the burden on the rates, an Act, applying to London only, was passed in 1896 permitting under certain conditions closed baths, when structurally fit, to be used for music and dancing, and in 1899 a similar power was given in respect of baths in the provinces.

Advantage has been taken of the powers given by these two Acts in many cases, and in almost all it has been, and will be, necessary, for the purpose of making use of the baths for entertainments, &c., to construct floors over the swimming ponds.

Being of a temporary nature only, though likely to be subjected to the burden of heavy loads, it is essential that the floor shall be as light as is consistent with adequate strength and be capable of being easily and quickly fixed, and taken up and packed away in as small a compass as possible. The various parts should therefore be of moderate dimensions and light weight. Fixed frames should be avoided, and the whole made to take apart in single pieces.

The verge of the pond is generally as shown in Fig. 1. The floor may be brought to the nosing with its surface level with that of the verge, or fixed with its surface higher, so as to rest upon the verge and be continued to the dressing-boxes or the main wall, accordingly as the dressing-boxes are fixed or removable.

If the surfaces of the floor and the verge are to be continuous, the gutter around the pond must be filled up in some manner, e.g., with cement, which has subsequently to be chipped out. But there are many disadvantages attached to this plan; the floor and verge are not of the same material, the slate or other verge is often cold, cheerless and sometimes slippery, while considerable difficulty is at first experienced, by reason of the shrinkage occurring, in refitting the floor boards inside the rounded ends of the pond.

It is better, therefore, to cover the whole, or the greatest possible, area of the bath-house with the floor.

A typical swimming-bath house is shown by full lines in Fig. 2, the dotted lines indicating the floor and its supports. It will be found convenient to support the floor boards upon frames about 5ft. or 6ft. apart—in the example shown 5ft. centre to centre.

A section through the above bath-house would then be as at Fig. 3. The floor boards over the verge should be supported on battens, say 4in. by $1\frac{1}{2}$in. (the thickness depending upon the amount of fall in the bath verge), scribed to the floor so as to present a level surface for the reception of the floor boards. One of these battens should run along the foot of the dressing-boxes, another along the edge of the pond (this one may need to be wider than 4in. in order to cover the gutter), and one should be fixed upon the verge at the end of the bath in continuation of each of the framed supports in the pond. The floor boards should be supported on a headpiece, which in its turn rests upon posts framed into a sleeper or sill lying upon the pond floor. These will be dealt with in turn.

Flooring Battens.

Taking into consideration weight, strength and cost, the most suitable wood for these and the whole of the framing will usually be found to be yellow deal. Under the regulations of the London County Council a space of 20in. by 28in. must be provided for every person in addition to gangways, &c., but in view of contingencies and the possibility of a packed public meeting an allowance should be made for a dense crowd. Assume a load per square foot of 120lb., and consider a strip of floor 12in. wide. Neglecting the width of the frames upon which the floor rests, and which are assumed to be 5ft. apart centre to centre, the live load would be $120 \times 5 \times 1 = 600$lb., equivalent to an ultimate load of 6,000lb., allowing a factor of safety of 10. Assuming the thickness of the floor to be $2\frac{1}{2}$in. and the weight per cubic foot of yellow deal to be 36lb., the dead load would be $\frac{2\frac{1}{2}}{12} \times 36 \times 5 \times 1 = 37\frac{1}{2}$lb., equivalent to an ultimate load of 262lb., assuming a factor of safety of 7. The floor must be assumed to be supported on the frames, not *fixed* to them, as the short screws used for the latter purpose are incapable of putting the floor battens into the condition of being fixed beams. The greatest bending stress would therefore be for a uniform load $\frac{Wl}{8}$, where W = the total load and l the span in inches. Taking the ultimate resistance to bending stress of yellow deal to be 6,000lb. per sq. in., the moment of resistance of the 12in. strip is $\frac{6000 \times bd^2}{6}$, so that

$$\frac{6000 \times bd^2}{6} = \frac{Wl}{8}$$

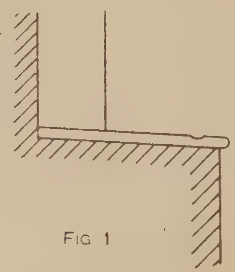

FIG 1

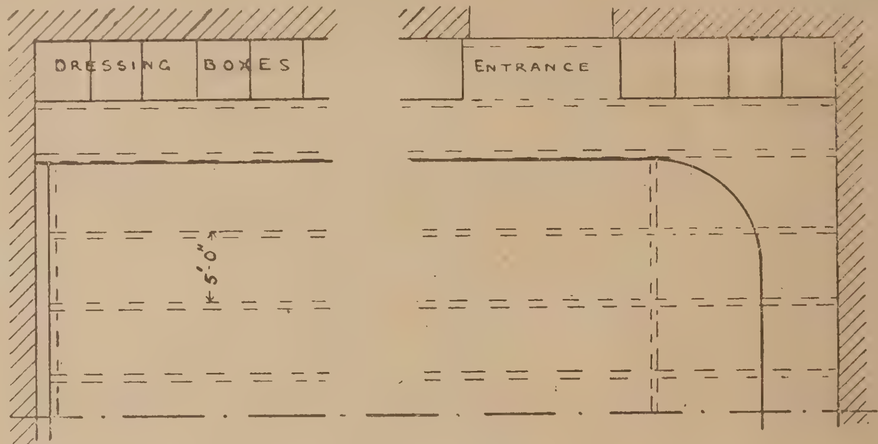

FIG. 2

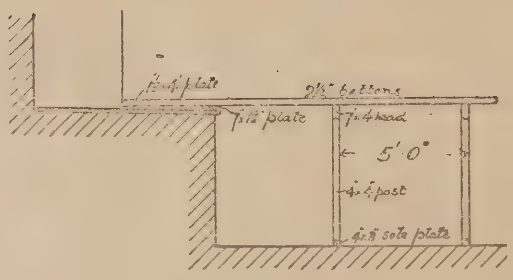

FIG. 3

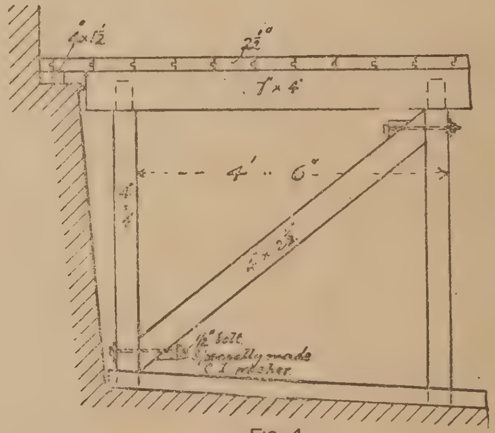

FIG. 4

MOVABLE FLOORS FOR PUBLIC BATHS: CONSTRUCTIONAL DETAILS.

or $$\frac{6000 \times 12 \times d^2}{6} = \frac{(6000 + 262) \times 60}{8}$$
whence $d^2 = 3{\cdot}9137$ and $d = 1{\cdot}98$in.

Considering the slight weakening by the tongued and grooved joint, the finishing of the floor and the fact that any defect greatly affects the strength of thin stuff, a 2½in. batten will be advisable and a width of 7in. probably the most convenient one, as with narrower, and consequently more, battens the labour of fixing is increased. Where evenness of floor surface is unimportant, wider boards may with advantage be used.

The deflection, though in this case unimportant, may shortly be investigated. Its amount is given by using the formula,

$$\Delta = \frac{12n \; Wl^3}{E \; bd^3};$$

n being a constant, which for beams supported at each end and uniformly loaded is $\frac{5}{384}$; W the total load; l, b and d the length, breadth and depth respectively of the beam; and E the modulus of elasticity. The total equivalent dead load is $(2 \times 600) + 37\tfrac{1}{2} = 1237\tfrac{1}{2}$ lb. Then substituting,

$$\Delta = \frac{12 \times 5 \times 1237\tfrac{1}{2} \times 60 \times 60 \times 60}{384 \times 1440000 \times 12 \times 2\tfrac{1}{2} \times 2\tfrac{1}{2} \times 2\tfrac{1}{2}} = {\cdot}155\text{in.}$$

The limit for a floor without a ceiling underneath is usually considered to be about $\frac{1}{30}$in. per foot of span, or in this case ·167; so that the floor is amply stiff enough.

Each batten should be tongued and grooved and secured to its bearer by a 3½in. screw at a point close to its grooved edge, and particular care should be exercised to ensure that every screw before insertion has been thoroughly well greased, or great difficulty in unscrewing will be experienced when the floor needs to be removed. The length of the floor boards may conveniently be from 15ft. to 20ft., care being taken to break joint as much as possible. The weight of a batten 20ft. long, 7in. wide, and 2½in. thick is about 80lb.

Headpiece.

This should be supported upon posts about 4ft. 6in. apart, centre to centre, so that the load upon a single span will be 120lb. per square foot over an area of 4½ft. by 5ft. for live load, plus the weight of the floor boards. The former will amount to 2,700lb., equivalent to 27,000lb. as an ultimate load, allowing a factor of safety of 10. The weight of the floor boards, assuming the weight per cubic foot of yellow deal to be 36lb., will be $4\tfrac{1}{2} \times 5 \times \frac{2\frac{1}{2}}{12} \times 36$, or 168·75lb., equivalent to, say 1,200lb. as an ultimate load, allowing a factor of safety of 7. These two loads together amount to 28,200lb. The beam would be most severely strained if in the condition of a supported beam fully loaded over its whole span, and assuming this to be the case the greatest bending moment is for a uniform load $\frac{Wl}{8}$ and the moment of resistance $\frac{6000 \times bd^2}{6}$.

Then
$$\frac{Wl}{8} = \frac{6000 \times bd^2}{6} \text{ or } \frac{48 \times 28{,}200}{8} = \frac{6000 \times bd^2}{6}$$
whence $bd^2 = 169{\cdot}2$.

Taking b as 4in., $d^2 = 42{\cdot}30$, whence $d = 6{\cdot}5$.

The section of the headpiece should therefore be 4in. wide and 7in. deep.

The defection is then in amount:—

$$\frac{12 \times \frac{5}{384} \times 2868\tfrac{3}{4} \times 54 \times 54 \times 54}{1440000 \times 4 \times 7 \times 7 \times 7}$$
$= {\cdot}14$in., which is not at all a large amount.

A 4in. by 7in. section is therefore amply strong and a convenient length for the headpiece would be about 20ft., as the weight of such a scantling would be about 140lb., easily carried by two men.

The question of the joint between two lengths of the headpiece will be considered with that of the joint between the head and the post.

Post.

The load upon each post will equal that upon the headpiece, namely, 28,200lb. ultimate.

The formulæ for the calculation of the strength of wooden struts give somewhat different results, so that it will be useful to compare two of them. The greatest length of any post will probably be about 96in.

Assume a post with a section of 4½in. by 3in.

By Gordon's formula the total load the post will resist, taking the safe resistance to compression as 6,000lb. per square inch and assuming both ends to be fixed, is

$$\frac{4\frac{1}{2} \times 3 \times 6000}{1 + \frac{1}{250} \times \frac{96 \times 96}{3 \times 3}} = \frac{27 \times 3000}{1 + 4{\cdot}096} = \frac{81000}{5{\cdot}096} = 15{,}895\text{lb.}$$

By Mr. Stoney's table the ratio of the length of the post to its shortest side being as 96 : 3, i.e. 32 : 1 for yellow pine, the breaking weight per square inch of section would be $\frac{87{\cdot}15}{144}$ tons, or $\frac{87{\cdot}15 \times 2240}{144}$lb.

The compressive strength of yellow deal compared with yellow pine being as 3 : 2, the above breaking-weight would be $\frac{87{\cdot}15 \times 2240}{144} \times \frac{3}{2}$ for yellow deal, and the total breaking-weight for the section 4½in. by 3in., $\frac{87{\cdot}15 \times 2240}{144} \times \frac{3}{2} \times \frac{9}{2} \times 3 = 27{,}452$lb.

If the length of the strut be reduced from 96in. to 72in. its strength would be, according to the above formulæ, 24,500lb. and 32,288lb. respectively.

The strength of the 4½in. by 3in. post is therefore, according to Gordon's formula, much less than is necessary, and according to Mr. Stoney's table a little less than sufficient. Taking into consideration the fact that the weights and costs of posts respectively 4in. square and 4in. by 3in., are proportionate to the sectional areas of the posts, namely, 16 to

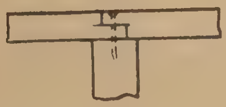

FIG 5

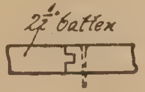

FIG. 6

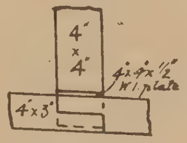

FIG 9

FIG. 10

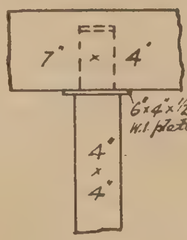

FIG. 7

FIG. 8

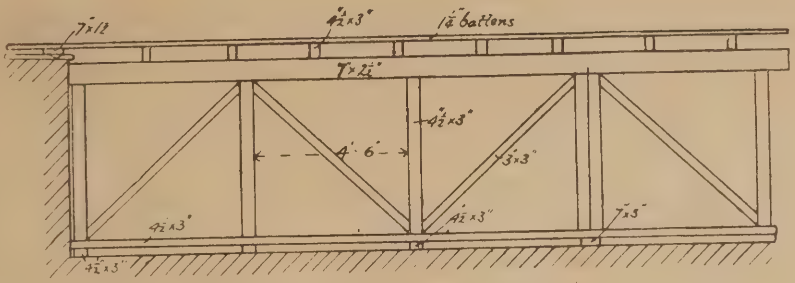

FIG 11

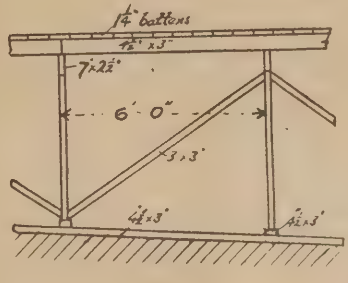

FIG. 12

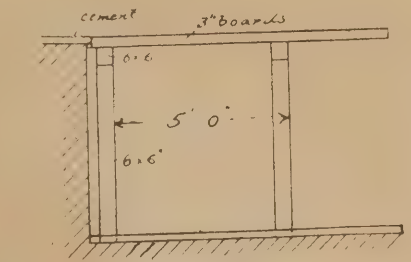

FIG 13

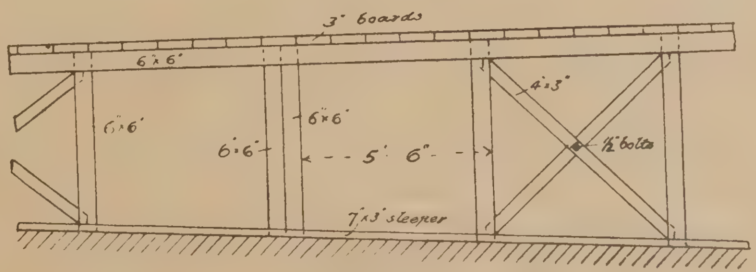

FIG 14

MOVABLE FLOORS FOR PUBLIC BATHS: CONSTRUCTIONAL DETAILS.

14, while the strength of the former calculated by Gordon's and Stoney's rules is 29,056lb. and 38,266lb. respectively and its section is much better adapted for bearing surfaces and connections, the advantage of using a post 4in. square is manifest.

Diagonal Struts.

As the floor battens have their sides and ends firmly fixed against the walls or boxes of the baths and are screwed to the framework, the bottom piece or sole-plate of which is firmly wedged against the sides and ends of the bath by means of 3in. square sleepers, there is no necessity for any diagonal struts, provided the timber is well seasoned, as in that case the shrinkage in the direction of the grain, of the floor battens across and of the framing along the bath, will be so small as not to affect the stability of the posts. If, however, the framework cannot be satisfactorily wedged up against the ends of the baths, to prevent rocking, a strut of 4½in. by 2¼in. stuff, or similar size, may be fixed as shown in Fig. 4. On no account should the strut be cut into, in order to dispense with the purpose-made cast-iron washer, and yet provide a square bearing for the nut, as in screwing up the latter there is a great risk of the portion between the cut and the end of the strut being sheared off.

Sole Plate.

The sole plate may be 4in. wide and 3in. thick, scribed where necessary to the floor of the bath and prevented from slipping laterally by struts of stuff 3in. square laid between the frames and between a frame and the side of the bath, and wedged tight.

Joints: Floor Boards.

The heading joints of the floor boards should be as shown in Fig. 5, and the edge joints as shown in Fig. 6. A screw should be fixed in each batten, about 1in. from the end of the tongue, as by placing it in this position the evenness of the floor is better ensured.

Head Pieces.

Assuming a $1\frac{3}{8} \times 5$in. tenon on the post, the mortise would weaken the head by about 8in., allowing for the mortise bearing on the shoulders, not on the tenon. Deducting 8 from the 28 sq. in. sectional area of the headpiece leaves 20 sq. in. to bear the shearing stress due to half the total ultimate breaking load of 28,200 lbs, equal to $\frac{14,100}{20} = 705$ lb. per sq. in., which is well within the limit, across the fibres. To distribute the load evenly over the top of the post a short cast-iron bearing-plate, say 6in. by 4in. by ½in., may with advantage be used, and the tenon on the post may also be made 3in wide. The bearing area is $(4 \times 4 - 3 \times 1\frac{3}{8})$ or $11\frac{7}{8}$in., and taking the ultimate resistance to compression at 6,000 lb. per sq. in. the total crushing load is 71,250 lb., which is two and a half times as much as the load upon the post, i.e. 28,200 lb. (ultimate).

The joint may therefore conveniently be as shown in Figs. 7 and 8.

The joint between the post and the sole-plate should be as shown in Figs. 9 and 10.

Trap Door.

It will be necessary to have a means of access to the spaces under the floor when this is in position, as these may often be used as storage places for chairs, &c. About 4ft. by 30in. square in the clear will usually be found sufficient for its size, and it may be formed as a loose lifting slab or hinged with a lock, though if the latter be fixed a dust-plate must be provided over the key-hole and all metalwork finished flush with the surface of the floor. The hinges should be strong and of the back-counter type. The lifting ring should, when released, fall flush with the surface of the door. The ledges may be two in number, and of 4in. by 3in. stuff, while the trimmers should be of about the same size and tenoned into the headpieces so as to weaken it as little as possible.

The position of the trap door will depend upon circumstances. If long articles are intended to be placed through it under the floor it must be arranged at such a distance from the end walls as to allow this. On the other hand, if the floor is likely to be used for dancing or the trap door for the storage of stage requisites, it may be better if placed close to an end wall.

Sloped Slabs.

As the movable floor is about 3½in. above the level of the permanent one, it will be necessary to provide sloped slabs from the line of the front of the dressing-boxes up or down to higher or lower floors, as the case may be, by means of which access is obtained to the bath. To get to a lower level the battens forming the slab should be splayed down to about 1in. at the doorway, supported there by a wrought-iron bar, and at their junction with the movable floor by a 1½in. splayed batten.

The cost of such a floor for a bathroom 59ft. long and 44ft. wide would probably be about as follows in London :—

	£	s.	d.
130ft. cube of fir in framing, 4s. 6d. ..	29	5	0
22 sq. super., 2½in. battens, 55s.	60	10	0
50ft. do. 2½in. do. in doorways, 9d...	1	17	6
30ft. do. Extra only for splayed bearers, 5d. 1½in. to 6in. high	0	12	6
20ft. do. Extra only for splayed bearer, 1s. 3d., wrought-iron plate screwed, and splaying floor battens	1	5	0
120ft. run 1½in. × 7in. plate scribed to floor, 4½d.	2	5	0
172ft. do. 1½in. × 4in. plate scribed to floor, 3d.	2	3	0
Lettering and naming each piece ..	3	0	0
No. 65 Cast-iron 6in. × 4in. × ½in. bearing plates, 6d.	1	12	6
„ 65 do. 4in. × 4in. × ½in. bearing plates 5d.	1	7	1
„ 20 do. Purpose made washers, 1s.	1	0	0
„ 20 ½in. bolts, 13½in. long, and washers, 1s.	1	0	0
„ 1 Extra for trap-door	1	10	0
Fees and expenses	15	0	0
	£122	7	7

The sections shown in Figs. 11 and 12 relate to a floor which recently came under the observation of the author. It is not designed in the manner just described, but a consideration of its points of difference may be interesting and instructive, especially as it is intended for the reception of considerable loads. No piece is framed into another, all the fixing being accomplished by means of spikes and dogs, and it will be observed that the heads have a very scanty bearing upon the posts, especially where a joint occurs, this latter being merely a butt joint.

Calculating the strength of the various members as affected by the loads adopted for the floor already described, the battens are just thick enough, but the floor joists should be 7½in. by 3in. instead of 4½in. by 3in., the heads 11in. by 2½in. instead of 7½in. by 2½in., and the posts 4½in. square instead of 4½in. by 3in. The cost of a floor framed in this manner, with stuff of the sizes shown, but capable of covering exactly the same area as the floor first described, would be £118 5s., but considering the very much less load the framing will bear this floor is seen to be not so economical as the first.

The sections shown in Figs. 13 and 14 relate to another floor in actual use. Calculating the strength of the various members as affected by the loads adopted for the floor first described, the boards are just thick enough, but the stretchers should be 6in by 8in. instead of 6in. square, and the posts need only be 4½in. square instead of 6in. square, so that the floor is evidently too weak in some parts and too strong in others. The cost of a floor framed in this manner with stuff of the sizes shown, but capable of covering exactly the same area as the floor first described, would be £152 15s. 6d. As its strength is governed by the weakest part, it is more costly and not so strong as the first floor, and moreover it is partly formed of frames, which are difficult to move and store away, while most of its parts are in excess of the weights which can be conveniently handled.

The Restoration of the West Front of Bath Abbey has now been practically completed at a cost of just over £3,000. The two ladders, with angels ascending and descending, in representation of Jacob's dream, the design for which was framed four centuries ago, have been restored, and, in the words of the Bishop of the diocese, "those who are now carrying out the work are merely translating into new stone the ideas that have been in some measure depicted there during the past 400 years."

THE GLASGOW INSTITUTE OF ARCHITECTS.

A MEETING of this Institute was held last week, Mr. John James Burnet, A.R.S.A., F.R.I.B.A., president, in the chair. It was intimated that the promised reply had not been received from the Royal Infirmary Committee to the protest lodged by this institute in connection with the recent competition, and the secretary was instructed to ask for a reply. A suggested programme was submitted for the visit to Glasgow in October next of the Royal Institute of British Architects on the occasion of their annual dinner, including a reception in their honour by the Corporation, lunch in the Exhibition, a visit to the University, Cathedral, &c.

A letter was submitted from the Corporation regarding the Woodside District Halls competition, stating that while the Corporation did not see their way to accept the suggestion of the Institute that in the event of a combined scheme of public reading-rooms and halls it be placed in the hands of the competitor for Woodside Halls, who had been recommended for employment by the assessors, without further competition, they felt that the competitors for Woodside Halls should receive some recognition, and they had accordingly agreed to pay to each of the authors of the three winning designs the sum of £10 10s., not as payment, but as recognition of the labour expended by them in connection with the competition.

To this letter the secretary had replied that, while recognising the good feeling expressed by the Corporation, the Institute could not but regret that their suggestion as to the employment of the architect recommended by the assessors had not been accepted, and pointing out that the main object of the institute in the representations they had made was to render the halls competitions more attractive, particularly to the younger members of the profession, and that they were strongly of opinion that the decision of the Corporation was unsatisfactory, and calculated to have unfortunate results in view of future competitions.

THE DEVELOPMENT OF DESIGN.

THE Edinburgh Architectural Society held a meeting on March 27th, when Mr. William Scott Morton delivered a lecture upon "Helps and Hindrances to the Development of Design." Mr. Morton began by mentioning that all artists were designers, but the distinction was to be made between the followers of art and the followers of fine art. A sketch of the history of design was given, from the middle of the nineteenth century, at which time there existed much dissatisfaction regarding design in architecture. The great exhibition of 1851 caused a great revival of Gothic architecture. The mediæval feeling possessed the public for a time, and then this gave way to the Renaissance. A healthy sign of the present day was the intercommunion of the arts and the artists.

There were at the present day a number of factors to contend with which did not exist in earlier days, such as centralisation in towns, the high value of ground (necessitating high buildings), the requirement of dwelling-houses for the working classes, the demand for large windows in shop premises, the growing evils of trade unionism, and the syndicates and combines which were breaking down personality.

The study of old work had a fascination, but those who devoted too much of their time to this were apt to become archæologists and drudges. The all-round men made the best designers. Good judgment was a fundamental law of good design. The form should be simple and the nature of the material should be considered. All detail should be congenial and enhance the main design. Mass and outline were more important than colour and detail.

Regarding colour, this climate was not favourable for high colour externally, and the materials at hand limited its use Veneers and marble were liable to decay and were objectionable from a constructional point of view. Internally any colour scheme was possible.

The various gradations of one colour were always pleasing. Stained glass was best when treated as a coloured screen and not as a picture.

Speaking generally on design, work was best done in sunlight and in peaceful circumstances, free from as much distraction as possible. Steadfast and patient study was still required, and only through this could strength come.

ST. MARY'S ABBEY, YORK.

THE EXCAVATIONS.

MR. BRIERLEY, who is superintending the works of excavation now proceeding at St. Mary's Abbey, York, under the auspices of the Yorkshire Philosophical Society, has furnished some particulars of the progress of these works.

It has for some time past been felt that the site of the chancel of the Abbey Church ought to be subjected to the same careful examination as that bestowed on the rest of the Abbey site, and hopes were entertained that the original pavement and perhaps even the high altar might be found in the course of exploration. But the excavating has so far been disappointing, for no trace of the pavement or of its foundation has been discovered, and nothing of interest has been found except a few moulded stones and one or two fragments of tiles and glass which had been thrown in with the soil and débris.

In continuation of this work, the Council have had the foundations of the main walls at the east end of the choir opened out. They are found to be of great size and solidity, and built of large blocks of stone, many of them moulded and evidently parts of the earlier church.

The foundations of the east wall are 9ft. wide, and where opened out against the north-east pier they are found to go down about 7ft. below the ground-floor level, and to be evenly faced on the inside with chiselled stone, which would suggest that there has been a chamber or vault there.

The Council are desirous of carrying on these excavations, for even if no objects of striking interest are found in the course of excavation, the clearing of the ground will reveal the ground plan of the chancel and enable the visitor to realise its extent and the magnitude of its enclosing walls. But unfortunately the income of the Society, hampered as it is by the repayment of a heavy debt, does not leave much margin for scientific work after payment of necessary expenses. It is to be feared that the work cannot be completed without outside pecuniary help.

THE TECHNICAL INSTITUTE AT CONSETT, NEWCASTLE.

THE new Technical Institute, which has been built and finished at a cost of about £5,000, was opened recently. The foundation stones were laid on Saturday, December 3rd, 1898. The Institute occupies a site at the north end of the town, facing into Park Road—the main thoroughfare between Consett and Blackhill—and adjoins the grounds of the Public Park. The building is set back from the road 16ft. The general design of the premises is a plain treatment of Renaissance, the exterior walls being faced with deep-red pressed brick and Dunhouse stone dressings. The principal entrance has a deeply recessed arched doorway, with carved spandrils forming the chief feature in the façade, and leads through a vestibule, with ornamental glass screen, into the entrance hall, from which direct access is obtained to the whole of the ground-floor rooms. Right and left of the entrance are ladies' and gentlemen's retiring rooms, with lavatory accommodation. Immediately opposite is the secretary's or head-master's room, with large store-room adjoining. On the left side of the hall are two class-rooms, and on the right side of the hall is the physics laboratory. The whole of the corridors are of fire-proof construction. The first floor consists of a chemical laboratory, store-room, balance-room, and preparation-room, lecture-room, class-room, and an art-room. The second floor has been specially designed with a view of being adapted for use as an art-room, with store-room, cloak-room, &c. Detached from the main building is a large room, 47f. by 16ft. wide, to be devoted to the teaching of manual instruction. The whole of the premises have been furnished by the North of England School Furnishing Company. The general contractor for the building is Mr. Edward Taylor, of Durham, and the painting was entrusted to Mr. Joseph Siddle, of Consett. The wrought-iron work has been executed by Mr. J. R. Crimson, of Gateshead; and the stained glass by Messrs. Reed and Millican, of Newcastle. The architect is Mr. C. E. Oliver, F.S.I., of Consett, and Mr. John Simpson, of Blackhill, has acted as clerk of works.

HOW THE ALDERSHOT BARRACKS ARE TO BE LIGHTED.

THE general scheme for electrically lighting the various barracks at Aldershot has been drawn up by the Commanding Royal Engineer, Colonel W. Pitt, and is divided for the purposes of contract into twenty-six subdivisions. In addition, the laying of cables from the generating station to the barracks will form a separate contract. Of these subdivisions, the first four, namely, the wiring and fitting up of Albuhera, Barossa, Corunna and Maida Barracks, have been given out to contract to four different firms, and it is expected that this work will be completed by the beginning of May, says the "Aldershot News." The firms employed are Messrs. Drake and Gorham, Edmundson's Company, Foot and Milne and the National Electric Wiring Company, all of London.

The system adopted for the wiring of the barrack-room is what is known as the steel conduit, the wires being carried in steel pipes, specially enamelled inside and out. For the ordinary rooms four lights, each of 8 candle-power, are provided, but in the T-shaped barrack-rooms there will be five lights, suspended at equal distances along the ceiling.

On the ground floor the pipes carrying the wires are run along the ceiling, but in the upper floors the wires are carried between the roofs in pipes, and then let down through the ceiling. The greatest care has been taken to ensure the fittings being of a character to withstand rough usage. There is nothing fragile about them. The globes will be suspended from the ceiling on what is known as a stiff pendant, that is, the lights will be screwed to the end of a 2ft. steel pipe carrying the wires.

In the officers' quarters the same system of wiring is adhered to, but the fittings and shades will be of better material and design, and the pendants will be flexible.

The lighting of the double canteens has proved a rather bigger job. All the wires are taken up into the roof by steel pipes, and from these 10 treble lights of three 8-candle-power lamps will be suspended to light the hall. All the other offices and institutions of the barracks will be suitably lighted, considerable ingenuity having been shown in lighting the prisoners' rooms and cells, so that their inmates cannot tamper with or damage the lamps.

The Generating Station.

This will be situate just north of Thorne Hill, and near the new Supply Depôt Abattoir. The installation will be laid down for 24,000 lights, and as the number of lights required for the twenty-six subdivisions so far mapped out is 14,000, there will still be provision for 10,000 lights being supplied from the station beyond the number required. All the cables and outside connections are to be laid underground, in glazed earthenware pipes, and this system is to be observed even between the blocks of barracks, so that nowhere in the camp will danger arise from exposed live wires. It is not intended to light the barracks in Wellington Lines or the Cavalry Brigade by electricity, as these are already provided with gas. Colonel Pitt has the supervision of the work, and is assisted by Mr. Mayne as advisory electrician.

Correspondence.

The Name of London's New Street.

To the Editor of THE BUILDERS' JOURNAL.

COCKERMOUTH.

SIR,—I have been much interested in the suggested names for the new street to be formed from Holborn to the Strand. Many things have evidently been carefully considered by the inventors or discoverers of these names, and patriotism has been by no means omitted. But there is one important consideration to which, I think, scarcely sufficient attention has been given. The future inhabitants of the thoroughfare are certain to receive many telegrams in the course of their business, and this is the basis of my suggestion. I would urge that whether the name be royal or military in its associations, or whether obtrusively municipal, it be limited to one word, and that a word of not more than ten letters.

The simplicity of a telegraphic address such as 48 Cheapside or 257 Strand is apparent. But follow the conventional and call a street, say, Queen Street, and every telegram sent to that thoroughfare requires an extra halfpenny. Add a specific monarch—call it Queen Anne Street—and the fine runs to a penny. Divide the street into two sections and you have Queen Anne Street North. Nor is this the limit of possibilities, for there are such things as back streets running parallel to the main artery of traffic, and called (at least in certain provincial towns I know very well) "Back Such-and-such Street." Indeed, I could name a particular thoroughfare, several hundred miles from London, where there is even "Back South John Street West." The Post Office should be kind to the town that so liberally helps it to a revenue at the cost of the long-suffering public.

I do not venture to specify a name; there are names enough to choose from already: but there are some to avoid, and a visit to some of the older towns in the country would discover names to be avoided. For instance, there is Shrewsbury, where one street is poetically named "Dogpole." Other towns are bewildering in their multiplicity of "Gates." I forget, if I ever precisely knew, the number of these in York. I know that the term has its uses, for if you call a thoroughfare Rivergate you may safely surmise that it leads to the river at some stage of its career as a street, and where that most-frequently used word "Briggate" appears you may look for a bridge over something, big or little.

However, when the time comes to decide on the name of London's new street it is hoped that the telegraphic limitation of ten letters will not be overlooked.—Yours truly,

ULYSSES.

Size of Gas Pipes.

To the Editor of THE BUILDERS' JOURNAL.

HAMILTON, N.B.

SIR,—With reference to the enquiry on page 122 of your issue for March 20th as to the size of gas pipes, a very good rule is to take $\frac{1}{8}$in. super. as the area of a pipe sufficient to supply one light. Thus, $\frac{1}{4}$in. will supply up to three lights: $2 \times 2 \times 0\ 7854 = 3{\cdot}1416$ superficial eighths of an inch—$\frac{3}{8}$in. $3 \times 3 \times 0{\cdot}7854 =$ fully seven lights; $\frac{1}{2}$in. pipe would supply $4 \times 4 \times 0{\cdot}7854$—twelve lights. This, if remembered, saves the trouble of consulting tables.

Yours truly,

CLERK OF WORKS.

A new Church at Prestonfield is proposed to be erected in Dalkeith Road alongside the present iron building. At present only a part of the building is to be erected. The plan includes a nave (the part now proposed to be built), capable of accommodating 500 persons, without galleries; a north and south transept, and a circular apse, which will give additional accommodation for 300, thus making a total of 800. On the south side and near the west end of the church there will be a tall circular tower about 15ft. in diameter. This tower will on the ground floor form an entrance porch, having a projecting doorway to the outside. The architects are Messrs. MacGibbon and Ross.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor The querist's name and address must always be given, not necessarily for publication.

Early-English Church Planning.

Ripon.—Anglo-Norman writes: "Did any of the cathedrals or churches erected in England during the eleventh or twelfth centuries possess choirs (as they are now designated) equal, or nearly equal, in length to their naves?"

If by "choir" is meant the east limb of a cross-planned church, querist will find that while in our great Benedictine abbey-churches of the latter half of the eleventh century this was usually as to length from about one-third to one-half of the west limb, Carilephs Durham made it fully two-thirds, and Gundulphs Rochester equal to or longer than the nave. But it must be remembered that in these cases the buildings of the naves came later, and until the west ends were set up, the lengths were probably undetermined. However, Ernulph's rebuilding of Canterbury quire, in 1093, set it out to be definitely longer than the nave of Lanfranc; and, probably contemporary, at Lewes came a similar quire addition to the Cluniac church. The canons' churches of the twelfth century, such as St. Martin's and Bradsole, Dover, were often built with quires as long as, or longer than, the naves; and at Kelso the Tironensians attached only a single nave-bay to their spacious quire and transept, though the design here is quite complete. It is doubtful if Hexham ever had a nave at all, though "restorers" are now thinking of "restoring" it. St. Andrews and Tynemouth should be noted as having long quires of the twelfth century, though not all of one date. By the end of the twelfth the secular cathedrals, Hereford, Chichester, Lincoln and possibly York, had built to the east of their crossings at greater length than to the west.

EDWARD S. PRIOR.

Constructing Brewer's Coolers.

Potton.—Kilderkin writes: "Which is the best method of putting together a brewer's cooler so as to ensure its being liquor-tight? The size of the coolers is to be 10ft. by 17ft. inside and 7in. deep. The accompanying sketch (not reproduced) shows the proposed method—the bottom pinned to bearers with oak pins and nailed to sides and ends. We believe white cedar is the wood often used, but we would be glad to know if best yellow deal is less suitable."

We should strongly advise querists not to do a work of this kind without previous experience. Ordinary wooden vessels for cold beer or water are comparatively easy to construct, but with a large shallow vessel for hot beer the difficulties become very great. It is not so much the timber as the method employed. Nothing in the nature of rebates, tonguing, halving, or mitring is allowable; an absolutely plain square joint must be used, and it is in making this that the difficulty arises. We should certainly not advise white cedar for this purpose; nothing but the best picked yellow deal can be used. It would be far more satisfactory for querists to get the work done by regular back and vat makers.

BREWER.

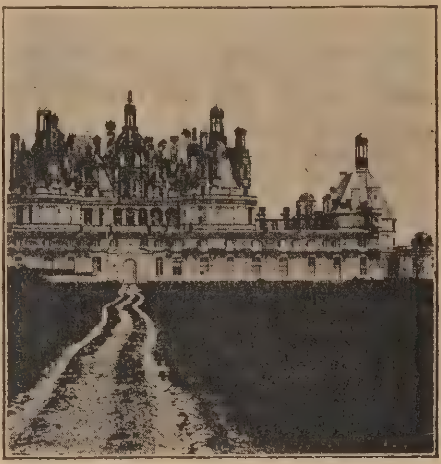
Fumigating Oak.

Nottingham.—Querist writes: "What is the method of fumigating oak, and in what way can this treatment be detected?"

The method of fumigating oak was described on page 392 of the Builders' Journal for December 19th last. This practice, however (meaning that connected with modern "antique" furniture), is much to be deprecated, as it is essentially wrong in principle.

An Architectural Tour in the Loire Valley.

Glasgow.—E. E. M. writes: "A party of architectural students propose visiting the châteaux in the Loire Valley this autumn. Kindly recommend any books which could be studied previously, and give any information as to the best buildings to visit, where to write to for permission to sketch, how to reach them, and where to put up."



CHÂTEAU DE CHAMBORD.

STAIRCASE AT BLOIS.

The only first-rate book to consult is "Palais, Châteaux, Hôtels et Maisons de France du XV^{e}. au XVIII^{e}. Siècle," by C. Sauvageot. It is a large and expensive work, full of beautiful illustrations, and can be obtained from Mr. B. T. Batsford, 94 High Holborn, W.C. The district of the Loire Valley is one of the most interesting in Europe, but the tour as a whole can be improved by following different routes on the outward and homeward journeys beyond Paris. We would suggest that the principal places at which residence might be taken up should be Chartres, Le Mans, Angers, Tours, Blois and Orleans, in this order, and that a hotel be written to in advance at each place, asking terms and stating approximately the accommodation required and the probable duration of the stay. Foreign reply postcards should be used, price 2d. each at any post-office. It is not always so easy to know who to write to for permission to sketch. Where there is a cathedral it is best to address to the "Doyen de la Cathédrale," and it is always wise to write to the Mayor (Maire) respecting buildings held by the municipality. Some of the great châteaux belong to the State and permission to sketch in them should be sought through the English Ambassador at Paris, while for the privately-owned châteaux it is necessary to wait till you reach the neighbourhood and then to write to the owner, whose name you ascertain locally. The R.I.B.A. travelling card is often of great assistance, and reply postcards should be sent whenever an answer is required, remembering that ordinary English stamps and postcards are useless for the purpose. At Chartres stay at the Hôtel du Grand Monarque. The cathedral is the one great architectural object, with its fine triple doorway and its magnificent stained glass. Le Mans (Grand Hôtel) also possesses a remarkably fine cathedral but little known to English students, and the two fine churches of Notre-Dame de la Couture and Notre-Dame du Pré. Angers (Grand Hôtel) is even less known. The cathedral has a good west door and carved pulpit, to say nothing of King René's bénetier. Of several other churches the most important is S. Serge, on account of its Gothic mouldings, while there is much material for the sketch-book in the Hôtel Pincé and other old houses. Tours (Grand Hôtel de Bordeaux) is the centre of a very rich district, but it is the headquarters of an army corps, and so care must be exercised in sketching not to arouse suspicion. Its cathedral contains part of an altar piece from S. Zeno, Venice, and has good towers. In the town are many sketchable old houses, including that of Tristan l'Hermite, and the abbeys of St. Martin de Tours and Marmoûtier. Making Tours a centre, Plessis-lès-Tours should be visited from it, as well as the Châteaux of Azay-le-Rideaux, Chinon, Loches, Cinc Mars, and Chenonceaux, the station for the last named being Véretz. Of these châteaux the first and last named are the most important architecturally. Château d'Amboise might be visited as a day-excursion *en route* to Blois (Hôtel d'Angleterre), where, besides the well known Château, there is a fine old building in the Rue St. Honoré known as Hôtel d'Alluye, and a seventeenth-century cathedral. The Château de Chambord can be visited from Blois, the nearest station being Bracieux-Chambord, on a branch line. Orleans (Grand Hôtel St. Aignan) contains much of great interest, especially the old Hôtel de Ville and the houses of Jeanne d'Arc, Agnes Sorel, Francis I., and Diana of Poitiers, besides the cathedral and some good churches. To sketch over the district thoroughly would occupy several months, but even a hasty traverse would be of enormous value to any student. Information as to trains will be found on pages 42, 38, 39 and 34 of the Continental edition of Bradshaw, price 2s.

It is also possible to reach the district by way of London, Newhaven and Caen, whence there is direct train service to Le Mans. This is rather cheaper than passing through Paris.

G. A. T. M.

Elementary Geometry.

London, E.—W. H. A. writes: "Kindly name a book containing the principles of elementary geometry."

Both Angel's "Elementary and Advanced Geometry" (1s. 6d. and 8s. respectively) should be thoroughly mastered. The books can be obtained from Mr. B. T. Batsford, of 94 High Holborn, W.C.

Buildings in and around Shrewsbury.

Hastings.—Nancie writes: "Are there any places of architectural interest in and around Shrewsbury, Salop? I should like to know of those places of particular interest to an R.I.B.A. probationer preparing for intermediate examination."

See an article on Shrewsbury in our issue for September 26th last.

Air and Floor Space in Lodging-Houses.

Ripley Down.—Air Space writes:—"What amount of floor space *per person* is generally allowed for sleeping-rooms in model lodging-houses? Also how many cubic feet of space per person; also how many cubic feet of air per person per hour?"

In common lodging-houses 300 cubic feet of air-space is required per person, the amount having been raised at intervals from 240 cubic feet. The Local Government Board Model By-laws recommend 400 cubic feet in registered tenement rooms, both for living and sleeping. Children under ten years of age are allowed half the amount. The Army Regulations require 600 cubic feet per head, and physiologically 1,000 cubic feet per head is desirable. No height above 12ft. from the floor is reckoned as effective space, and the minimum floor space is

30 square feet per person. By the Factory and Workshops Act (1895) 250 cubic feet is the minimum allowance per person during the day, and 400 cubic feet during overtime work. A man at rest requires 3,000 cubic feet fresh air per hour to keep the carbon dioxide (CO_2) down to 0 06 per cent. and secure sufficient purity. In full work twice this quantity is required, and if working under pressure in a caisson three times this quantity is necessary. The minimum window-surface is one-tenth the floor area. Air entering near the floor should not exceed 2ft. per second, but if admitted higher up 5ft. per second may be allowed for inlets, and 10ft. per second for outlets. The usual allowance is 20 cubic feet fresh air per minute for each person, and three times that quantity for each gas jet. An open fire in a room abstracts 600 cubic feet of air per minute, mainly from the bottom of the room, although it is the upper portion that requires removal.

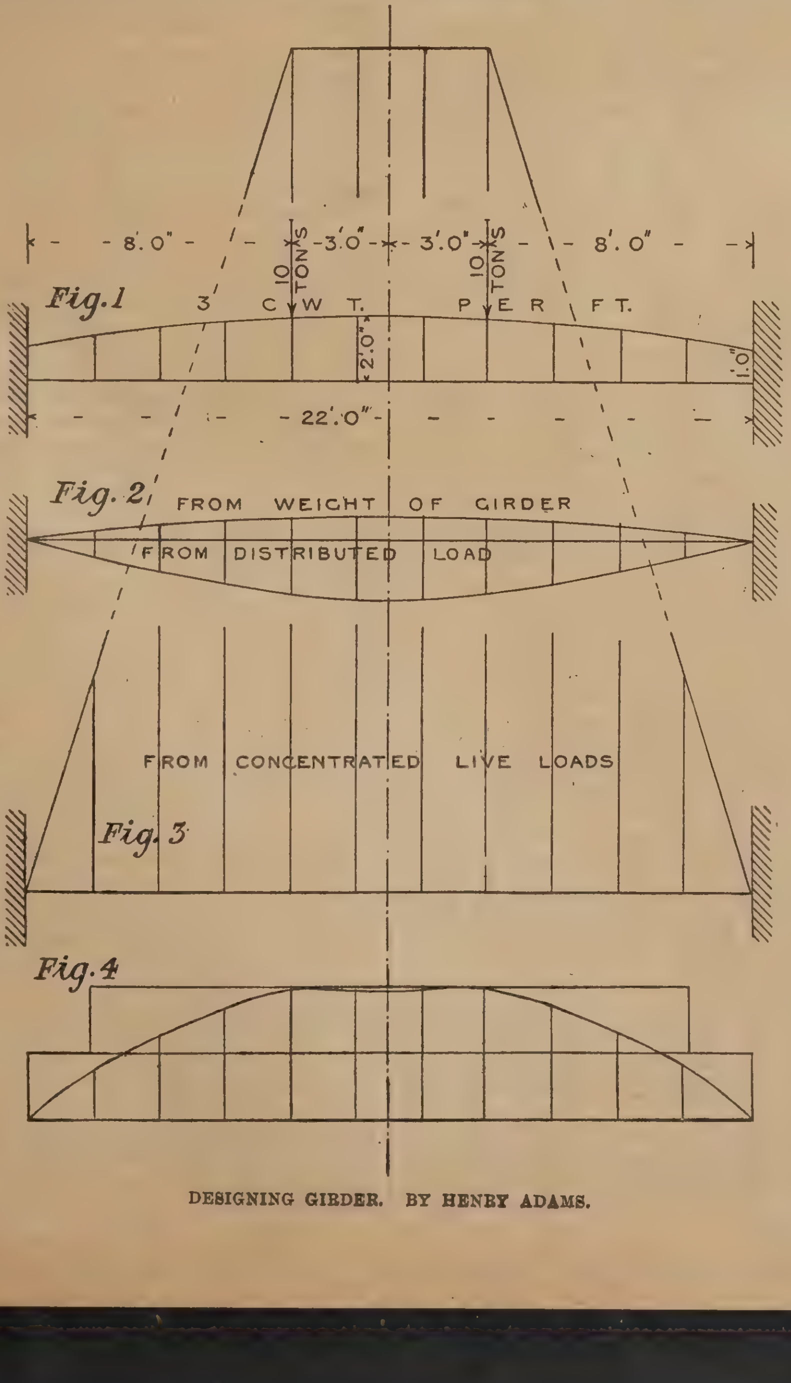
HENRY ADAMS.

Designing Girder.

TODMORDEN, YORKS.—C. writes: "Kindly state how to determine the size of a girder necessary to comply with the following conditions: Span, 22ft. clear; ends fixed in between two retaining walls—vertical; dead distributed load, 3cwt. per foot, not including girder; two 10-ton live loads, one 3ft. on the left and the other 3ft. on the right of the centre of the girder; the top of the girder at the ends must not be higher than 1ft. above the bottom of the girder at the centre, and the depth at the centre must not exceed 2ft.; the girder will on one side have to support steel girders laid at right angles to it at 3ft. centres; these are included in the distributed load mentioned. I can get a built-up steel or wrought-iron girder to satisfy these conditions, but it becomes heavy, and I think a bowed girder whose bottom flange will be lower at the ends than at the centre would be more economical, either in cast-iron, wrought-iron, or steel."

This is rather a peculiar case, and it would have been of some assistance in designing if the circumstances had been more precisely stated. The girder can be made hog-backed, with a straight soffit, or only the ordinary camber. Let Fig. 1 be the general arrangement. Fig. 2 will be the diagram of bending moments from distributed load, allowing $1\frac{1}{4}$ tons for weight of girder. The height in centre of parabola representing bending moment from weight of girder will be $\frac{Wl}{8} = \frac{1\frac{1}{4} \times 22}{8} =$ 3 4375, say, 3·5 ft.-tons, and a suitable scale will be $\frac{1}{10}$in. per ft.-ton. If the distributed load is brought on the girders by cross girders at 3-ft. intervals, it will not be quite identical with a uniformly distributed load; instead of a parabola for bending moment it would be a polygon approximating to a parabola, so that there might not be a great difference. Assuming the load as equivalent to 3 cwt. per foot run uniformly distributed, the depth of parabola in centre will be $\frac{wl^2}{8} = \frac{3 \times 22 \times 22}{8} = 181{\cdot}5$ ft.-cwts., or $\frac{181\ 5}{20} = 9\ 075$ ft.-tons, which may be added below the other in Fig. 2. Fig. 3 shows bending moment diagram for the two concentrated live loads assumed as equivalent to $\frac{8}{5}$ of similar dead loads = 16 tons each. The maximum bending moment for these will be 16 by 8 = 128 ft.-tons. It is now necessary to combine these into one diagram, but it should be done in such a way as to make it available for determining the thickness and length of flange plates. Measure up the combined value at 2ft. intervals and mark on diagram, divide each by the proposed depth of girder in feet at that point, and this will give the total stress in flanges at each point. The total bending moment at any point (M) divided by the depth of girder in feet at that point (d) will give the total stress in flange, and this divided by the working intensity of stress (f) will give the sectional area. The sectional area divided by breadth of flange in inches (b) will give the thickness, and this $\left(\frac{M}{dfb}\right)$ being worked for each point the diagram will then represent the thickness of top flange throughout the girder. Say working stress on mild steel 6 tons per square inch of gross sectional area, and breadth of flange 1ft., then the diagram will be as Fig. 4 and the plates as marked. The area contained between the curve and base line is the theoretical material necessary in a solid homogeneous flange, and the outer plates have therefore to be continued far enough beyond the curve to make a secure connection. The bottom flange will be the same figure inverted.

HENRY ADAMS.



DESIGNING GIRDER. BY HENRY ADAMS.

Notice under London Building Act, 1894.

LONDON, S.W.—J. H. T. W. writes: "My client proposes to build an external wall against a neighbour's external wall now forming the boundary of his property. Is it necessary to give the adjoining owner notice of this intention under Section lxxxvii., 5 and 6? The clause says 'may,' not 'must' or 'shall,' serve notice on the adjoining owner."

Unless notice be served under sub-section 5, the privilege of extending footings under the neighbour's wall cannot be claimed under sub-section 6. At the same time it is generally expedient to translate "may" as "must" in all such cases, even where this privilege is not sought, in order to give the adjoining owner the opportunity of objecting, if, in his opinion, the erection of the new wall would be likely to damage his old one by lateral pressure—for instance, against a low cellar wall—and for the purpose of avoiding future litigation.

G. A. T. M.

Lime Cartridges for Blasting.

LONDON, E.C.—T. W. & Co. write: "Could you inform us who are makers of compressed lime cartridges as used in stone quarries for blasting purposes?"

C. Sebastian Smith, F.S.I., Shipley, Derby, manufactured lime cartridges, but ceased manufacturing several years ago in consequence of the Government not objecting to the use of high explosives in fiery mines, notwithstanding the fact of their giving off flame. The work done by these cartridges was exceedingly good and of course perfectly safe, but being more cumbersome than explosives it was impossible to obtain a sufficiently constant demand to make it worth while keeping the factories working. Doubtless if you write to Mr. Smith he can furnish further details.

W. MILLAR.

Competitive Examinations Under Government.

LONDON, E.—W. R. B. writes: "What appointments are open to competition under the Government and municipal bodies for surveying (quantity or otherwise) and civil engineering? What are the necessary qualifications, or where can particulars of them be obtained?"

The principal appointments of this nature under Government are those of Assistant Civil Engineer, Admiralty; Assistant Surveyor, Royal Engineers; and Assistant Surveyor, Admiralty. These are obtained by open competitive examination, particulars of which will be supplied gratis by the Secretary, Civil Service Commissioners, 68 Victoria Street, S W., who will also supply details of the examination for County Surveyors in Ireland. Appointments under municipal bodies are, as a rule, obtainable only by application, supported by local influence.

G. A. T. M.

Keystones.

A new Welsh Church at Pentrebach, near Merthyr, dedicated to St. James, has been opened. Mr. John Griffiths was the contractor, and Mr. Penry Williams the architect.

A Church Institute at Portsea in connection with St. George's Church is to be erected from designs by Mr. G. Vernon-Inkpen, C.E. The tender of Mr. A. W. Bevis, of St. Thomas's Street, Portsmouth, has been accepted for the work at £735.

The Portman Market, which has been constructed close to the terminus of the Great Central Railway, will be opened by the Mayor of Marylebone on April 18. The building has been erected at a cost of about £40,000.

A new Mission Church at Barnsley, to be dedicated to St. Mary Magdalene, is being erected, to seat 120, in the parish of St. Peter's. There will also be a schoolroom, made so that the rooms can be thrown into one, giving accommodation to about 400.

At St. Endellion's Church, Wadebridge, a reredos is to be erected in memory of the late Queen Victoria at the east end, with such other necessary improvements in the chancel as will correspondingly beautify it. The church itself is in a good state of preservation. The estimated cost is £100.

A new Wesleyan Mission Hall at Bradford is to be erected in Leeds Road, Eastbrook, from plans by Mr. W. J. Morley, F.R.I.B.A., of Bradford, who also designed the Wesleyan Mission Hall at Manchester. The ground floor front will be occupied by shops. The accommodation provides for a large principal hall, and a considerable number of rooms for the auxiliary institutions which grow out of such a mission.

Bedale Parish Church has just had a memorial erected in memory of the late Rev. John George Beresford, who was rector of Bedale for 38 years. The memorial consists of two choir screens of solid oak, which have been designed by Mr. Hodgson Fowler, architect, of Durham. The work has been carried out by Messrs. Beaumont and Sons, of Stamford. A fragment of the old rood screen which formerly spanned the chancel arch and was discovered recently, has been incorporated in the panels of the new screen on the north side of the church.

New Royal Exchange Frescoes.—No fewer than three additional frescoes for the decoration of the Ambulatory of the Royal Exchange are in progress, and at least two others are projected. Mr. Frank Brangwyn is preparing one of "Modern Commerce," which will form a pair with the late Lord Leighton's "Ancient Commerce," in which the Phœnicians are trading with the early Britons. The fresco of Mr. E. A. Abbey, R.A., which is illustrative of the historic quarrel between the Merchant Taylors' and the Skinners' Companies will be erected in its place in the course of the present year. For the third one, Mr. Chevalier Taylor is at work on a design on the subject of the banquet to the five Kings in the reign of Edward III. All these frescoes are fixed by a comparatively new process known as "Marouflage," and are painted in a medium technically termed spirit fresco.

A new Church for North London.—A new London Baptist Association church and schools at Muswell Hill, N., is to be erected. The seating accommodation will be about 900 persons. The ceiling will be vaulted in woodwork. A tower terminated with a spirelet will form a prominent feature in front. The buildings are to be faced with red brick with Bath stone and Coatessey dressings. The style adopted is Late Decorated Gothic. Messrs. Matlock Bros.' (Wood Green) tender of £6,408 16s. has been accepted for the work. The architects' estimate was £6,780. The design was selected in a recent competion limited to six architects, the alternative designs by the same authors, "Greek Cross" and "Twentieth Century," being placed respectively first and second. The architects of the selected design ("Greek Cross") are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5 Clement's Inn, Strand, W.C.

In the Parish Church of Wooburn, Bucks, a new reredos has been erected.

The Memorial of the late Bishop Creighton is to take the form of a standing figure in marble in the act of blessing. Mr. Hamo Thornycroft, R.A., is to be the sculptor.

Wansford Church is to be restored. It is intended to erect a new chancel, vestry and organ loft, underpin the tower and reroof the nave. The cost will be about £1,500.

The Bells of St. Peter's Church, Finsthwaite, are about to be overhauled and put into proper order by the makers, Messrs. Harrington, Latham and Co., Earlsdon, Coventry.

The Edinburgh Architectural Association recently visited the Victoria Cabinet Works, Kirkcaldy, of Messrs. A. H. M'Intosh and Company. The works are perhaps the most extensive of their kind in Britain. In the afternoon the Adam Smith and Beveridge Memorial Halls were visited, where Mr. James B. Dunn, the architect, described them.

A new Church for Blackley.—The Rev. W. Schofield Battersby is appealing to the loyal ladies of England for 40,000 crowns, or 10,000 sovereigns, to enable him to build a Victoria Memorial Church in the parish of Holy Trinity, Blackley, Lancashire. Of the £10,000 required £8 000 is to be spent on the church, £1,500 on a rectory and £500 on a temporary building.

At Northmolton Church a lych gate has been erected. The walls are of local stone, the dressings of Dartmoor granite, the woodwork of English oak, and the roof of tiles. The masonry has been done by Messrs. Sanders and Son, of Southmolton, and the oak work by Messrs. Harry Hems and Sons, of Exeter. The architect was Mr. James Crocker, F.R.I.B.A., of Exeter.

A New Drill Hall at Blaydon, erected for the use of the Blaydon and Winlaton companies of the 5th V.B.D.L.I., was formally opened last week. The structure, which is of stone, and situated midway between the two villages on a site given by the owners of the Towneley Estate, has been erected at a cost of about £1,500. Mr. M. H. Graham, of Newcastle, was the architect.

A New Quarter Sessions Court at West Ham is being erected on a site adjoining the Borough Police Court in West Ham Lane and will comprise an extension of the present Police Court, together with a new Coroner's Court in addition to the Quarter Sessions Court. The buildings were designed by Mr. Lewis Angell, the late borough engineer, and are being carried out under the supervision of Mr. Morley, the present borough engineer. On the ground-floor the buildings will contain a court-room and rooms for the recorder and magistrates as may be required, counsel and solicitors' rooms, a warders' room, and rooms for prisoners. On the first floor there will be rooms for the jury, grand jury, and several offices. The second floor will contain offices for the assistant clerk, and there will be a mortuary at the rear with a separate ambulance entrance. The contract has been let to Messrs. Gregar and Son, at £10,839.

The Paris Exhibition.—Certain of the buildings erected for the late exhibition are still awaiting demolition, their proprietors being greatly embarrassed as to how to dispose of them. As the result of the breaking up of the monster show the market is glutted with old building materials, and the owners of the pavilions are reduced to paying heavy sums to have their property carted away. A characteristic story is being told of the fate of one of the most admired of the national pavilions in the Rue des Nations, an elaborate edifice the outlay on which ran into several thousand pounds. The Commissioner-General of the country to which the pavilion belonged informed his Ambassador, with much satisfaction, that he had concluded an excellent bargain. "I have sold our pavilion," he explained, "for £36." The Ambassador admitted that the transaction did not strike him as particularly brilliant until the Commissioner added that if he had not found a purchaser for the pavilion he would have had to pay £600 to have it demolished.

Mr. Charles Stanyer, master decorator and paperhanger, &c., 9 Newgate Street, Chester, died last week at the age of 66 years.

The People's Palace Architectural Society held its second annual meeting at the People's Palace, Mile End Road, E., on March 23rd, Mr. F. R. Taylor in the chair, when officers for the ensuing year were elected.

The Theatre at Southborough, near Tunbridge Wells, is controlled by the Urban District Council, and helps to reduce the rates. The building was erected at a cost of £6,000, Sir David Salomons contributing one-half and the ratepayers the other. The first year's working has brought in a revenue of £200, and after a small sum has been deducted for expenses the remainder will go to the relief of local taxation.

M. Cazin, the French landscape and historical painter, died last week. The son of a Boulogne doctor, he studied under Lecoq de Boisbaudran, and was professor at Trélat's School of Architecture and next at Tours. After the war of 1870 he was for five years teacher of drawing at South Kensington, and after his return to France his pictures at the Salon attracted increasing notice. Since 1883 he has devoted himself to landscapes.

The Crossley Hospital at Mirfield for the isolation and treatment of scarlet fever patients has been enlarged by the addition of a temporary structure of match-boarding and galvanised iron. The additions consist of two wards for the treatment of typhoid patients, having accommodation for six male and six female sufferers. Each ward is complete in itself, having its own kitchen, bathroom, and other conveniences. Mr. F. H. Hare, the surveyor to the Mirfield District Council, has prepared the plans for the additions, which, with the furnishing of the administrative block, cost about £1,600.

A Sanatorium at Birch Hill, Frodsham, is being erected. Four bungalows scattered in the forest will accommodate four patients in each. In the hospital there are to be two large sitting-rooms. Accommodation for twenty-five patients will be provided by ten double-bedded rooms and five single-bedded rooms. There is to be a balcony on the first floor, where beds can be brought out if the weather is favourable. The buildings will cover five acres, and 25 acres have been provided for recreation purposes; the whole of this has been planted with trees. The sewage is destroyed by bacteria beds.

The Glasgow and West of Scotland Technical College Architectural Craftsman's Society held a meeting on Friday, 22nd ult., when papers were read by Mr. Robert Stuart, of Herbertson and Sons, wrights, and Mr. William H. Baxter, on the subject of "Temporary Carpenter Work." Mr. Stuart treated of the construction of crane seats and gabbert scaffolds. With regard to crane towers, he advocated that the centre tower, which contains the mast, should be 14ft. square instead of 10ft. or 12ft. to ensure there being as little overhang of the crane as possible, and the mast, he was of opinion, should be in two or three thicknesses well banded and bolted together. As to gabbert scaffolding care should be taken that there be sufficient space provided between the timbers and the wall in order that, in the slight swaying which takes place no injury was done to the stone or brickwork. Little or no nails should be used in the fixing of scaffold timbers, as they entailed great difficulties and danger to workmen in the taking down, bolts being used in all cases for this purpose. Mr. Baxter, in the course of his remarks, which were confined to the construction of temporary stand, made reference to the Glasgow Exhibition work of this kind, and dealt with numerous types for different conditions and purposes. The lecturer was of opinion that round timbers could be used advantageously and with decided artistic effect—Norway poles being cheaper than three thicknesses of battens, as commonly used here, and with the bark intact, could be treated in picturesque fashion with little difficulty. Mr. Baxter also dealt minutely with various formulæ for the calculations of strengths of timber supports.

A Portable Pump.—A saw mill at Archangel, Russia, has just been supplied with a pump of the same design as those employed in South Africa for supplying the troops with water. This is of the Merryweather "Valiant" pattern, capable of discharging water at the rate of 200 gallons per minute. The machine is light and portable, can be got rapidly to work and is available for all kinds of pumping purposes, including water supply, fire extinguishing, &c.

The Institute of Sanitary Engineers.—At a meeting of the election committee held on the 13th ult. the following gentlemen were elected as Associates:—Messrs. F. Bovey, Holloway; J. Buckeldee, Hillingdon; and J. Whittaker, Pleasington. At the examination in sanitary engineering held on the 22nd and 23rd ult. the following passed, qualifying for associateship:—Messrs. W. J. Lane, Croydon, and R. J. McKenn, Manchester.

Building at Darlington.—In connection with the large locomotive engine works which are being built on the Springfield Estate, near Darlington, by Messrs. Robert Stephenson and Co., Limited, there is a project for the erection of 582 houses on land in the locality. The company have had plans drawn of various kinds of houses and cottages, including semi-detached buildings of a somewhat better class. The land will be sold to builders and others to carry out the scheme upon the scale and plans laid down by the company.

Newport (Mon.) Technical Institute Competition.—The Technical Instruction Committee last week, upon the recommendation of Mr. S. B. Russell, A.R.I.B.A., London, the assessor in this competition, decided to award the first prize of £50 to Mr. Norman M. Brown, architect and surveyor, 156 Dock Street, Newport, and the second prize of £25 to Messrs. Swash and Bain, architects and surveyors, Midland Bank Chambers, for designs of the Proposed new Technical Institute in Clarence place. The awards are subject to confirmation by the Town Council.

New Bonded Warehouses at Edinburgh are proposed to be erected by Messrs. Andrew Usher and Company at St. Leonard's from plans prepared by Messrs. Leadbetter and Fairley, architects, of 17 Young Street, Edinburgh. The present area is to be increased and the new premises will extend to a distance of 750ft. with an average width of 70ft. The eastern portion of the buildings will be occupied by bonded warehouses five floors in height. This part will measure 304ft. and will average 65ft. in width. The northern portion, measuring 245ft. by 71ft., will be occupied by cellars, bottle-washing premises, &c., on the ground floor, and on the second the dispatch department. The centre of the building will consist of vatting and mixing cellars, a large covered court, offices for the company and excise, &c. The elevation to the Queen's Park will be built of stone. The reconstruction of the premises is expected to cost about £25,000.

Use of Defective Mortar.—The Paignton District Council recently took action relative to the use of alleged defective mortar in house building, directing that samples of the mortar being used by all the builders in the town should be taken. This was done, and one sample was reported by the independent expert to whom it was submitted to be so defective that the Council had no alternative but to prosecute. This course was the more imperative seeing that the builder complained of was a member of the Council. Had they allowed the case to pass unnoticed, in the face of the analytical and expert reports they had, they would have been deserving of censure, and would have exposed themselves to the charge of allowing members of their own body to ignore the by-laws. But the expert evidence for the defence was so strong in declaring that the mortar used in the building was good that the Bench had no hesitation in dismissing the case. Apparently a larger sample should have been taken to make it quite clear that it was representative of all the mortar in the heap. It would also appear to be advisable that the by-law should state definitely what constitutes good mortar.

AN AMERICAN THEATRE.

THE Colonial Theatre, Boston, U.S.A., designed by Mr. C. H. Blackall, has just been erected. A wrought bronze and glass canopy projects over the sidewalk to the curb line. The vestibule is an apartment 19ft. wide and some 60ft. long, the walls being covered with marble to a height of 9ft., with a marble cornice above resting upon heavy pilasters of Brescia marble with bronze capitals. From the marble cornice springs an elliptical panelled ceiling. The floor is of mosaic, consisting of a plain centre with a border 2ft. wide, closely following the spirit and style of the celebrated Pompeian mosaic now preserved in the Naples Museum. The wall space between the top of the marble dado and the cornice is decorated with festoons of fruits and flowers in the Pompeian style. Beyond the vestibule is the main foyer. This apartment, measuring about 18ft. in width by nearly 100ft. in length, is carried out in Louis XV style, all the finish being in satinwood. Opening from the foyer is the ladies' room, measuring approximately 20ft. by 30ft., carried out in Louis XV. style. The stairways leading from the main floor to the balcony are of bronze, finished in design to correspond with the rest of the work. In style, the design of the interior of the theatre may be characterised as being in the sixteenth-century Italian Renaissance details, the scheme of the decoration and the general design being in the spirit of such historic structures as the Vatican, portions of St. Peter's and the Farnese Palace. The elaboration, of course, is concentrated about the proscenium, which measures 37ft. 6in. wide and 38ft high. The scheme of decoration of the interior is in a strong green or blue and gold predominating note. The blue, green and gold is carried through all the decorations of the house, so as to give a full, rich aspect to the interior entirely opposed to the white and gold style which has been a favourite scheme of decoration in past years, the idea being to produce a general richness of effect. The woodwork of the seats is of deep rich rosewood, and the upholstering is of real leather of a dull green colour. The framework of the chairs is of electro-bronze.

There are four curtains. The fireproof curtain is of asbestos, while the main curtain is a single sheet of rich royal crimson, perfectly plain. The act-drop is of tapestry, painted by H. B. Pennell, and in addition to this there may be a curtain of plain black velvet which will be used in making quick changes between the acts. There are thirty-six dressing-rooms for the artists, besides two special dressing-rooms for the stars, a large ballet-room and two large apartments for the supers. The stage itself is specially constructed to accommodate large productions, and the rigging and the construction of the fly galleries are of sufficient strength to safely take care of more than 50 tons of scenery at any one time. There is a depth beneath the stage floor of 25ft., and a height above the stage level to the gridiron floor, to which the ropes are attached operating the scenery, of 77ft. The theatre is equipped throughout with a full complement of automatic fire-alarms, automatic sprinklers, standpipe, and hose, and all the latest and most approved devices for safety. For the lighting of the stage a capacity of more than 4,000 electric lamps is required. The border lights and footlights are arranged in four colours, red, yellow, blue, and white, each colour being controlled by a separate dimmer, so that the lights can be raised or lowered at will, and for the control of all these lights a special and unusual switchboard has been designed by the Erickson Electric Equipment Company. This board is of an entirely new design: instead of the usual arrangement of jack-knife switches and rotary dimmers, which would involve a switchboard 8ft. or more in length, and make it extremely difficult of control by the operating electrician, the board consists simply of a bank of push buttons arranged on a table or ledge, 6in. or 8in. wide, and 2ft. or 3ft. long. These push buttons, which are operated much like the keys of a typewriter, control a series of valves through which air under a high pressure is carried to the actual switchboard in the basement, where the levers are pulled or the dimmers rotated at the will of the operator on the floor above.

The heating and ventilation of the theatre have received the most careful consideration. A powerful electric fan in the sub-basement draws air from out-of-doors and forces it over a series of steam-pipes and into the space immediately under the auditorium, the whole of this space serving as a large heating chamber, the air being maintained by the fan under sufficient pressure to force its way up into the various portions of the house. The air enters through the legs of the seats all over the floor of the house, and also comes out through the face of the risers of steps of the balcony, besides which special ducts of fresh air are carried up each side of the proscenium; and then, to prevent the draughts which are so common in theatres, additional reheating coils are placed each side of the orchestra. For the removal of the vitiated air there are large exhaust registers in the ceiling under the gallery connecting to cross-ducts leading up through the rear wall to the space over the, auditorium. Also, there is provided, in connection with the ceiling decoration, ventilating openings as a part of the decorative design through which the air can escape, the total area of these exhausts in the ceiling alone being more than 100 square feet. Over the auditorium ceiling there are lines of huge girders supporting the six storeys of the office building above. Between these lines of girders ample space is allowed for the passage of the exhaust air under the auditorium, which, after escaping through the ceiling outlets, is led into a large chamber in which is a fan, a duplicate of the fan which is in the sub-basement, and this exhausts the air and delivers it up a shaft measuring something over 125 square feet in area, and carried above the roof of the office building. The heating and ventilation system is based on the supply and removal of 50 cubic feet of air per minute to each occupant of the house.

ITALY'S ARTISTIC REMAINS.

THE adequate preservation from destruction by individual owners of ancient buildings and monuments is one of peculiar difficulty in a country like Italy, which is full of remains of the highest interest. Our Consul in Naples, in a recent report, says that year by year now a church, now a gateway of a castle, or even the castle itself, is declared to be a national monument. Treasures bought by dealers from remote villages are constantly pounced upon, and permission to export them is refused. No picture may leave the country without being submitted to experts, who have to decide whether it forms part of the history of the country or is in itself of such artistic value as to necessitate its retention. At Naples, and probably in all the important towns of Italy, there is a special commission consisting of sixteen members, presided over by the Syndic, who are appointed for four years. It is the duty of this commission to discover interesting things in the city which have not been noticed before, to prevent the disfigurement of those already under their care, and to keep the whole in order and repair. The Naples Commission was established in 1874, and has lately published its proceedings to the end of 1898 In these twenty-four years it has done much excellent work, having rescued many interesting and beautiful fountains which were in neglected streets and transferred them to worthier localities. It has also saved a vast number of frescoes, cleaned off the whitewash with which they had been smeared, and opened them to the public for exhibition. Above all, it has saved a noble gateway of Alfonso of Aragon from destruction.

A Carnarvon Improvement.—The Carnarvon Town Council propose to demolish a slum area known as Baptist Street, and a couple of courts leading therefrom, and construct thereon a new and wider street. The outlay contemplated amounts to £3,500.

Trade and Craft.

"Teon" Belting.

The "Teon" belting made by Messrs. Fleming, Birkby and Goodall, Limited, of Halifax, has established for itself a reputation for excellence. It is a composite belt. The basis is a specially woven fabric, without joint or seam, which is built up in plies and then cemented together under great pressure. The cement is a secret preparation and is the prime factor in enabling the belt to withstand all shocks and strains. No ingredient used in this cement is influenced by any heat under 230 degrees Fahr., and even at a higher temperature the cement is unaffected in its adhering power. Careful tests have been made with this belting, which has been found to resist the action of steam, oil, acid, alkali, and water; so that it is very sound and durable. Every belt is passed through a specially devised stretching apparatus, thus taking out practically all "stretch." The manufacturers give the following very satisfactory guarantee: "We make no extravagant pretensions for 'Teon,' but are prepared to stand by all we claim for it, and if after trial under conditions which, having been accurately explained when the order was given, a 'Teon' belt should prove a failure, we shall be willing to replace the same with a new 'Teon' belt free of charge as proof of our good faith. Should any dispute arise in regard to this guarantee, we will accept the decision of an arbitrator to be mutually agreed upon."

Commercial Enterprise.

It is a feature of the commercial life of to-day that the influential firms whose names are now household words should continue to grow bigger and bigger. This is proof that their productions win for them, year by year, new clients and new business; and as an inevitable result it becomes imperative from time to time to make extensions of premises. An instance of the kind has just occurred in the important business locality of Hampstead Road, where the ever-growing business of those well-known furnishers, Messrs. Oetzmann and Co., has necessitated the erection of a new annexe. It extends down Drummond Street, at the side of the familiar premises at 62-79 Hampstead Road, and consists of seven spacious floors crowned by an electrically-lighted cupola. The annexe comprises some fine show-rooms for the Oriental and British carpets and floor-coverings of which Messrs. Oetzmann and Co. have so extensive a stock; two large show-rooms devoted to antique furniture and decorative objects; other spacious show-rooms for modern furniture; and a special show-room in which are hundreds of specimens of reproductions of old carved black oak furniture. As regards pianos, Messrs. Oetzmann & Co. give their customers every facility for making a wise choice, having devoted a large show-room where instruments (both new and second-hand) by all the leading makers can be compared side by side. The top floors are reserved for upholstery and bedding manufacture, and the basement for export packing. Messrs. Oetzmann's stock of furniture is always noted for being cheap, good and artistic, and their establishment is more than ever worth a visit now that they have thus added to their already extensive premises.

Masters and Men.

A Claim by Plasterers was made recently that a trained plasterer should be employed to do the concreting and to lay the blocks of electric-tram tracks at Cardiff. The Public Works Committee, having considered a report on the subject by the borough engineer, has decided in the negative. It was the opinion of the majority of the committee that the work of preparing the tracks can be, and is being, efficiently performed by men who are not plasterers in the ordinary sense, but are styled by the borough engineer "concreters and block-layers."

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the Work.

BEWDLEY.—For the construction of two covered reservoirs, the supply and laying of 9¾ miles of water-mains, the sinking of a well, building engine-house, and for other work connected with the supply of water to Bewdley, for the Corporation. Mr. R. E. W. Berrington, engineer, Wolverhampton:—

Morrison & Mason, Ltd., Polmadie, Glasgow	£15,962	8	9

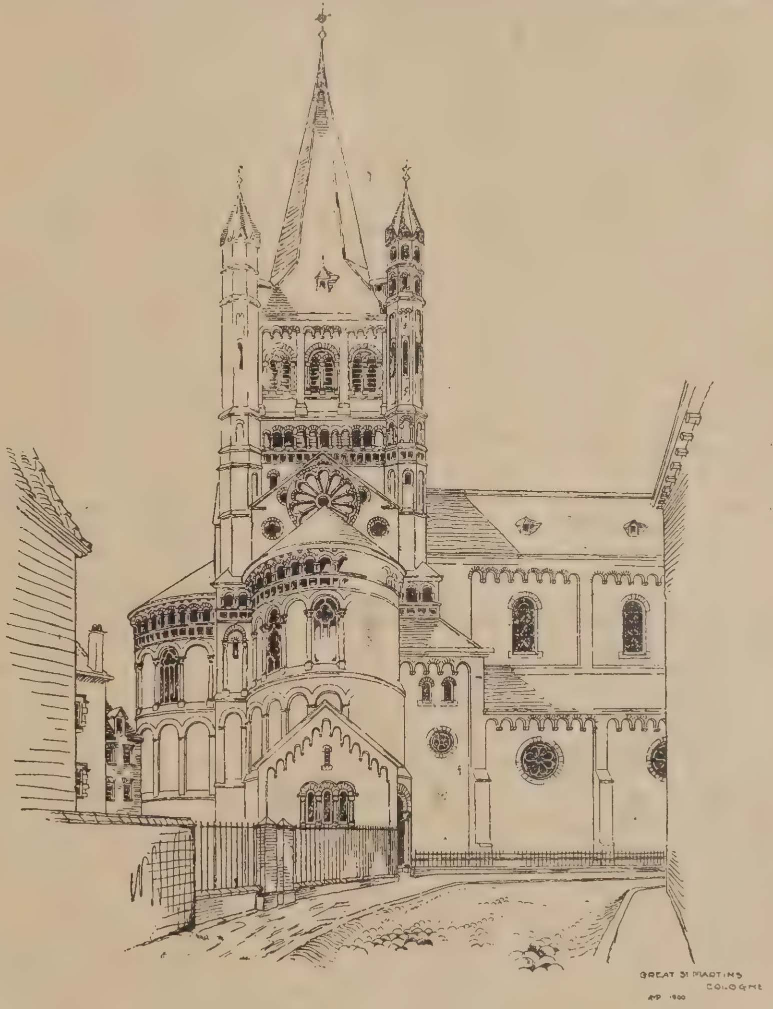
An Architectural Causerie.

Done. When the schemes for tampering with St. Dunstan's Church, Fleet Street, and St. Martin's Church, Trafalgar Square, were first proposed we protested strongly against them and pointed out how they would disfigure those two buildings. Since then the "improvers" have carried out their work. Of the two, St. Dunstan's Church has fared much the worse, for the adjoining insurance offices have now been extended over its western forecourt, the new light-coloured stonework abutting against the weathered tower and entirely spoiling its lines. There, in Fleet Street, is a glaring example of vandalism, one of which the insurance company should be ashamed; but we doubt not that they will consider "business requirements" a justification for anything. At St. Martin's Church the contractors are busy completing the alteration of the steps. It would be extreme to say that they have spoiled the western setting, but they certainly have marred it, and done so when there was really no need. A small strip has been added to the pavement at the expense of the landing which was such a pleasing characteristic of the steps of Gibbs' church. It is needless to dilate on this matter now. The steps have been altered. We simply record the fact. The pity of it is that an influential council in the world's greatest city should be so indifferent about those few buildings under its care which can justly lay claim to architectural merit.

St. Martin's, Cologne. The sketch of St. Martin's Church, Cologne, illustrated on this page, was made by Mr. A. M. Peart whilst on one of Mr. Middleton's Easter tours in Belgium. The date of the building is 1150-70. Another drawing by Mr. Peart, made on the same tour, of the church of St. Pierre, Louvain, was reproduced in our issue for October 17th last.



DRAWN BY A. M. PEART.

Sash Fasteners. Good Sir Francis Bacon affirmed that those who are prone to invent are also prone to believe, and the saying will be held sadly true by those who know something of the vagaries of inventors. There are many kinds of articles and devices which form every year the subjects of useless patents, and of these, sash fasteners may be taken as an example. Month after month prolific minds devise these articles and waste their money on patenting them. We would wish it were otherwise and that those microcosms of ingenuity were first put to the comparative test of a search at the Patent Office, for this (provided it is thoroughly done) is one of the best methods of showing the force of Solomon's remark "that there is nothing new under the sun" and also of showing what fallacies are pursued by inventors and what wild-goose chases they are led into. There have already been so many sash fasteners invented that not only is it exceedingly difficult to think of any genuine improvement, but manufacturers and retail salesmen look askance at all newcomers, and smilingly point to the numerous packets of the old snap fasteners that still find the readiest market; in fact, the representative of a well-known firm told us recently that the illustrations of American and similar "fancy" fasteners in their catalogue were simply put there with the object of making a good "show," but that they very rarely sold any of them! A few years ago several prominent newspapers in various parts of the country—we forbear to mention names—implicated themselves in a competition for a good sash fastener which, though it doubtless brought money into the coffers of the particular patent-agents concerned, did considerable harm by adding hundreds to the already ridiculously large number of patents for these window fittings. We have already pointed out in these columns that the proper way to approach invention is not to rush pell-mell into the patent-agent's arms with an utterly useless device, but to first ascertain a need, then determine what has already been done to fulfil it, and then develop your own idea. Though it sells so readily, there is little doubt that the old form of sash fastener is deficient in many respects, and makers are continually being flooded with offers of new devices. A few they adopt, sometimes successfully, often without profit to themselves. And thereby hangs a tale. We would therefore urge all those who are persuaded they have a good invention to look well into the matter, in the manner suggested, before spending money on provisional or final protection. About a week ago, in the House of Commons, Mr. Herbert Lewis asked the Chancellor of the Exchequer whether it was a fact that British patents "are taken out at the risk of the applicants, it being left to every person to protect his own rights," and whether "Great Britain is the only country which issues patents without satisfactory proof that the inventions described have not been previously patented." Mr. G. Balfour replied for Sir M. Hicks-Beach. After remarking that there "certainly are countries other than Great Britain which make no search for novelty," he added: "The subject of search among prior specifications has, however, engaged the attention of the Board of Trade, and I would refer the hon. member to the report of a Departmental Committee presented to Parliament this Session." This committee recommended that an investigation should be made to ensure that the granting of a patent is a guarantee of novelty, as in America. But till that happy state is arrived at, inventors need to exercise particular care.

THE ARCHITECTURAL SURVEY.*

A SCOTTISH SCHOLARSHIP.

By ANDREW MUIR.

THE word "survey" brings to the mind of most people a vision of lines of red and white poles and sundry Government officers with theodolites and measuring chains. But with these the Architectural Survey has no connection. It is a scholarship given annually to two students of the School of Applied Art in Edinburgh for the study of Scottish art throughout Scotland. It is nearly six years since this scholarship was begun, and nine students have now been employed in making this most interesting record of national art. These are primarily students of architecture; they should also be photographers, cyclists, good steeplejacks, able to erect a scaffold, make a cast, or turn their hand to anything that may be required to be done in the way of their work. A large part of Scotland has now been gone over, chiefly the Border districts; last year Ayrshire, Lauder, Jedburgh, Stirling and Iona were visited.

I will endeavour to give a summary of the most interesting points in connection with these places, as it is impossible in the time at my disposal to give anything like a complete description of them.

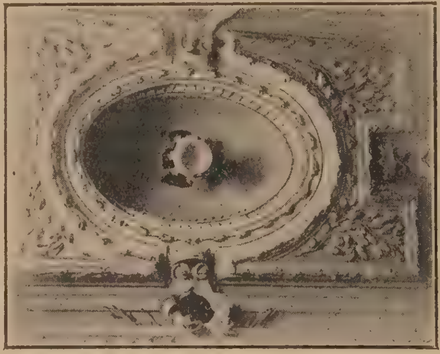
We began our wanderings in April after a preliminary visit to the sweet-scented district of Auld Reekie known as the Cowgate.

This was, in the days of the first six Stewarts, one of the most fashionable and aristocratic quarters in Edinburgh, but it has now fallen from its high estate. Nevertheless, many interesting relics and memories of bygone prosperity remain, though they are being gradually removed.

Here is the chapel of St. Mary Magdalene, whither we went to copy the four stained-glass panels, which are the only fragments of pre-Reformation ecclesiastical coloured glass remaining in Scotland. The chapel was founded in 1503 by a burgess of the city, Michael Macquhen, and his wife Janet Rynd.

A Maison-Dieu was previously built on the site, which, having become ruinous, was superseded by this chapel and hospital, dedicated to Mary Magdalene. The chapel was left in trust to the Corporation of the Hammermen.

The initials of the founder and foundress are seen in the lower panels of the window, and above are the arms of Mary of Guise, and the Scottish lion.



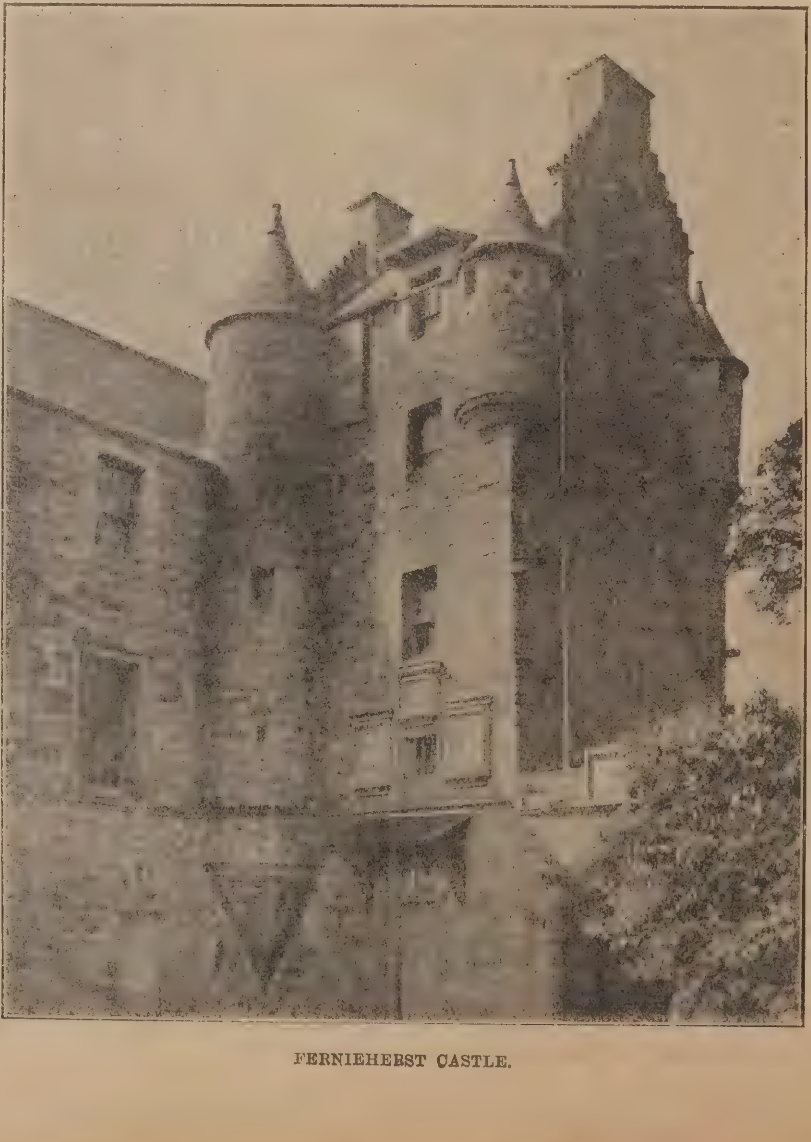
STAIRCASE CEILING, THIRLESTANE CASTLE.

Several objects of interest are in the chapel. The bell, which is still rung weekly, is said to be nearly pure silver, and was cast in Flanders and hung in 1632. There is an inscription on it:

SOLI . DEO . GLORIA . MICHAEL . BURGERHUYS . ME . FECIT . 1632;

and below,

God Bliss the Hammermen of Magdalene Chapel.



FERNIEHERST CASTLE.

Two chairs, marked Clerk and Treasurer, are still in the room under the tower. These would be used at the meetings of the Hammermen's Guild. There is also a tomb inscribed with Gothic lettering which is at present covered in with a wooden platform, and it has been suggested that this may be the top of an altar which would be uncovered were the platform removed. The walls are covered with curious wood panels on which are painted the names of those who left money to the Guild.

Having spent a few days in these historic but somewhat sooty surroundings, within sound of a gasping gas-engine, we journeyed to Ayrshire and the land of Burns. Here we found delightful quarters at Old Cumnock, and rode daily from there to Dumfries House, a seat of the Marquis of Bute. This is an eighteenth-century mansion, built by the Brothers Adam, and contains several plaster ceilings of that period, somewhat French in style. We measured these, and made this the centre for a number of interesting rides, architectural and otherwise.

We visited the sweet Vale of Afton, made famous by Burns, and found it altogether worthy of his praise. One of our tours brought us to Cessnock Castle, near Galston, originally called Galston Tower. The present house is Renaissance of the seventeenth century, and possesses a considerable amount of detail. There are two staircases in the angles of the quadrangle. That in the south-east angle is octagonal, finished with a balustrade on the top, and contains the entrance doorway with a pediment and panel over it. The hall is on the first floor, and has a fine oak ceiling with open beams and boarding painted with figures and Renaissance designs.

The colours of these are low-toned—red, black, and green—the faces and busts being a flesh colour. There are also parts of a plaster ceiling which have been taken down and placed in another apartment. These are very Scotch in character, and belong to the naturalistic style so much employed in the seventeenth century. One of them is dated 1680.

On another occasion we visited the town of Mauchline, famous for its three belles. We did not see the belles, but we saw the old tower, part of a fifteenth-century priory of the monks of Melrose.
